http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\_QA.htm 1 of 15 10/6/2005  
1:40 PM United States Department of Agriculture Food Safety and Inspection Service Office of Policy and Program Development Washington, D.C. 20250-3700 Labeling and Consumer Protection Proprietary Mixture Suppliers and Manufacturers Questions and Answers March 17, 1995 To: Proprietary Mixture Suppliers and Manufacturers This letter is intended to supplement the previous letter to the Proprietary Mixture Suppliers and Manufacturers (dated November 1, 1990), and FSIS Directive 7237.1 (Rev. 1), by conveying a compilation of updated questions and answers (Enclosure) pertaining to ingredient review, use, and labeling. The questions and answers are those frequently posed regarding current Agency issuance's on ingredient policies, e.g., proprietary mixes and reaction flavors, and are updated to reflect rule changes promulgated on January 6, 1993, by the Food and Drug Administration on ingredient labeling. Questions regarding ingredient mix formulation review, use, and labeling may continue to be sent to the Labeling and Additives Policy Division (LAPD) at the following address: Robert C. Post, Ph. D., Director USDA, FSIS, OPPD Labeling and Consumer Protection Staff 1400 Independence Avenue, SW, Room 602 - Annex Building Washington, DC 20250-3700 As always, proprietary ingredient mix formulations that are submitted by companies to the Agency for review in order to respond to questions are exempt from mandatory disclosure under the Freedom of Information Act, 5 U.S.C. 552 (b) (4), and will only be used to determine proper listing of the ingredients on meat and/or poultry product labels.", "Proprietary Mixture Suppliers and Manufacturers - FAQ's  
http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\_QA.htm 2 of 15 10/6/2005  
1:40 PM Sincerely, Robert C. Post, Ph. D., Director Labeling and Additives Policy Division Enclosure [return to top of page] QUESTIONS AND ANSWERS RELATING TO USE AND LABELING OF INGREDIENTS, INCLUDING FLAVORINGS, PROPRIETARY INGREDIENT MIXES, INGREDIENTS IN STANDARDIZED AND NON-STANDARDIZED FOODS, AND PROTEIN HYDROLYSATES Table of Contents I. Labeling of Flavorings II. Proprietary Ingredient Mixtures and Ingredients in Standardized and Non-Standardized Foods III. Labeling of Reaction Flavors IV. Labeling of Protein Hydrolysates I. LABELING OF FLAVORINGS 1. Question: What commonly used ingredient may be designated as \"flavors,\" \"flavorings,\" \"flavoring,\" or \"flavor?\"", "Proprietary Mixture Suppliers and Manufacturers - FAQ's  
http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\_QA.htm 3 of 15 10/6/2005  
1:40 PM 2. 3. 4. 5. 6. 7. 8. Answer: Spices, spice extractives, essential oils, oleoresins, onion powder, garlic powder, celery powder, onion juice, and garlic juice. Spices, oleoresin, essential oils, and spice extractives are listed in 21 CFR 172.510, 182.10, 182.20, 182.40, 182.50, and 184. Question: What commonly used ingredients, which have been designated as \"flavors\" prior to March 1990, must be designated by their common or usual name? Answer: Hydrolyzed (source)"]

proteins (e.g., hydrolyzed corn gluten, hydrolyzed casein, hydrolyzed wheat protein, and hydrolyzed milk protein), gelatin, hydrolyzed meat and meat by-products (i.e., \"hydrolyzed [species and tissue of origin]\"), autolyzed yeast, and autolyzed yeast extract are some examples. Question: Can dry meat or poultry stocks, dried broth, extracts, and dried beef plasma be designated as \"flavors?\" Answer: No, because dried stocks, dried broths and extracts, and blood fractions are of animal origin, they must be designated as dried (species) stock, dried (species) broth, (species) extract, or dried (species) plasma. Question: Can commonly used organic acids be designated as flavors? Answer: No, because they have restricted uses and use levels, commonly used acids must be designated by their specific name (e.g., ascorbic, citric, lactic, phosphoric, etc.). Question: Can fruit (or vegetable) juices, purees, powders, and similar ingredients be designated as \"flavors?\" Answer: No, with very few exceptions, these ingredients are foods that have nutritional value and may not be designated as \"flavor\" and must be listed by their common or usual name, e.g., tomato powder and lemon juice. However, powdered onion, powdered garlic and powdered celery, as specifically cited in the regulations (9 CFR 317.2 (f) (1) (i) and 381.118 (c) (2)), may be labeled as \"flavor,\" \"natural flavors,\" or similar terms. Onion juice and garlic juice, according to FDA, may also be termed \"flavor,\" etc. Question: Must specific ingredients that meet the definition of \"flavor,\" e.g., rosemary, and are not proteinaceous, be identified on the label application form? Answer: No. Spices, oleoresins, essential oils, and spice extractives may be grouped together and listed as \"spices\" or \"flavor\" or similar terms without specific names. If color is imparted, they must be designated as, for example, \"spice and coloring\" or by their specific name(s), e.g., turmeric. Question: Can the use of mustard as part of the ingredient mix be designated in the label application as \"spice?\" Answer: Yes, mustard may be listed in the ingredient statement on the label of a meat or poultry product as \"mustard,\" \"spice,\" or \"flavoring\" (see 9 CFR 317.2 (f) (1) (i)). Question: Can \"deflavored\" or \"decharacterized\" mustard (or other spices) be used as an ingredient in meat or poultry products? If so, how should it be designated in the ingredient statement? Answer: Deflavored (or decharacterized) mustard is an acceptable ingredient in the preparation of meat or poultry products, under the conditions of use that are acceptable for spices or flavorings.", "Proprietary Mixture Suppliers and Manufacturers - FAQ's

[http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 4 of 15 10/6/2005  
1:40 PM \u2022 9. 10. 12. 13. 14. 15. including level of use. When used in a meat or poultry product, deflavored mustard may be designated as \"deflavored mustard,\" \"deheated mustard,\" or \"deactivated mustard.\" According to FDA, deflavored mustard, however, may not be designated as \"mustard,\" \"spice,\" or \"flavoring.\" The same would hold true for other spices. Question: If the processor declares spice(s) or spice extractive(s) on the meat or poultry product label, is it necessary to identify the specific spice(s) and spice extractive(s) on the label application form? Answer: Generally, the processor need not identify each spice or spice extractive and the quantity of each on the label application form. As always, the total quantity of all spices versus all spice extractives will need to be indicated on the label application form to determine order of predominance for the different terms, i.e., spice(s) and spice extractive(s). In addition, if the label is submitted by an establishment in a foreign country, each spice and spice extractive must be identified on the label application form by name because of differences between countries in regulations for these ingredients. Question:

Can paprika, saffron, and turmeric be designated as \"spice\" or \"flavoring\" on meat and poultry product labels? Answer: No. Paprika, saffron, turmeric, and extractives of these, according to FDA, are both spices and coloring, or flavoring and coloring and should be declared as \"spice and coloring\" or \"flavoring and coloring\" unless the specific spice or spice extractive is named in the ingredients statement. Question: Can annatto be designated as \"spice\" or \"flavoring\" on meat and poultry product labels? Answer: No. Annatto may be called either \"annatto\" or \"artificial color\" or \"artificial coloring\" but may not be labeled as spice or flavoring. Question: Does each constituent of ingredients designated, as \"artificial flavor(s)\" have to be identified on the label application form? Answer: No. It is not necessary to identify the specific components of artificial flavors when the substances meet the definition in 21 CFR 172.515 and 182.60. Question: Do ingredients that are designated as \"spice(s),\" \"flavor,\" etc., in FDA-regulated foods that are used as components in meat and poultry products need to be identified on the label application form as to the specific spices or flavors used? Answer: No, foods produced under FDA jurisdiction (e.g., sauces, vegetable mixes, baked beans) that are purchased and used as components of meat or poultry products need not identify the flavors on the label application. The ingredients listed on the label of the FDA regulated product may be listed as such on the label of the meat or poultry product because it is expected they will be in conformance with FDA ingredient labeling rules. Question: When does a processor need to provide specific \"flavor\" component information on purchased products? Answer: Specific information need only be provided if the product is a seasoning ingredient or if there is reason to suspect that the purchased product contains ingredients that are inappropriately designated as \"flavor,\" etc. Question: Does the Agency recognize a de minimis (minimal) level below, which a flavoring ingredient need not be declared?", "Proprietary Mixture Suppliers and Manufacturers - FAQ's

[http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 5 of 15 10/6/2005  
1:40 PM Answer: No, there is no de minimis level at which a flavoring ingredient need not be declared by its common or usual name. 16. Question: How much information must suppliers of natural flavors, such as \"tomato flavor\" or \"egg flavor,\" provide? Answer: Suppliers of these types of ingredients must supply FSIS, at the time of label approval, with the identification of all constituents (ingredients) of that flavor. 17. Question: Can natural smoke flavoring be listed as natural flavor? Answer: No, the labeling of natural smoke flavorings is covered by 9 CFR 317.2 (j) (3) and 381.119 (a) and by Policy Memo 117, \"Smoke Flavoring.\" Natural smoke flavoring may not be listed as \"natural flavor\" or \"flavor\" in the ingredients statement. It may be declared as \"natural smoke flavoring\" or \"smoke flavoring.\" Artificial smoke flavoring must be labeled as such. 18. Question: Would a distillate of acid, alcohol, or food be considered \"flavor?\" Answer: Yes, distillates from acid, alcohol, or food that are the result of a distillation process, can be designated as \"flavor,\" if they contain solely the flavoring constituents that are not of nutritional consequence. That is to say, no components of the substrate are present \u2013 only the chemical constituents that provide flavor, e.g., aldehydes, ketones, etc. 19. Question: Can cultured, fermented, or enzyme-modified products be designated as \"flavorings?\" Answer: No. According to FDA, these ingredients must be designated by their common or usual name, e.g., \"cultured whey\" and \"enzyme modified cheddar cheese (sublisted ingredients).\" 20. Question: Can flavoring compounds which are separated from fermented products be designated as \"flavors\" (e.g., aldehydes, ketones, diacetyl, etc.)?

Answer: Yes, provided the mixture contains only the flavoring compounds and does not contain the substrate from which the flavoring compounds were removed.

21. Question: How would the "natural" versus "artificial" status of a flavoring compound be verified and by whom?

Answer: FSIS regulations do not provide criteria for differentiating between "natural" and "artificial" flavoring compounds (e.g., "natural" diacetyl). Determination for proper nomenclature can be obtained from the FDA.

22. Question: Can sandalwood extract or yellow sandalwood may be designated as "flavor" on labels of meat and poultry products?

Answer: White sandalwood extract or yellow sandalwood may be designated as "flavor" in the ingredients statement. FDA does not permit the use of red sandalwood extract in food, with the exception of alcoholic beverages.

[return to top of page]", "Proprietary Mixture Suppliers and Manufacturers - FAQ's [http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 6 of 15 10\6\2005 1:40 PM II. PROPRIETARY INGREDIENT MIXTURES AND INGREDIENTS IN STANDARDIZED AND NON-STANDARDIZED FOODS

1. Question: Does a proprietary ingredient mix formula have to be reviewed approved by FSIS, LAPD, before it can be used in meat or poultry products?

Answer: No. Prior review and approval of proprietary ingredient mixes intended for use in meat or poultry products have never been required by the Agency. A letter of guaranty and a complete bulk label that lists all ingredients of the mix in descending order by common or usual name have always been a means of confirming the identity of ingredient mixes and assuring compliance with FDA ingredient rules and the rules of this Agency.

Percentages of individual constituents of a mix may appear on bulk labels depending on whether the ingredient is restricted in meat or poultry products and\or the meat or poultry manufacturer intends to use a composite approach to listing ingredients on the meat and poultry product label.

2. Question: Can processors submit their proprietary ingredient mix formulas to FSIS, LAPD, to be kept in confidential files for reference before or during the label approval process?

Answer: Yes. Processors may submit the proprietary ingredient mix formulas to FSIS. The formulas will remain I confidential files, as in the past, and will be used for the purpose of verifying the ingredients statements on labels for meat and poultry products.

3. Question: What proprietary mix formulas can be submitted to FSIS?

Answer: The formulas for mixtures of non-meat and\or non-poultry ingredients, e.g., breading mixes, seasonings, spices, marinades, flavorings, cures, and antioxidants, may be voluntarily submitted.

4. Question: Is there a prescribed format required for submission of proprietary mix formulas?

Answer: The suggested format for submission is a list of the following:

- (1) date of submission,
- (2) company name and mailing address,
- (3) technical contact person,
- (4) telephone number,
- (5) name of proprietary mixture (brand name, code, or other designation under which ingredient mix is marketed),
- (6) intended use and level of use,
- (7) statement of composition (list of the quantitative formula with percentages of each ingredient in descending order of predominance \u2013 provide a sublisting of any ingredients used to formulate another ingredient),
- (8) a description of the manufacturing process used to formulate the ingredient mix, including temperatures and time,
- (9) the proposed labeling of the mix in the meat\poultry ingredients statement, and
- (10) certification by a company representative (including name, signature, title, and date) that the description of the mix is accurate and complete, and that it is in accordance with FSIS guidelines and rules."

," "Proprietary Mixture Suppliers and Manufacturers - FAQ's [http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 7 of 15 10\6\2005 1:40 PM

5. Question: Does FSIS provide advisory letters to manufacturers who voluntarily

submit their ingredient mix formulas? Answer: FSIS will issue letters conveying labeling advice when specifically requested.

6. Question: When spices, such as rosemary and thyme, are listed on a proprietary mix label, must they be listed separately on the meat or poultry product label or can they be termed as spices or flavorings? Answer: Ingredients that are spices can be listed by their names, e.g., rosemary and thyme, or as "spices," "flavorings," or similar terms, regardless of the wording on the ingredient mix bulk label.

7. Question: If an ingredient mix is to be used in a product such as "Italian sausage," which must contain the spices, pepper and anise or fennel, as required by 9 CFR 319.145, should the label application list the total amount of spices and sublist each with its percentage? Answer: While it is not necessary to list separately or provide the percentage of each spice on the label submittal form nor to sublist each spice by common or usual name on the proprietary mix label, it would be useful to identify the required spices by name on the label application or on the ingredient mix label because labels for an "Italian sausage" in which the mix is used will not be approved unless the label application shows the mix contains the required spices.

8. Question: Is it necessary to disclose the individual percentage of each proteinaceous ingredient in a mix on the label? Answer: No, while each percentage disclosure for ingredient mixes that are allowed in moisture controlled products has been a practice in the past, we have reconsidered this requirement since publication of the "flavoring" and "added water" regulations (9 CFR 317.2 (f) (1) (i), 318.22, and 381.118) (c) (2)) in March 1990.

9. Question: When are ingredients considered incidental additives? Answer: Ingredients that are present in a meat or poultry product in an insignificant amount and have no functional or technical effects in the finished meat or poultry product may be considered incidental additives. The definition of incidental additives provided by FDA (21 CFR 101.100 (a) (3)) is applied to meat or poultry products. Compliance with these conditions is determined by the Agency (LAPD\FSIS) on a case-by-case basis by considering the use of the proposed incidental additive and the specific meat or poultry product formulation to which it is added.

10. Question: Are incidental additives declared in the ingredient statement? Answer: No, incidental additives are not required to be listed in the ingredients statement of meat and poultry product labels. Anticaking substances, as defined by FDA, such as silicon dioxide (used at less than 2 percent of a spice and seasoning blend), are examples of incidental additives frequently used in spices and seasoning blends. When meat and poultry processors use such spices in their products, they are not required to list the anticaking agent in the ingredients statement because it is present in insignificant amounts and because it no longer serves an anticaking function.

11. Question: What are "carriers?" Answer: Carriers are substances that are, in and of themselves, non-functional (i.e., inert) but which are used to carry and distribute functional additives added to meat and poultry product.","Proprietary Mixture Suppliers and Manufacturers - FAQ's [http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 8 of 15 10\6\2005 1:40 PM Functional additives which are frequently added to formulations through the use of carries are flavorings, antioxidants, and other substances which are used in very small quantities. The use of carriers assists in accurate quantitative measurement and in uniform distribution of the functional additive.

12. Question: Are carriers considered incidental additives? If not, how should carriers be labeled on meat and poultry labels? Answer: A carrier may be required to be designated in the ingredients statement of the product to which it is added unless it is determined to be an incidental additive. If the carrier is determined to be an incidental additive, it need not be designated on the finished product label. There is no precise

level at which the carrier becomes an incidental additive and the issue is handled on a case-by-case basis. 13. Question: Under what circumstances is the listing of carriers on the meat or poultry product ingredients statement required? Answer: In cases where the carrier performs a functional role in the product, the carrier is not an incidental additive and must be declared on the label of the finished meat or poultry product in accordance with labeling rules. However, when lactose, salt, and proteinaceous substances are used as carriers, they are not considered to be incidental additives and must be designated by their specific common or usual names on the meat or poultry product label. 14. Question: When is dextrose or sugar considered a carrier of spices? Answer: Dextrose and\or sugar are commonly used as carriers for spice extracts and resins of spices. The carrier must be declared in the ingredients statement of the meat or poultry product, except in those cases where a sweetening agent is used separately in formulating the meat or poultry product and the use of the spice mixture will not result in the quantity of the carrier being more than 0.75 percent of the product. When a determination cannot be made from the information on a label application, declaration is required. 15.

Question: Are there any situations when the label declaration of monosodium glutamate (MSG) as an added ingredient is not required? Answer: No, there is no established limit, below which, monosodium glutamate does not need to be declared on the label of a product to which it is added. Therefore, when monosodium glutamate is used as an ingredient it must be identified on the finished product label regardless of the amount used. 16. Question: Do FDA certified color additives and their lakes have to be individually declared in the ingredients statement? Answer: Yes. According to FDA rules (21 CFR 101.22 (K) (1), certified color additives and their lakes are distinct ingredients and, thus, must be declared individually, e.g., \"FD&C Red #40\" or \"Red 40,\" in the ingredients statement and not by a grouped term such as \"coloring.\" 17.

Question: Do FDA certified color additives and their lakes have to be individually declared when added to the casings for sausage products and the casings are removed but the surface color effect remains? Answer: Yes. Certified colors must be declared whenever used. In situations where colored casings on sausage products impart a color to the product, the manufacturer must continue to apply", "Proprietary Mixture Suppliers and Manufacturers - FAQ's

[http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 9 of 15 10\6\2005

1:40 PM the product name qualifier \"Casing Colored,\" and may either include the name of the certified color in the qualifier (e.g., \"Artificially Colored with FD&C Red #40,\") or may include it in the ingredients statement of the sausage product. 18. Question: Does an FD&C color, e.g., Red #3 or Red #40, have to be declared in the ingredients statements of meat and poultry products when it is added to cure mixes as a tint to distinguish nitrite from salt? Answer: No. The policy has always been that since the color does not function as a color additive in the meat or poultry product, it is considered to be incidental and does not require declaration. 19.

Question: How are non-certified color additives identified? Answer: Color additives not subject to certification may continue to be declared as \"artificial color,\" \"artificial color added, \" or \"color added.\\" Alternatively, such color additives may be declared as \"colored with , \" or \" color,\\" with the blank space filled in with the name of the color additive listed in 21 CFR 73, e.g., \"colored with annatto,\\" or \"caramel color.\\" 20. Question: When used as ingredients in meat or poultry products, do the common or usual names of ingredients of standardized FDA-foods and ingredients have to be listed? Answer: Yes. According to FDA rules (21 CFR 130.11), the ingredients of standardized foods must be (1) declared parenthetically following the name

of the standardized ingredient (i.e., \"component\" labeling), e.g., \"cheddar cheese (milk, enzymes, salt)\" or (2) declared by dispersing each ingredient in its order of predominance in the ingredients statement of the product in which it is used without naming the standardized food specifically (i.e., \"composite\" labeling). 21. Question: When used as ingredients in meat or poultry products, do the ingredients of non-standardized FDA-foods and ingredients have to be listed? Answer: Yes. FDA has always required the ingredients in non-standardized FDA-foods, e.g., egg products and Ricotta cheese, to be listed when used as ingredients in other foods. In the past, FSIS has allowed limited exceptions to the rule, however, after August 8, 1995, all meat and poultry products containing FDA components as ingredients must list all ingredients in those components. 22. Question: What non-standardized foods will require full declaration of ingredients after August 8, 1995? Answer: Soy sauce and Worcestershire sauce are examples of the non-standardized items used as ingredients in meat and poultry products that will need full disclosure of ingredients. 23. Question: What is the policy for declaring ingredients in cured meat products that are used as ingredients in other meat and poultry items? Answer:

Consistent with the recent FDA rule changes requiring the declaration of ingredients in all foods, FSIS is changing its policy on the use of cured meat products as ingredients to require the declaration of ingredients regardless of the use level. 24. Question: How would vegetable oils be listed in an ingredients statement in regard to source material? Answer: FDA regulations require that the source of specific fats or oils be identified. This provision is different with regard to Federal meat inspection regulations which permit the use of a general term such as \"vegetable oil\" (9 CFR 317.2 (f) (1) (iii), 317.8 (b) (21), 319.701). Therefore, \"vegetable oil\" is acceptable as an ingredient declaration and will continue to be acceptable until", "Proprietary Mixture Suppliers and Manufacturers - FAQ's

[http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 10 of 15 10/6/2005  
1:40 PM the meat and poultry products inspection regulations are amended accordingly.

25. Question: What is the acceptable designation of vegetable starches and starchy vegetable flours? Answer: In some cases, USDA regulations (e.g., the Tables of Approved Substances) require a specific source disclosure, e.g., \"pea flour.\" In many cases, however, the regulations use general terms, e.g., \"vegetable starches\" and \"starchy vegetable flour.\" Unless specified in FDA regulations, source labeling of starches is not required by FDA and, therefore, is not required by FSIS. Thus, terms like \"modified food starch\" are acceptable. 26. Question: Is it acceptable to use an \"and/or\" (or \"may contain\") approach to declare the ingredients of a FDA-foods or ingredient, e.g., ketchup, that is purchased from different manufacturers?

Answer: The use of \"and/or\" labeling will be permitted for the declaration of ingredients in purchased FDA-foods and ingredients in accordance with FDA\u2019s regulations, only if they are listed as components in the ingredients statements of meat and poultry products in which they are used. 27. Question: Can the use of \"and/or\" (or \"may contain\") labeling be applied to minor ingredients, i.e., those present at 2 percent or less, of products such as cured meat or poultry products or such products that are further processed (i.e., sliced, diced, etc.) and packaged? Answer: The use of \"and/or\" labeling will be permitted for minor ingredients of a component of meat or poultry products in accordance with Policy Memo 072, \"Composite Ingredient Labeling.\" Thus, the use of \"and/or\" labeling will be permitted for cured meat components, such as bacon ends and pieces, and ham, as well as for non-meat components, such as soy sauce. Additionally, cured meat poultry items, e.g., ham, with variations in minor

ingredients in their formulations, can be sliced, diced, etc., and bear a label containing an \"and\or\" or \"may contain\" statement in the ingredients listing. 28. Question: Is the term \"seasoning\" an acceptable ingredient designation on meat and poultry product labels? Answer: No. \"Seasoning\" is not established by FDA as a common or usual name. Because it is a very general term, whenever \"seasoning\" is used in the ingredients statement, its components must be identified as a sublisting. 29. Question: Can approved phosphates be collectively designated as \"sodium phosphates\" or \"potassium phosphates,\" as the case may be? Answer: Yes. As a convenience to meat and poultry processors, we are continuing to allow these substances to be declared on labels of meat and poultry products simply as \"sodium phosphates\" or \"potassium phosphates.\" However, if the processor chooses to use a more specific name, the phosphates can be declared by their accepted chemical names.

[http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 11 of 15 10/6/2005  
1:40 PM III. LABELING OF REACTION FLAVORS 1. Question: What are \"reaction flavors?\"

Answer: During the heating process, chemical reactions occur between reducing sugars and amino acids or proteins. This process conforms to what is commonly understood in chemistry to be the \"Maillard reaction.\" End products of Maillard reactions are referred to as Maillard reaction flavors, \"processed flavors,\" or as \"reaction flavors.\" 2. Question: What processing procedures must be used for reaction flavors? Answer: Presently, reaction flavor products must be processed by heating the reactant mixes at not less than 100\u00b0 C for not less than 15 minutes. 3. Question: Are reaction flavors \"flavoring?\" Answer: Yes. According to FDA\u2019s advisory opinion, the reaction mixture of free amino acid(s) (e.g., cysteine) and reducing sugar(s) (e.g., xylose) in a Maillard reaction system may be termed \"flavor,\" etc. 4. Question: If other substances are added to make a reaction flavor, when should the reactants in a reaction system be listed in the ingredients statement? Answer: The following label guidelines apply to ingredients that are part of a reaction system: a. All ingredients that are of animal origin must be identified by species and tissue, if appropriate, e.g., beef fat, chicken broth, gelatin, and must be listed in descending order of predominance. b. Complex carbohydrates, e.g., modified food starch and maltodextrin, must always be declared because they are not totally consumed (i.e., used up) under most reaction conditions. c. All non-animal proteinaceous substances, e.g., autolyzed yeast extract, hydrolyzed (source) protein, monosodium glutamate, soy sauce, whether totally consumed or not, must be declared. d. All ingredients that are of seafood origin, e.g., Bonito fish extract and shrimp must be listed. e. All ingredients that are foods, meat food products or poultry products, e.g., fruit or vegetable juice, cheddar cheese, beef extract or broth, pepperoni, and bacon must be declared by their standardized names. f. Thiamine hydrochloride, phosphates, salt, and vegetable oil must always be listed because they are not consumed in reaction process.", "Proprietary Mixture Suppliers and Manufacturers - FAQ's

[http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 12 of 15 10/6/2005  
1:40 PM --- g. Reducing sugar(s) and amino acid(s) that produce a flavor when treated with heat for at least 15 minutes at 100\u00b0 C may be grouped together and labeled as \"flavors.\" 5. Question: Is there a standard of composition or identity for reaction flavor? Answer: No, there is no standard of composition or identity for reaction flavor products; they are merely required to bear non-misleading descriptive names that comply with the established labeling guidelines.

6. Question: How would a reaction flavor be labeled? Answer: The Agency has established specific guidelines for labeling of reaction flavors. Example: a. If 40 percent water, 40 percent chicken meat, 10 percent hydrolyzed soy protein, 5 percent chicken broth, and 5 percent sugar were reacted with sufficient time and heat for a reaction to take place (100°C and 15 minutes), the product name would be Chicken Flavor (contains hydrolyzed soy protein and chicken broth). b. If 30 percent water, 30 percent beef extract, 20 percent xylose, 10 percent cysteine, 5 percent thiamine, and 5 percent salt were reacted with sufficient time and heat, the product would be labeled Beef Flavor (contains beef extract, thiamine, and salt). c. If a chicken "type" flavor was produced from a reaction without chicken as a substrate, using 40 percent water, 20 percent beef extract, 20 percent bacon fat, 10 percent dextrose, 5 pepperoni and 5 percent cysteine, the resulting product would be called Chicken Type Flavor (contains beef extract, bacon fat, and pepperoni). d. If the substrate is 90 percent chicken meat and 10 percent sugar, under the prescribed reaction conditions, the label would state "Chicken Meat and Chicken Flavor," unless it can be shown that the chicken meat is broken down in the reaction to yield only amino acids. In this case, the label would state "chicken flavor" or "flavor (contains chicken)." e. If the substrate is 50 percent pork trimmings, 30 percent xylose, 10 percent cysteine hydrochloride, 5 percent onion powder, 3 percent clove oil, and 2 percent rosemary extract, the label would state "pork flavor" or "flavor (contains pork)." 7.

Question: Are the labeling guidelines for reaction flavors intended to encompass ingredients with a separate identity as a meat food product or poultry product, e.g., dried beef plasma or pork stock? Answer: No. 8. Question: Can reaction flavors be labeled as "natural flavor?" Answer: No. The reaction mixture does not come from a natural source, as such, but is carefully formulated in specific proportions to ensure a product mixture of desired flavor characteristics.", "Proprietary Mixture Suppliers and Manufacturers - FAQ's

[http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 13 of 15 10/6/2005  
1:40 PM \u2022 9. Question: Do processors have to declare water as an ingredient in a reaction flavor? Answer: No. Water that is needed in order for the Maillard reaction to take place does not have to be declared. 10. Question: Can ingredients that are precluded by regulations from use in any meat or poultry product, e.g., sorbates, be used in the preparation of a reaction flavor? Answer: No. 11. Question: What is the appropriate labeling for a reaction mix that is not heat processed? Answer: The labeling guidelines for reaction flavors are not applicable to a mix of reactants (e.g., amino acids and reducing sugars) where heat has not been applied. Each ingredient, including amino acid(s) and reducing sugar(s), in the mix must be individually identified just as ingredients are listed in a seasoning or spice blend. [return to top of page] IV.

LABELING OF PROTEIN HYDROLYSATES 1. Question: Can protein hydrolysates be grouped in the ingredients statement, e.g., "hydrolyzed vegetable protein (corn, soy, wheat)"? Answer: No, "hydrolyzed vegetable protein" is not established by FDA as a common or usual name, nor is it established as an appropriate collective name for a variety of different protein hydrolysates. The common or usual name of a protein hydrolysate should be specific to the ingredient and shall include the identity of the source from which the protein was derived. Hydrolyzed soy protein, hydrolyzed corn gluten, and hydrolyzed casein are examples of acceptable names. The acceptable FDA designation is hydrolyzed corn protein, hydrolyzed soy protein, and hydrolyzed wheat protein. Question: What is the rule of thumb when the identity and function of a hydrolyzed substance is in question? Answer: According to FDA, appropriate standards exist to

allow a distinction between commercially available "highly" hydrolyzed protein hydrolysates and those variously termed "partially," "mildly," or "lightly" hydrolyzed that are not used for flavor-related purpose. According to the FDA, "highly" hydrolyzed proteins are declared as "hydrolyzed (source protein)", "Proprietary Mixture Suppliers and Manufacturers - FAQ's [http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC\\_QA.htm](http://www.fsis.usda.gov/OPPDE/larc/Ingredients/PMC_QA.htm) 14 of 15 10/6/2005 1:40 PM and can be defined as those whose ratio of alpha-amino nitrogen (AN) to total nitrogen (TN) is greater than 0.62 (AN:TN > 0.62). Proteins that are not highly hydrolyzed would have AN:TN of less than 0.62 (AN:TN < 0.62) and may be declared by using such terms as "partially," "mildly," or "lightly," e.g., "partially hydrolyzed (source protein)." When a problem arises regarding whether a hydrolyzed substance used in the formulation of a meat or poultry product is accurately identified and serving the primary function of flavoring, we consider these definitions and the level of use of the substance in question. In our experience, substances that have AN:TN > 0.62 would be used at less than 2 percent of the meat or poultry product formulation when used for the primary purpose of flavoring.

3. Question: What is the proper nomenclature of hydrolyzed protein derived from an animal source when utilized as an ingredient in meat or poultry products? Answer: The hydrolyzed protein of slaughtered animal species and tissue of origin, other than gelatin, must be indicated, e.g., "hydrolyzed beef plasma," "hydrolyzed pork stock," and "hydrolyzed pork skin."

4. Question: What are the acceptable declarations for protein hydrolysates that are made of blends of proteins, i.e., the proteins from different sources are hydrolyzed together or individually? Answer: According to FDA rules, for proteins that are blended prior to being hydrolyzed, an appropriate name for the hydrolyzed protein must be sufficiently descriptive of the product and must include all of the various proteins that were used to make the hydrolyzed protein. For example, a hydrolyzed protein made from a blend of corn protein, soy, protein, and wheat gluten would be "hydrolyzed corn, soy, and wheat gluten protein." If proteins are hydrolyzed individually prior to blending, then the common or usual name of each protein hydrolysate must be indicated, e.g., "hydrolyzed corn protein, hydrolyzed soy protein, and hydrolyzed wheat gluten."

5. Question: Is "hydrolyzed gelatin" an acceptable common or usual name? Answer: No. According to a FDA decision, "hydrolyzed gelatin" falls within the standard for Type B gelatin and, therefore, would be declared as "gelatin." [return to top of page]

oli\_Testing\_Cattle\_Swine\_Estab.pdf", "type": "pdf", "n\_pages": 22, "word\_count": 7444, "text\_by\_page": [{"Guidelines for Escherichia coli Testing for Process Control Verification in Cattle and Swine Slaughter Establishments INTRODUCTION Under the Pathogen Reduction\HACCP Regulation, slaughter establishments are required to test carcasses for generic E. coli as a means of verifying process control. This document outlines sampling and microbial testing procedures that would meet this requirement. These guidelines may be helpful to your company microbiologist or analytic laboratory. This document is a supplement to the Regulation but not a substitute; in-depth details of microbial sampling and testing may be found in the Regulation. Background These guidelines describe a nondestructive sponge technique for sample collection from raw cattle and swine carcasses. The Pathogen Reduction\HACCP Regulation anticipated that this nondestructive technique would be used with samples taken from the same point in the slaughter process as were the samples in the FSIS Nationwide Microbiological Baseline Data Collection Programs. It was envisioned that a conversion factor would correlate sample results from the sponge method to results from the excised-tissue method used in the baseline studies. Performance criteria derived from the baseline studies - with acceptable, marginal, and unacceptable ranges - would then be applied to establishment sample results obtained by the sponging method. Analysis of recent data, however, has not been able to determine such a conversion factor for the two methods. For this reason, the regulatory criteria described in the Regulation remain relevant only to excised-sample results, upon which they were based. Consequently, the Agency is requiring that establishments test for generic E. coli and employ standard statistical process control measures to demonstrate that their operations are in control, until such time as new baselines are established with the sponging method. Also provided here in an Addendum are the sampling and analytical techniques, using excised tissues, that were employed in the FSIS baseline studies; establishments may use the excised-tissue technique and apply the performance criteria originally defined for their specific operations. Statistical Process Control - An Overview The statistical process control approach required by the Agency is based on the principle that every product is produced by a process. All processes are subject to variation, which should be", "understood and controlled by statistical methods. A process that is in control is stable in terms of average level and degree of variation, i.e., it is predictable within limits and is thus \"doing its best.\\" Processes that have not been subjected to analysis are not likely to be in control. Control is attained, often by degrees, by detecting and eliminating special causes of variation, those not present all the time or not affecting all product output. This involves initially evaluating data to determine process capability (the typical process performance level), and then checking subsequent data to see if they are consistent with this baseline level, i.e., the process is in control and variations are within normal and acceptable limits. This is accomplished by checking for unreasonably high results, trends, etc., and looking for and correcting problems in the process when these signals occur. It is important to recognize that an in-control process may not necessarily result in product of the desired quality improvements may be needed or the entire process may require reconsideration. Problems in a process may stem from many sources, for example: inadequate knowledge of how a process should work or how a specific process is performing; errors or deficiencies in executing procedures; failure to recognize the need for preventive measures; unnecessary complexity in the process; and uncontrolled variation among inputs. Specific techniques of statistical process control include

the time plot, which charts measurements over time; this is the first technique to use with data collected over time and analyzed for patterns. A further development is the control chart, which plots data over time but also displays an upper control limit for specific measurements, and a centerline, above and below which there is an equal number of sample results (the centerline is in effect a median average). A sample result above the upper control limit would indicate the likely presence of a special cause of variation that should be addressed. Results within control limits indicate simply that the process is in control. Control charts have two essential uses: after-the-fact analysis of process performance and gaining and maintaining control of a process. In most situations more than one type of control chart would be applicable; detailed information can be found in texts on statistical quality control, under the topic "control charts." In general, statistical process control techniques help to provide experience in "process thinking" (a central tenet of HACCP), develop an historical record of performance, evaluate the long-term stability of a process and determine process capability (i.e., how it is actually working), and judge the effectiveness of process improvement actions.

Generic E. coli testing conducted as part of statistical process control will not be directly useful for attaining and maintaining control of a process, as test results will come from the end of the process and in any case would not be timely enough; observations made earlier in the process would be more useful for attaining and maintaining control. Rather, E. coli testing would serve to verify process control. Process control techniques, applied and verified in this manner, would accomplish the essential intent", "of the Regulation by integrating process control and microbial testing into slaughter operations.

**GUIDELINES FOR SAMPLE COLLECTORS\ MICROBIOLOGISTS**

Pre-sampling Preparation Sample collection shall be conducted by the individual(s) designated in the establishment's written procedures for microbiological sampling, as required by 9 Code of Federal Regulations (CFR) Part 310.25(a)(2)(i). These procedures shall also specify the location of sampling, the random sample selection method chosen by the establishment, and sample handling procedures that will ensure sample integrity. Before beginning sample collection, assemble sampling supplies, such as sterile gloves, sterile sampling solutions, hand soap, and sanitizing solution, as well as specific materials needed for sampling different carcass types (i.e., specimen sponges in bags and template for sampling cattle or swine carcasses). For cattle and swine carcass sampling, a template is recommended to mark off the area to sample. The template can be made of any suitable material, such as metal or aluminum foil, brown paper, or flexible plastic. Some disposable templates may be sterilized and individually prepackaged. To make a reusable template, cut out a 10 centimeters (cm) x 10 cm (3.94 inches x 3.94 inches) square from a sheet larger than the area to be sampled. (See Figure 1). If a reusable template is used, it will need to be sanitized with an approved sanitizing solution [e.g., hypochlorite (bleach) solution or alcohol]; however, the template needs to be dry before it is placed on the carcass. Aluminum foil or paper templates can be used once and discarded; foil or paper used for the template should be stored so as to prevent contamination. Since the area enclosed by the template will be sampled, take care not to touch this area with anything other than the sampling sponge. Using dirty or contaminated material may lead to nonrepresentative results. If an autoclave is available, paper or aluminum foil templates can be wrapped in autoclavable paper and sterilized. Sterile sampling solutions, such as Butterfield's phosphate diluent (BPD) or buffered peptone water (BPW), can be stored at room temperature; however, at least the day before sample collection, check such solutions for cloudiness and do not use

solutions that are cloudy or turbid or that contain particulate matter. Place the number of containers of sampling solution that will be needed for the next day's sampling in the refrigerator. To obtain the most accurate results, samples should be analyzed as soon after collection as possible. If samples must be transported to an off-site laboratory, they should be refrigerated and then shipped refrigerated, on the same day they were collected, via an overnight delivery service to the laboratory. A sample should arrive at the laboratory and be analyzed no later than the day after it is collected. If sample collection, pick-up or shipment, and laboratory analysis cannot be carried out within this timeframe, the carcass selected for sampling", "should be held until the process can be accomplished in the appropriate span of time. The same principle applies for samples that are analyzed in-plant: If a carcass cannot be sampled and the sample analyzed by the day after it is taken, the carcass should be held until this is possible. A collected sample should not be held; it should be either analyzed in-plant by the next day or immediately shipped for overnight delivery to the laboratory that will conduct the analysis. The Sample Shipment section below gives information on shipping containers and transporting samples to off-site facilities. Sampling frequency Sampling frequency for E. coli testing is determined by production volume. The required minimum testing frequencies for all but very low production volume establishments are shown in Table 1 by type of livestock. An establishment need sample only the predominant species when two or more species are slaughtered. Table 1. E. coli Testing Frequencies Cattle 1 test per 300 carcasses, or at least 1 test per week Swine 1 test per 1,000 carcasses, or at least 1 test per week NOTE: These testing frequencies do not apply to very low volume establishments. See Table 2. Very low volume establishments Some establishments may be classified as very low volume establishments. The maximum yearly slaughter volumes for very low volume establishments are described in Table 2. An establishment need sample only the predominant species when two or more species are slaughtered. Table 2. Maximum Yearly Livestock Slaughter Volumes for Very Low Volume Establishments Type of Criteria (Yearly Slaughter Volume) Livestock Cattle not more than 6,000 head Swine not more than 20,000 head Cattle and not more than 20,000 total, with not more Swine than 6,000 cattle A very low volume establishment will sample the predominant species once per week beginning the first full week of operation after June 1, until at least 13 test results have been obtained or the following June 1, whichever", "is first. The establishment will repeat the same sampling regime once per year, beginning the first full week of operation after June 1. If a very low volume establishment is using the excised-sample technique and is slaughtering a type of livestock for which performance criteria have been determined, the establishment must continue sampling once per week until results show that it has met the m\l/M criteria outlined in the Pathogen Reduction\HACCP Regulation. See Addendum below. Random selection of carcasses Samples are to be taken randomly at the required frequency. For example, given that the frequency of testing for cattle is one test per 300 cattle slaughtered, if a plant slaughters 150 head of cattle an hour, one sample will be taken every two hours. Note: If more than one shift is operating at the plant, the sample can be taken on any shift. Cattle and swine carcass selection Different methods of selecting the specific carcass for sampling could be used, but all require the use of random numbers. Examples of methods include random number tables, calculator- or computer-generated random numbers, or drawing cards. The carcass for sampling should be selected at random from all eligible carcasses of the predominant species. If there are multiple lines or chillers, randomly select the line or

chiller for sample collection for that interval; each line or chiller should have an equal chance of being selected at each sampling interval. Both the \"leading\" and \"trailing\" sides of a carcass should have an equal chance of being selected within the relevant time frame (based on the sampling frequency for the plant). Cattle and swine carcasses may be designated for sampling at any time, but samples should be collected at the end of the slaughter process after chilling for at least 12 hours; hide-on or hotboned swine or cattle samples should be collected after the final wash. Aseptic techniques\sampling Extraneous organisms from the environment, hands, clothing, sample containers, sampling devices, etc., may contaminate samples and lead to non-representative analytical results. It is necessary to use aseptic sampling techniques and clean, sanitized equipment and supplies. An area should be designated for preparing sampling supplies. A stainless steel, wheeled cart or table would be useful during sampling. A small tote or caddy could be moved to the location of sampling and used for carrying supplies; sample bags could be placed on the tote or caddy when sterile solutions are added to the bags. Sterile gloves should be used for collecting samples. Nothing should contact the external surface of the glove except the exposed sample being collected or the sterile sample utensil (specimen sponge). Keep in mind", "that the outside surfaces of the sample container are not sterile. The following procedure for putting on sterile gloves can be followed when collecting samples: a) Peel open the package of sterile gloves from the top without contaminating (touching, breathing on, contacting) the exterior of the gloves. b) Remove a glove by holding it by the inner surface of the wrist-side opening. Avoid any contact with the outer surface of the glove. Insert the washed and sanitized hand into the glove, taking care not to puncture the glove. c) Taking care not to contaminate the exterior surface of the glove, repeat the above step for the hand you will use to physically handle the sample. d) If at any time you are concerned that a glove may be contaminated, begin again with step a) above.

Preparation for Sample Collection

On the day of sampling, gather all sample collection bags, sterile gloves, sanitizer, hand soap, sterile solutions for sampling, and specific materials needed. Ensure that all sampling supplies are on hand and readily available before beginning sample collection. Label the sample bags before starting the sampling procedure. Use permanent ink. If you are using paper labels, it is important that the label be applied to the bag at normal room temperature; it will not stick to the sample bag if applied in the cooler. Outer clothing such as frocks, gloves, or head gear worn in other areas of the plant should be removed before entering the sampling area or preparing to collect samples. Replace outer clothing with clean garments, such as a laboratory coat, that have not been directly exposed to areas of the plant outside of the sampling area. Sanitize the sample work area surfaces by wiping with a clean disposable cloth or paper towel dipped in a freshly prepared 500 ppm (parts per-million) sodium hypochlorite solution (0.05% sodium hypochlorite) or other approved sanitizer that provides an equivalent available chlorine concentration. The sample work area surfaces must be free of standing liquid before sample supplies or product containers are placed on them. Before sampling, thoroughly wash and scrub hands to the midforearm. Use antibacterial hand soap. This procedure should include a sanitizer at 50 ppm equivalence available chlorine, if available. Dry the hands using disposable paper towels.", "Cattle and Swine Surface Sponge Sample Collection Procedure Materials: 1. Sterile specimen sponge in sterile Whirl-Pak\u00ae-type bag or equivalent[approximately 1 1/2\" x 3\" x 5/8\" after hydration) 2. 25 ml sterile sampling solution (e.g., Butterfield's phosphate diluent [BPD] or sterile buffered peptone water [BPW]) 3. Sterile ziplock-type or

stomacher bag 4. Template for 100 CM<sup>2</sup>sampling area 5. Sterile gloves 6. Sanitizing solution 7. Small tote or caddy for carrying supplies 8. Wheeled ladder, platform, or step ladder Collection A sterile (non-latex, non-bactericidal) sampling sponge, which is usually dehydrated and prepackaged in a sterile bag, will be used to sample all sites on the carcass. The sites are for cattle: flank, brisket, and rump see Figure 2 (for hide-on calves: inside the flank, inside the brisket, and inside the rump); for swine: belly, ham, and jowl - see Figure 3. It is important to sponge the areas in the order of least to most heavily contaminated in order to avoid spreading any contamination. Therefore, sponge the areas in the sequence indicated in this sampling protocol. Nondestructive surface sampling should be conducted as follows: 1. Ensure that all supplies are on hand, including the sampling template, and that all bags have been pre-labeled. The information needed for each sample includes the type of livestock sampled, the date and time of sample collection, and, if there is more than one slaughter line, the slaughter line from which the sample was collected. (An assistant may be helpful during the sampling process.) 2. If a reusable template is used, immerse the sampling template in an approved sanitizing solution for at least 1-2 minutes. Just before sponging the first sample site on the carcass, retrieve the sampling template from the sanitizing solution (step 12). Shake excess solution from the template and let dry, then protect the portion of the template that will contact the carcass from contamination. 3. For cattle: Locate the flank, brisket, and rump sampling sites using illustrations and directions in Figure 2 (cattle carcass sampling locations).,"For swine: Locate the belly, ham, and jowl sampling sites using illustrations and directions in Figure 3 (swine carcass sampling locations). 4. While holding the sponge bag at the top corner by the wire closure, tear off the clear, perforated strip at the top of the bag. Open the bag. 5. Remove the cap from the sterile BPD\BPW bottle, being careful not to touch the bottle opening. Do not contaminate the lid. 6. Carefully pour the entire contents of the sterile BPD\BPW bottle (25ml) into the sponge bag to moisten the sponge. 7. Close the top of the bag by pressing the wire closures together. Use hand pressure from the outside of the bag and carefully massage the sponge until it is fully hydrated (moistened). 8. With the bag still closed, carefully push the moistened sponge to the upper portion of the bag, orienting one narrow end of the sponge up toward the opening of the bag. Do not open the bag or touch the sponge with your fingers. Hold the bag and gently squeeze excess fluid from the sponge using hand pressure from the outside. The whole-moistened sponge should still be in the upper portion of the bag, with the excess BPD\BPW in the lower portion. 9. Open the bag containing the sponge, being careful not to touch the inner surface of the bag with your fingers. The wire closure at the top of the bag should keep the bag open. Set bag aside. 10. Put on a pair of sterile gloves (use procedure on pp. 6-7). 11. Carefully remove the moistened sponge from the bag with the thumb and fingers (index and middle) of your sampling hand. 12. With the other hand, retrieve the template by the outer edge, taking care not to contaminate the inner edges of the sampling area of the template. 13. For cattle: Locate the flank sampling area (Figure 2). Place the template over this location. For swine: Locate the belly sampling area (Figure 3). Place the template over this location. 14. Hold the template in place with one gloved hand (Remember, only the sponge should touch the sampling area. Take care not to contaminate this area with your hands.) 15. With the other hand, wipe the sponge over the enclosed sampling area (10 cm x 10 cm) for a total of approximately 10 times in the vertical and 10 times in the horizontal directions. The pressure for sponging would be as if you were removing dried blood from the

carcass;","however, the pressure should not be so great as to crumble or destroy the sponge. (Note: The template may need to be \"rolled\" from side to side during sponging since the surface of the carcass is not flat. This ensures that the 100 cm<sup>2</sup> area is enclosed while sponging.) 16. For cattle: Repeat steps 14-15 for the brisket area, using the same side of the sponge used for the flank. Then, repeat steps 14-15 for the rump area, using the side of the sponge opposite that used for the flank and brisket. For swine: Repeat steps 14-15 for the ham area, using the same side of the sponge used for the belly. Then, repeat steps 14-15 for the jowl, using the side of the sponge opposite that used to sponge the belly and ham. 17. For cattle: After sponging the brisket and rump areas, carefully place the sponge back in the sponge sample bag, taking care not to touch the sponge to the outside of the sample bag. For swine: After sponging the ham and jowl areas, carefully place the sponge back into the sponge bag. Do not touch the surface of the sponge to the outside of the sponge bag. 18. Press wire closures of the sponge bag together, expel excess air, then fold down the top edge of the bag 3 or 4 times. Secure the bag by folding the attached wire tie back against the bag. Place the closed sponge bag into the second bag and close the second bag securely. 19. a) If samples are to be analyzed at an on-site laboratory, begin sample preparation (Analytical Methods section) b) If samples are to be analyzed at an outside (off-site) laboratory, follow procedure in the Sample Shipment section. Sample Shipment If on-site facilities are not available, samples should be shipped to an outside laboratory the same day they are collected. Samples should be analyzed no later than the day after collection. Shipping containers and coolant packs It is important that samples fit easily into the shipping containers so that the sample bags do not break. Correct use of coolant gel-ice packs and proper packing of the shipping container are necessary so that samples arrive at the laboratory at an acceptable temperature (0-10\u00b0C). Maintaining samples at improper temperatures may cause inaccurate results. The sample should be kept refrigerated, not frozen, in the shipping container before it is picked up. The shipping container itself should not be used as a refrigerator; however, multiple samples (if needed) for that","day may be stored in the open shipping container in the cooler or refrigerator. Recommended Procedure 1. Prechill shipping container by placing the open shipping container in the refrigerator at least the day before sampling. 2. Place the appropriately-labeled, double-bagged sample(s) in the prechilled shipping container in an upright position to prevent spillage. Newspaper may be used for cushioning the sample and holding it in the upright position. If more than one sample is collected during the day, take steps to ensure that samples are maintained at refrigeration temperature, as this helps limit multiplication of microorganisms. 3. Place a corrugated cardboard pad on top of sample(s). This corrugated cardboard pad prevents direct contact of frozen gel packs with the samples. Next place the frozen gel pack(s) on top of the corrugated pad. Use sufficient frozen coolant to keep the sample refrigerated (0-10\u00b0C) during shipment to the designated laboratory. Insert foam plug and press it down to minimize shipper head space. 4. Ship samples to the laboratory via overnight delivery or courier. Suggested Criteria for Microbiological Laboratories These suggestions are not meant to be exhaustive. Specific needs will vary from one processor to another. Personnel Both laboratory analysts and supervisors must have education, training, and experience in food microbiology. Specific familiarity with meat slaughter operations would be desirable. Personnel should be well versed in methods of analysis for meat samples and the organisms associated with meat products. Facilities Laboratory facilities should be suitable for conducting routine and specialized

microbiological analyses and should provide adequate bio-safety precautions. It is crucial that the laboratory maintain separate, defined areas for sample receipt, preparation, and analytic work. Equipment The laboratory should have suitable equipment, appropriate preventive maintenance programs, readily available equipment manuals, and log books for documentation. Specialized equipment may be necessary for some applications.", "Operations The laboratory should have in place a written quality assurance (QA) program that is available to all employees. The QA program should include bio-safety equipment, media preparation, microbiological methods and procedures, control programs, equipment control, culture maintenance, sample receipt, handling, result reporting, and record keeping. Records Records should contain a complete sample description, including condition, source, lot code, date, quantity, etc. Results should be reported promptly and all data and summaries permanently recorded with the results. Analytical Methods All sample analyses must begin the day after collection. Samples must be analyzed using one of the E. coli (Biotype I) quantitation methods found in the Official Methods of AOAC International, 1611 edition, 3rd revision, 1997. Or, by any method that is validated by a scientific body in collaborative trials against the 3-tube Most Probable Number (MPN) method and that agrees with the 95% upper and lower confidence limits of the appropriate MPN index. The following methods for generic E. coli quantitation in foods have been AOAC-approved: 1) 3-tube MPN method - AOAC 17.2.01-17.2.02 2) Modified 3-tube MPN method - AOAC 17.3.07 - Substrate Supporting Disc Method (ColiComplete\u00ae). ColiComplete\u00ae Substrate Supporting Discs are available from BioControl Systems, Inc., 19805 North Creek Parkway, Bothell WA 98011. 3) Modified 3-tube MPN method - AOAC 17.4-01 - Fluorogenic Assay for Glucuronidase. Lauryl sulfate tryptose broth with added 4-methylumbelliferyl-B-D-glucuronide (MUG) is used in a 3-tube MPN method. 4) Plating Method - AOAC 17.3.04 - Dry Rehydratable Film (Petrifilm E. coli Count Plate) Method. Medical-Surgical Division\3M, 275-5W 3M Center, St. Paul MN 55144. 5) Filtration\Plating Method - AOAC 17.3.09 - Hydrophobic Grid Membrane Filter\MUG (ISO-GRID) Method. QA Life Sciences, Inc., 6645 Nancy Ridge Dr., San Diego CA 92121. Note: For most quantitative assays, weekend laboratory work can be kept to a minimum by refrigeration of incubated plates\tubes until Monday. A programmable refrigerated incubator is useful in such cases. For commercially available methods follow manufacturer's recommendations.", "Suggested quantitation schemes If a generic 1 milliliter (ml) plating technique is used for E. coli quantitation for cattle or swine carcass sponge sample analysis, the average plate count (if 2 plates are used) or the single plate count (if 1 plate is used) would be divided by 12 to equal the count of colony forming units per cm<sup>2</sup>. Record this value even if it is less than 1 cfu\cm. For cattle samples the undiluted sample extract (10\u00b0) and a 1:10 dilution should be plated, preferably in duplicate. For swine samples the undiluted sample extract (10\u00b0), a 1:10, a 1:100, and a 1:1, 000 dilution should be plated, preferably in duplicate. Higher or lower dilutions may need to be plated based on the specific product. If a hydrophobic grid membrane filtration method is used, the only difference would be filtration of 1 ml of the undiluted sample extract (10\u00b0) and 1:10 dilution for cattle samples and 1 ml of the 10\u00b0 - 103 dilutions for swine samples. Additional dilutions of the original extract may need to be used if a 3-tube MPN protocol is used. The 3 highest dilutions that were positive for E. coli are used to calculate the MPN. MPN values from the appropriate MPN Table represent the count per ml of original extract and therefore must be divided by 12 to obtain the count per cm<sup>2</sup> of carcass surface area. Record

this value even if it is less than 1 cfu/cm<sup>2</sup>. Recordkeeping Each test result must be recorded in terms of colony forming units per square centimeter (cfu/cm<sup>2</sup>). Record this value even if it is less than 1 cfu/cm<sup>2</sup>. A process control table or chart can be used to record the results and facilitate evaluation. Results should be recorded in the order of sample collection and include information useful for determining appropriate corrective actions when problems occur. The information needed for each sample includes date and time of sample collection, and, if more than one slaughter line exists, the slaughter line from which the sample was collected. These records are to be maintained at the establishment for 12 months and must be made available to Inspection Program employees on request. For E. coli testing to be most useful for verifying process control, timeliness is important and the record should be updated with the receipt of each new result. Records should also be kept of any corrective actions taken if process control deviations are detected through microbiological testing. Note: Occasionally, samples shipped to off-site laboratories may be lost during shipping or may arrive at the laboratory late or outside the acceptable temperature parameters for sample analysis (0-10@C). Any reasons for missing data should be documented.", "Figure 1. Example of sampling template (not drawn to scale) 15 10 cm 10 cm", "Figure 2. Sampling locations for E. coli testing of cattle carcasses Rump Locate the posterior aspect of the aitch bone. Draw an imaginary line toward the achilles tendon. At the point where the line intersects the cut surface of the round is the starting point for the rump sample. Measure 10 cm up the line leading to the achilles tendon, then 10 cm over (laterally), then 10 cm back to the cut surface of the round, then 10 cm along the cut surface to form the 10 cm by 10 cm square area. Note: The upper illustration has been purposely altered somewhat. A true lateral view of the carcass would not show the aitch bone. From a medial view, the whole 10 cm x 10 cm sampling area could not be seen. Therefore, a lateral view with a portion of the round removed so the location of the aitch bone is shown is illustrated. Flank Locate the cutaneous flank muscle (external abdominal oblique) and follow the medial border of the muscle anteriorly until it comes within approximately 3\'' of the midline. This will be the starting point. Measure up (posteriorly) 10 cm (approximately 4 inches) along a line approximately 3\'' from the midline (measure up or parallel to the midline), then over (laterally) 10 cm (approx. 4 inches) to form a 10 cm wide by 10 cm long square sample. Brisket Locate the elbow of the carcass. Draw an imaginary line straight across (medially) to the midline cut. This will be the starting point. Measure up along the midline 10 cm (approximately 4 inches), then over 10 cm (approximately 4 inches) to form a 10 cm wide by 10 cm long square sample.", "Figure 3. Sampling location for E. coli testing on swine, carcasses belly Locate the elbow of the carcass. Draw an imaginary line straight across (medially) to the midline cut. This will be the starting point. Measure up along the midline 10 cm (approximately 4 inches), then over 10 cm (approximately 4 inches) to complete the 10 cm long by 10 cm wide square sample. This square area will be the 100 cm<sup>2</sup> area to swab for the belly sample. Jowls Draw an imaginary line from the atlas/axis joint to the ventral midline; all skin below that point will be considered the jowl. Ham From the dorsal position, locate the lateral surface of the base of the tail and measure up caudal) 5 cm along the lateral edge of the exposed fat margin, then 10 cm laterally. Now measure 10 cm down cranial), then 10 cm medially, then 5 cm up (posteriorly) to complete a 10 cm long by 6 cm wide rectangular sampling area. 17", "ADDENDUM EXCISION SAMPLE COLLECTION AND ANALYSIS TECHNIQUES USED IN THE FSIS NATIONAL BASELINE STUDIES PREPARATION 1. Label 3 sample bags with the labels provided: for cattle brisket, flank,

and rump; for swine - jowls, belly, and ham). It is important that the labels be applied to the bags at normal room temperature; they will not stick if applied in the cooler. 2. Measure the length of the blade on the knife you will be using for sample collection. You can use this measurement to estimate the size of the 10 inch long by 5 inch wide ham and belly samples for swine, and the 8 inch long by 6 inch wide samples for cattle. 3. Assemble the following: labeled bags knife (cleaned and sanitized) hook (or hemostat-type forceps), cleaned several packages containing sterile surgical gloves clean container (volume of 1 gallon or greater) FSIS-approved household bleach product potable water Also, locate a wheeled ladder, sampling platform, or step ladder that can be used to help you safely reach the ham or rump of the carcass. You will need at least one assistant to hold the sample bag and help you in other ways. 4. Prepare the chemical sanitizing solution by adding 2 to 4 oz. bleach to 1 gallon (128 oz.) potable water in the container (this will give a strength of 1000-2000 ppm hypochlorite, which is strong enough to sanitize properly even in the presence of some organic matter). Note: prepare fresh bleach solution immediately before going into the cooler for sampling; its strength diminishes upon standing.

**SAMPLE COLLECTION**

1. Have your assistant immerse the entire sampling tool (including the handle) in the bleach solution for 1-2 minutes. Have your assistant put on a pair of sterile gloves (taking care not to touch the sterile outer surface of the glove with fingers) before carefully retrieving the sampling tools from the bleach solution. Shake excess solution from utensils, and then protect the sampling ends of the tools from contamination. Do not put the sanitized sampling implements into your scabbard (it has not been sanitized).
2. Put on one sterile glove at a time, taking care not to touch the sterile outer surface of the glove with your fingers. Having both hands gloved will remind you that you need to follow "aseptic" procedures. Remember: Touch nothing with your gloved hands except the sanitized instruments or the carcass if necessary.
3. Locate the 3 carcass sampling sites. (Note: Remember you can use the knife blade to estimate the length of samples.)
4. For cattle: Use the knife to mark out the sample borders of the brisket sample from one side of the carcass. You do not need to cut very deep since only the skin surface is needed; a 1/2 inch thick sample is sufficient. It is very important that the sample be 8 inches long by 6 inches wide (not 6 1/2 long and 8 1/2 wide) and that it be in one piece. Carefully excise the sample using the knife and the sanitized hook or forceps. Roll or fold the sample so that it fits easily into the sample bag (do not cut the sample into strips). Have your assistant hold open the labeled sample bag, and place the brisket sample inside the bag without touching the outside of the sample bag or the assistant. Have assistant close the sample bag.
- For swine: You will be collecting the surface (skin) of both jowls. A 1/2 inch thickness is sufficient; you do not need to cut very deep since only the skin is being sampled. It is very important that you collect all the skin from both jowls; the laboratory analysis requires that each of the two jowl samples provide a surface area equivalent to a 5 inch by 5 inch square. Surface area in excess of this is acceptable, as the laboratory will trim it down. The skin on each jowl should be carefully removed in one piece using the knife and the sanitized hook or forceps. Roll or fold the samples so that they fit easily into the sample bag (do not cut the samples into strips). Have your assistant hold open the labeled sample bag, and place the two jowl samples inside the bag without touching the outside of the sample bag or the assistant. Have assistant close the sample bag.
5. Do not put the sampling implements back into your scabbard. You may wish to "sheathe" your knife in the carcass where you will be able to reach it from the ladder or platform (insert it

perpendicular to the floor, perhaps into the teat line or the medial flank). 6. For cattle: Remove the knife from the carcass and mark out the sample borders for the flank sample. Collect the 8 inch long by 6 inch wide by 4 inch thick skin sample and place it in the appropriately labeled bag. For swine: Use the knife to mark out the sample borders of the belly sample from one side of the carcass. You will be excising only the skin from an 10 inch long by 5 inch wide sample. You do not need to cut very deep since only the skin surface is needed; a 1/8 inch thick sample is sufficient. 'It is very important that the sample be 10 inches long by 5 inches wide (not 5" long and 10" wide) and that it be in one piece. Carefully excise the sample using the knife and the sanitized hook or forceps. Roll or fold the sample so that it fits", "easily into the sample bag (do not cut the sample into strips), and place the sample in the bag. 7. Do not put the sampling implements back into your scabbard. You may wish to "sheathe" your knife in the carcass where you will be able to reach it from the ladder or platform (insert it perpendicular to the floor, perhaps into the teat line or the medial flank). 8. Remove your gloves and climb the ladder or platform, holding onto the hand-rail. Once at a convenient and safe height for sampling the ham or rump, carefully put on a new pair of sterile gloves. 9. For cattle: Remove the knife from the carcass and mark out the sample borders for the rump sample. Collect the 8 inch long by 6 inch wide by 4 inch thick skin sample and place it in the appropriately labeled bag. Knives and sampling implements may now be put into your scabbard as sampling has been completed. For swine: Remove the knife from the carcass and mark out the sample borders for the ham sample. Collect the 10 inch long by 5 inch wide by 1/2 inch thick skin sample and place it in the appropriately labeled bag. Knives and sampling implements may now be put into your scabbard as sampling has been completed. 10. In the event that a sample is dropped, discard that sample. Go to the companion carcass side and sample the area corresponding to the dropped sample. If gloves and\or instruments have touched-any surface other than the carcass or the sanitized instruments, gloves will need to be changed and\or instruments sanitized. SAMPLE SHIPMENT Shipping containers (temperature-controlled container or similar container), gel-ice packs (specifically designed for shipment of refrigerated samples), and cardboard spacers should be specified by the designated receiving laboratory. If samples are too large to fit into a single shipping container, use 2 shipping containers (make a duplicate of the data sheet and include a notation that you have used 2 shippers). Pre-chill shipping container properly. Address shipping container to the designated laboratory. Samples are to be shipped refrigerated. 1. Freeze gel-ice packs according to label instructions (0°F for 24 hours). Shipping box may be pre-chilled in the cooler if space permits. 2. Place samples into the shipping container as indicated in its instructions. If more space is needed, use another shipping container; do not force too much material into too small a space. 3. Check the sample data sheet for the designated receiving laboratory, and select the appropriate delivery service label. Be sure to enclose", "the sample data sheet in a separate plastic bag and put it into the shipper with the samples. 4. Close and seal shipping container according to printed instructions on the carton. Apply the preprinted address label to the shipping box and ship immediately via the designated overnight-express delivery service so that the samples arrive chilled at the laboratory. FSIS PROCEDURES FOR THE ENUMERATION OF GENERIC E. COLI 1. Sample Preparation A. In order for the samples to be valid and to maintain consistency, analyses must begin the day following sample collection. Samples must meet temperature criteria (0-10°C) in order to be considered for analysis. B. Three refrigerated subsamples,

representing one sampled carcass, will be received by the laboratory. Sample condition and temperature upon receipt should be documented on each sample, together with the date of receipt. Only those samples received at = 0.0°C and 10.0°C will be analyzed.

1. Using a sterile trier (e.g. a circular trier with a 3.6 cm diameter, yielding approximately 10 cm<sup>2</sup>/surface area), randomly cut 2 intact tissue discs from each subsample (flank, rump, and brisket for cattle; belly, ham, and jowls for swine). (Optional: Remaining subsample tissue may be retained under refrigeration in the event the analysis needs to be repeated.)

2. If the thickness of a disc greatly exceeds 1/8 inch, take a sterile scalpel and forceps and aseptically remove fat from the bottom of the plug so disc is approximately 1/8 inch thick. (Bacterial contamination should be limited to the outer, skin, surface of the disc, so excess tissue must be trimmed from the bottom surface.)

3. Label a sterile Stomacher 3500 bag so that it corresponds to the label on the original subsample bag. Aseptically place the 2 tissue discs from each single subsample into the sterile Stomacher 3500 bag.

C. Begin quantitative analyses for E. coli (biotype I) on the day of sample receipt. Using aseptic techniques, remove 2 tissue discs from each of the three subsample stomach bags and place these 6 discs into the labelled Stomacher 3500 bag.

"II. Analytical Methods

A. Preparation of sample homogenate for generic E. coli

1. Select the labelled Stomacher 3500 bag containing a composite of 6 discs that was prepared as described in Section IC (above).

2. Add 600 ml Butterfield's Phosphate Diluent (BPD) or buffered peptone water (BPW) to the core samples (this should approximate a 1:10 s.a./v. (surface area/volume) ratio).

3. Stomach for 2 minutes, prepare serial dilutions of 10-2 to 10-6, and then proceed according to Instructions IIB (below).

B. Quantitative Test for generic E. coli

1. Samples must be analyzed using one of the generic E. coli quantitation methods found in the Official Methods of AOAC International, 16<sup>th</sup> edition, 3rd revision, 1997, or by any method that is validated by a scientific body in collaborative trials against the 3-tube Most Probable Number (MPN) method and that agrees with the 95% upper and lower confidence limits of the appropriate MPN index.

2. The excised sample is considered negative for generic E. coli when no E. coli colonies are present on plates of the lowest dilution (10-1). If E. coli colonies are present, multiply the average plate count by the appropriate dilution factor and record E. coli results as cfu/cm<sup>2</sup>.

APPLYING PERFORMANCE CRITERIA TO EXCISED-SAMPLE TEST RESULTS

E. coli excised-sample results for cattle and swine tested in the FSIS baseline studies have been separated into three categories for the purpose of process control verification: acceptable, marginal, and unacceptable. In the Pathogen Reduction/HACCP Regulation, m and M, representing respectively the 80th and 98th percentile of sample results, leaving 18 percent of results in the marginal range denoted the upper limits for the acceptable and marginal ranges.

"Table 3. Values for Marginal and Unacceptable Results for E. coli performance criteria Slaughter Acceptable Range Marginal Range Unacceptable Range Class

Cattle \*negative positive above 100 but not above 100 cfu/cm<sup>2</sup> cfu/cm<sup>2</sup> Swine 10 cfu/cm<sup>2</sup> above 10 cfu/cm<sup>2</sup> above 10,000 but not above 10,000 cfu/cm<sup>2</sup> cfu/cm<sup>2</sup> \*

An excised sample is considered negative when no E. coli colonies are present on plate(s) Of the lowest dilution (10-1). If E. coli colonies are present, multiply the average plate count by the appropriate dilution factor and record the result as cfu/cm<sup>2</sup>. To illustrate the use of Table 3, consider a cattle slaughter establishment. E. coli test results for this establishment will be acceptable if negative, marginal if positive but not above 100 cfu/cm<sup>2</sup> (>m but =M), and unacceptable if above 100 cfu/cm<sup>2</sup> (>M). Verification Criteria The verification criteria should be applied to test

results in the order that samples are collected. The criteria consist of limits on occurrences of marginal and unacceptable results. As each new test result is obtained, the verification criteria are applied anew to evaluate the status of process control with respect to fecal contamination. This way of looking at the number of marginal and unacceptable results is described as a \"moving window\" approach in the regulation. With this approach, results are accumulated until 13 have been accrued. After this, only the most recent 13 results - those in the \"moving window\" are considered. 1. An unacceptable result should trigger action to review process controls, discover the cause if possible, and prevent recurrence. 2. A total of more than 3 marginal results in the last 13 consecutive results also signals a need to review process controls. Having 3 marginal results out of 13 samples approximates the 18 percent found as marginal in the baseline studies." "An example of a record of results for cattle testing is shown below for an establishment performing 2 tests a

day."],[{"file\_name":"FSIS\_GD\_1996\_0002","title":"Guidelines for Escherichia coli Testing for Process Control Verification in Poultry Slaughter Establishments","num":"FSIS-GD-1996-0002","id":"5461301f47df3624107b0587ed6273895b6d26e29b4d2c2ecbc05f75a670a801","corpus":"fsis\_guidelines","source\_page\_url":"https://www.fsis.usda.gov/policy/fsis-guidelines","url":"https://www.fsis.usda.gov/sites/default/files/import/Guideline\_for\_Ecoli\_Testing\_Slaughter\_Estab.pdf","type":"pdf","n\_pages":20,"word\_count":6043,"text\_by\_page":[{"text":-----}]}]

Guidelines for Escherichia coli Testing for Process Control Verification in Poultry Slaughter Establishments INTRODUCTION Under the Pathogen Reduction\HACCP Regulation, poultry slaughter establishments are required to test carcasses for generic E. coli as a means of verifying process control. This document outlines sampling and microbial testing procedures that would meet this requirement. These guidelines may be helpful to your company microbiologist or testing laboratory. This document is a supplement to the Regulation but not a substitute; indepth details of microbial sampling and testing may be found in the Regulation. In this protocol, carcass sampling for broiler and turkey carcasses employs the same nondestructive whole bird rinse used in the FSIS Nationwide Microbiological Baseline Data Collection Programs. Poultry carcasses should be sampled at the end of the chill process, after the drip line, and before packing\cut-up. (Hot-boned poultry, which is boned before chilling, should be sampled at the end of the slaughter line instead of at the end of the drip line.) Samples taken in this manner will have analytic results comparable to National Baseline figures. E. coli test levels from National Baseline studies, expressed as colony forming units per milliliter (cfu\ml) of rinsate, have been separated into 3 categories for the purpose of process control verification: acceptable, marginal, and unacceptable. In the Pathogen Reduction\HACCP Regulation, the upper limits for the acceptable and marginal ranges were denoted by m and M.

Table 1. Values for Marginal and Unacceptable Results for E. coli performance criteria Type of Acceptable Range Marginal Range Unacceptable Range poultry over 100 cfu\ml above 1,000 Chicken 100 cfu\ml or but not over 1,000 cfu\ml less cfu\ml Turkey NA \* NA \* NA \*\* The FSIS Baseline study has not been completed for this type of poultry. Levels will be set upon completion of this baseline.", "The E. coli test results for a chicken slaughter establishment will be acceptable if not above 100 cfu\ml, marginal if above 100 cfu\ml but not above 1,000

cfu/ml, and unacceptable if above 1,000 cfu/ml. To evaluate overall process performance, the establishment must apply verification criteria to a set of samples; see discussion on pp. 14-16. If no m/M criteria have been established for the type of birds you are required to sample and analyze, you should use a process control approach. The statistical process control approach required by the Agency is based on the principle that every product is produced by a process. All processes are subject to variation, which should be understood and controlled by statistical methods. A process that is in control is stable in terms of average level and degree of variation, i.e., it is predictable within limits and is thus 'doing its best.' Processes that have not been subjected to analysis are not likely to be in control. Control is attained, often by degrees, by detecting and eliminating special causes of variation, those not present all the time or not affecting all product output. This involves initially evaluating data to determine process capability (the typical process performance level), and then checking subsequent data to see if they are consistent with this baseline level, i.e., the process is in control and variations are within normal and acceptable limits. This is accomplished by checking for unreasonably high results, trends, etc., and looking for and correcting problems in the process when these signals occur. It is important to recognize that an in-control process may not necessarily result in product of the desired quality improvements may be needed or the entire process may require reconsideration. Problems in a process may stem from many sources, for example: inadequate knowledge of how a process should work or how a specific process is performing; errors or deficiencies in executing procedures; failure to recognize the need for preventive measures; unnecessary complexity in the process; and uncontrolled variation among inputs. Specific techniques of statistical process control include the time plot, which charts measurements over time; this is the first technique to use with data collected over time and analyzed for patterns. A further development is the control chart, which plots data over time but also displays an upper control limit for specific measurements, and a centerline, above and below which there is an equal number of sample results (the centerline is in effect a median average). A sample result above the upper control limit would indicate the likely presence of a special cause of variation that should be addressed. Results within control limits indicate simply that the process is in control. Control charts have two essential uses: after-the-fact analysis of process performance and gaining and maintaining control of a process. In most situations more than one type of control chart would be applicable; detailed information can be found in texts on statistical quality control, under the topic "control charts." In general, statistical process control techniques help to provide experience in "process thinking" (a central tenet of HACCP), develop an historical record of performance, evaluate the long-term stability of a process and determine process capability (i.e., how it is actually working), and evaluate the effectiveness of process improvement actions. With specific reference to E. coli test results, statistical process control techniques will not be directly useful for attaining and maintaining control of a process, as,"test results will come from the end of the process and in any case would not be timely enough; observations made earlier in the process would be more useful for attaining and maintaining process control. Rather, E. coli testing would serve to verify process control. Process control techniques, applied and verified in this manner, would accomplish the essential intent of the Regulation by integrating process control and microbial testing into slaughter operations. GUIDELINES FOR SAMPLE COLLECTORS/MICROBIOLOGISTS Pre-sampling Preparation Sample collection shall be conducted by the individuals) designated in the

establishment's written procedures for microbiological sampling, as required by 9 Code of Federal Regulations (CFR) Part 381. 94 (a) (2) (i). These procedures shall also specify the location of sampling, the random sample selection method chosen by the establishment, and sample handling procedures that will ensure sample integrity. Before beginning sample collection, assemble sampling supplies, such as sterile gloves, sterile sampling solutions, hand soap, sanitizing solution, etc. Sterile sampling solutions, such as Butterfield's phosphate diluent (BPD) or buffered peptone water (BPW), can be stored at room temperature; however, at least the day before sample collection, check such solutions for cloudiness and do not use solutions that are cloudy or turbid or that contain particulate matter. To obtain the most accurate results, samples should be analyzed as soon after collection as possible. If samples must be transported to an off-site laboratory, they should be refrigerated and then shipped refrigerated, on the same day they were collected, via an overnight delivery service to the laboratory. A sample should arrive at the laboratory and be analyzed no later than the day after it is collected. If sample collection, pick-up or shipment, and laboratory analysis cannot be carried out within this timeframe, the carcass selected for sampling should be held until the process can be accomplished in the appropriate span of time. The same principle applies for samples that are analyzed in-plant: If a carcass cannot be sampled and the sample analyzed by the day after it is taken, the carcass should be held until this is possible. Rinsate from a collected sample should not be held; it should be either analyzed in-plant by the next day or immediately shipped for overnight delivery to the laboratory that will conduct the analysis. The Sample Shipment section below gives information on shipping containers and transporting samples to off-site facilities.",-----  
-----  
-----

----- Sampling frequency Sampling frequency for E. coli testing is determined by production volume. The required minimum testing frequencies for all but very low volume establishments are shown in Table 2 by type of poultry. An establishment need sample only the predominant type when two or more types are slaughtered. Table 2. E. coli Testing Frequencies Chickens 1 test per 22,000 carcasses, or at least 1 test per week Turkeys 1 test per 3,000 carcasses, or at least 1 test per week NOTE: These testing frequencies do not apply to very low volume establishments. See Table 3. Very low volume establishments Some establishments may be classified as very low volume establishments based on their annual production volume. The maximum yearly slaughter volumes for very low volume establishments are described in Table 3. An establishment need sample only the predominant type when two or more types are slaughtered. Table 3. Maximum Yearly Poultry Slaughter Volumes for Very Low Volume Establishments Type of Poultxy Criteria (Yearly Slaughter Valme) Chickens not more than 440,000 birds Turkeys not more than 60,000 birds Mixed Birds not more than 440,000 total, with not more than 60,000 turkeys A very low volume establishment will sample the predominant type once per week beginning the first full week of operation after June 1, until at least 13 test results have been obtained or the following June 1, whichever comes first. The establishment will repeat the same sampling regime once per year, beginning the first full week of operation after June 1.", "If a very low volume establishment predominantly slaughters a type of poultry for which m\|M criteria have been determined, the establishment must sample once

per week until results show that it has met the m/M criteria outlined in the Pathogen Reduction\HACCP Regulation and following amendments; see Verification Criteria, pp. 14-16. Random selection of carcasses Samples are to be taken randomly at the required frequency. For example, given the frequency of testing for turkeys of one test per 3,000 turkeys slaughtered, if a plant slaughters 1,500 turkeys an hour, one sample will be taken every two hours. Note: If more than one shift is operating at the plant, the sample can be taken on any shift. Poultry carcass selection Different methods of selecting the specific carcass for sampling could be used, but all require the use of random numbers. Examples of methods include random number tables, calculator- or computer-generated random numbers, or drawing cards. The carcass for sampling must be selected at random from all eligible carcasses. If there are multiple lines or chillers, randomly select the line or chiller for sample collection for that interval. Each line should have an equal chance of being selected at each sampling interval. The poultry carcasses will be selected at random after chilling and after the drip line, before packing\cutup. A whole carcass is required, that is, one that has not been trimmed. Aseptic techniques\sampling Extraneous organisms from the environment, hands, clothing, sample containers, sampling devices, etc., may contaminate samples and lead to non-representative analytical results. It is necessary to use aseptic sampling techniques and clean, sanitized equipment and supplies. An area should be designated for preparing sampling supplies. A stainless steel, wheeled cart or table would be useful during sampling. A small tote or caddy could be moved to the location of sampling and used for carrying supplies; sample bags could be placed on the tote or caddy when sterile solutions are added to the bags.", "Sterile gloves should be used for collecting samples. Nothing should contact the external surface of the glove except the exposed sample being collected. Keep in mind that the outside surfaces of the sample container are not sterile. The following procedure for putting on sterile gloves can be followed when collecting samples: a) Peel open the package of sterile gloves from the top without contaminating (touching, breathing on, contacting) the exterior of the gloves. b) Remove a glove by holding it by the inner . surface of the wrist-side opening. Avoid any contact with the outer surface of the glove. Insert the washed and sanitized hand into the glove, taking care not to puncture the glove. c) Next, taking care not to contaminate the outer surface of the glove, repeat the step above for the hand you will use to physically handle the sample. d) If at any time you are concerned that a glove may be contaminated, discard it and begin again with Step a) above. Preparation for Sample Collection On the day of sampling, gather all sample collection bags, sterile gloves, sanitizer, hand soap, sterile solutions for sampling, and any other materials needed. Ensure that all sampling supplies are on hand and readily available before beginning sample collection. Label the sample bags before starting the sampling procedure. Use permanent ink. If you are using paper labels, it is important that the label be applied to the bag at normal room temperature; it will not stick to the sample bag if applied in the cooler. Outer clothing such as frocks, gloves, or head gear worn in other areas of the plant should be removed before entering the sampling area or preparing to collect samples. Replace outer clothing with clean garments, such as a laboratory coat, that have not been directly exposed to areas of the plant outside of the sampling area.", "Sanitize the sample work area surfaces by wiping with a clean disposable cloth or paper towel dipped in a freshly prepared 500 ppm sodium hypochlorite solution (0.05% sodium hypochlorite) or other approved sanitizer that provides an equivalent concentration of available chlorine. The sample work area surfaces must

be free of standing liquid before sample supplies or product containers are placed on them. Before sampling, thoroughly wash and scrub hands to the midforearm. Use antibacterial hand soap. This procedure should include a sanitizer with 50 ppm equivalence available chlorine. Dry the hands using disposable paper towels. Chicken Carcass Rinse Sampling Procedure Material : 1. 2 Sterile 3500 milliliter (ml) stomacher-type or ziplock-type bags or equivalent. The bag must be sterile and should be large enough to hold the carcass while rinsing. 2. 400 ml sterile Butterfield's phosphate diluent (BPD) or sterile buffered peptone water (BPW) 3. Plastic tie wraps or equivalent (to secure the bag) 4. Sterile gloves 5. Sterile leak-proof container (optional) Collection 1. Ensure all sampling supplies are present and have been properly labeled. An assistant may be helpful during sampling. 2. Open a large stomacher-type bag without touching the sterile interior of the bag. (Rubbing the top edges of the bag between the thumb and forefinger will cause the opening to gap for easy opening.) 3. Put on sterile gloves. 4. With one hand, push up through the bottom of the sampling bag to form a 'glove' over one hand with which to grab the bird, while using your other hand to pull the bag back over the hand that", "will grab the bird. This should be done aseptically without touching the exposed interior of the bag. 5. Using the hand with the bag reversed over it, pick up the bird by the legs (hocks) through the stomacher bag. (The bag functions as a 'glove' for grabbing the bird's legs.) Take care not to contaminate the exposed interior of the bag. Allow any excess fluid to drain before reversing the bag back over the bird. 6. Rest the bottom of the bag on a flat surface. While still holding the top of the bag slightly open, add the sterile BPD or BPW (400 ml) to the bag containing the carcass, pouring the solution into the carcass cavity and over the exterior of the carcass. 7. Expel most of the air from the bag, then close the top of the bag. While securely holding the bag, rinse the bird inside and out using a rocking motion for 30 shakes (approximately one minute). This is done by holding the bird through the bottom of the bag with one hand and the closed top of the bag with the other hand. Hold the bird securely and rock it in an arcing motion, alternating the weight of the bird from one hand to the other (motion like drawing an invisible rainbow or arch), ensuring that all surfaces (interior and exterior of the carcass) are rinsed. 8. Rest the bag with the bird on a flat surface and, while still supporting the bird, open the bag. 9. With a gloved hand, remove the carcass from the bag, first letting any excess fluid drain back into the bag. Since the carcass was rinsed with a sterile solution, the bird can be returned to the chill tank. Be sure not to touch the interior of the bag with your gloved hand. 10. Secure the top of the bag so that the rinse fluid will not spill out or become contaminated. 11. Place the sample bag (or leak-proof container) into another bag and secure the opening of the outer bag. 12. a) If samples are to be analyzed at an on-site laboratory, begin sample preparation for the selected method of analysis.", "b) If samples are to be analyzed at an off-site laboratory, follow the Sample Shipment procedures. Turkey Carcass Rinse Sampling Procedure Materials: 1. 2 Sterile 3500 ml stomacher-type or ziplock-type bags or equivalent. The bag must be sterile and should be large enough to hold the carcass while rinsing; the bags FSIS will be using for the Salmonella sampling program measure approximately 18\" x 24\". Large turkeys should be placed in a plain, clear polypropylene autoclave bag, about 2411 x 30" to 36". 2. 600 ml sterile Butterfield's phosphate diluent (BPD) or sterile buffered peptone water (BPW) 3. Plastic tie wraps or thick rubber bands or equivalent, if needed to secure sample bag 4. Sterile gloves 5. Optional - sterile, leak-proof container Collection 1. Ensure that all supplies are on hand and readily available. An assistant will be needed to hold

the bag for collecting the bird. 2. Have an assistant open the large sterile stomacher-type bag (designated for rinsing the carcass) and be ready to receive the turkey carcass. (Rubbing the top edges of the bag between the thumb and index finger will cause the opening to gap open.) 3. Put on sterile gloves. 1","4. Remove the selected turkey from the drip line by grasping it by the legs and allowing any fluid to drain from the cavity. 5. Place the turkey carcass, vent side up, into a sterile sampling bag. Only the carcass should come in contact with the inside of the bag. 6. Manipulate the loose neck skin on the carcass through the bag and position it over the neck bone area to act as a cushion and prevent puncturing of the bag. The assistant will need to support the carcass with one hand on the bottom of the bag. 7. While still supporting the bottom of the bag, have the assistant open the bag with the other hand. Alternatively, rest the bottom of the bag on a pre-sanitized surface (i.e. a table), and while still supporting the carcass in the bag, open the bag with the other hand. 8. Add the sterile BPD or BPW (600 ml) to the bag containing the carcass, pouring the diluent into the carcass cavity and over the exterior of the carcass. 9. Take the bag from the assistant and expel excess air from the bag and close the top. While securely holding the bag, rinse the bird inside and out using a rocking motion for 30 shakes (approximately one minute). This is done by holding the carcass through the bag with one hand and the closed top of the bag with the other hand. Holding the bird securely with both hands, rock in an arcing motion alternating the weight of the bird from one hand to the other (motion like drawing an invisible rainbow or arch), ensuring that all surfaces (interior and exterior of the carcass) are rinsed. 10. Hand the bag back to the assistant. 11. With a gloved hand, remove the carcass from the bag letting excess fluid drain back into the bag. Since the carcass was rinsed with a sterile solution, the bird can be returned to the chill tank. Be sure not to touch the interior of the bag with your gloved hand. 12. Expel excess air, taking care not to expel any rinse fluid. Secure the top of the bag so that the rinse fluid will not spill out or become contaminated.", "13. Place the sample bag (or container) into another bag and secure the opening of the outer bag. 14. a) If samples are to be analyzed at an on-site laboratory, begin sample preparation for the selected method of analysis. (See Analytical Methods section.) b) If samples are to be analyzed at an off-site laboratory, follow Sample Shipment procedures.

**Sample Shipment** Samples analyzed on-site must be analyzed as soon after collection as possible. If no on-site facilities are available, samples must be shipped to an off-site laboratory the same day they were collected. Samples must be analyzed no later than the day after collection. **Shipping containers and coolant packs** It is important that samples fit easily into the shipping containers so that the sample bags do not break. Correct use of the coolant gel-ice packs and proper packing of the shipping container are necessary so that samples arrive at the laboratory at an acceptable temperature (0-10°C). Maintaining samples at improper temperatures may cause inaccurate results. The sample should be kept refrigerated, not frozen, in the shipping container before pickup by the courier service. The shipping container itself should not be used as a refrigerator; however, multiple samples (if needed) for that day may be stored in the open shipping container in the cooler or refrigerator. **Recommended procedure**

1. Prechill shipping container by placing the open shipping container in the refrigerator at least the day before sampling.
2. Place the appropriately-labeled, double-bagged sample in the prechilled shipping container in an upright position to prevent spillage. Newspaper may be used for cushioning the sample and holding it in the upright position. Ensure that samples are maintained at refrigeration temperature. Refrigeration temperatures limit multiplication of any

microorganisms present.", "3. Place a corrugated cardboard pad on top of samples. The corrugated pad prevents direct contact of frozen gel packs with the samples. Next, place the frozen gel pack(s) on top of the corrugated pad. Use sufficient frozen coolant to keep the sample refrigerated (0-10°C) during shipment to the designated laboratory. Insert foam plug and press it down to minimize shipper head space. 4. Ship samples via overnight delivery or courier to the laboratory. Suggested Criteria for Microbiological Laboratories These suggestions are not meant to be exhaustive. Specific needs will vary from one processor to another.

Personnel Both laboratory analysts and supervisors must have education, training, and experience in food microbiology. Specific familiarity with poultry operations would be desirable. Personnel should be well versed in methods of analysis for poultry samples and the organisms associated with poultry products. Facilities Laboratory facilities should be suitable for conducting routine and specialized microbiological analyses and should provide adequate bio-safety precautions. It is crucial that the laboratory maintain separate, defined areas for sample receipt, preparation, and analytic work. Equipment The laboratory should have suitable equipment, appropriate preventive maintenance programs, readily available equipment manuals, and log books for documentation. Specialized equipment may be necessary for some applications. Operations The laboratory should have in place a written quality assurance (QA) program that is available to all employees. The QA program should include bio-safety equipment, media preparation, ","microbiological methods and procedures, control programs, equipment control, culture maintenance, sample receipt, handling, result reporting, and record keeping. Records Records should contain a complete sample description, including condition, source, lot code, date, quantity, etc. Results should be reported promptly and all data and summaries permanently recorded with the results. Analytical Methods All sample analyses must begin no later than the day after collection. Samples must be analyzed using one of the E. coli (Biotype I) quantitation methods found in the Official Methods of AOAC International, 16 th edition, 3 rd revision, 1997, or by any method that is validated by a scientific body in collaborative trials against the 3-tube Most Probable Number (MPN) method and that agrees with the 5% upper and lower confidence limits of the appropriate MPN index. The following methods for generic E. coli quantitation in foods have been AOAC-approved: 1) 3-tube MPN method - AOAC 17.2.01-17.2.02 2) Modified 3-tube MPN method - AOAC 17.3.07 - Substrate Supporting Disc Method (ColiComplete\u00ae). ColiComplete\u00ae Substrate Supporting Discs are available from BioControl Systems, Inc., 19805 North Creek Parkway, Bothell WA 98011. 3) Modified 3-tube MPN method - AOAC 17.4-01 - Fluorogenic Assay for Glucuronidase. Lauryl sulfate tryptose broth with added 4-methylumbelliferyl-O-D-glucuronide (MUG) is used in a 3-tube MPN method. 4) Plating Method - AOAC 17.3.04 - Dry Rehydratable Film (Petrifilm E. coli Count Plate) Method. Medical-Surgical Division\3M, 275-5W 3M Center, St. Paul MN 55144.", "5) Filtration\Plating Method - AOAC 17.3.09 - Hydrophobic Grid Membrane Filter\ MUG (ISO-GRID) Method. QA Life Sciences, Inc., 6645 Nancy Ridge Dr., San Diego CA 92121. Note: For most quantitative assays, week-end laboratory work can be kept to a minimum by refrigeration of incubated plates\tubes until Monday. A programmable refrigerated incubator is useful in such cases. For commercially available methods follow manufacturer's recommendations. Suggested quantitation schemes For poultry rinse fluid samples, if a generic 1 milliliter (ml) plating technique is used for E. coli quantitation, the plate count would not have to be divided to get the count per ml of rinse fluid. Record this value

even if it is less than 1 cfu/ml. To cover the marginal and unacceptable range for E. coli levels, the undiluted extract (optional), a 1:10 and a 1:100 dilution should be plated, preferably in duplicate. Higher or lower dilutions may need to be plated based on the specific product. If a hydrophobic grid membrane filtration method is used, the only difference would be filtration of 1 ml of the undiluted extract (optional), 1:10 and 1:100 dilutions. Additional dilutions of the original extract may need to be used if a 3-tube MPN protocol is used. The 3 highest dilutions positive for E. coli are used to calculate the MPN. Recordkeeping Results of each test must be recorded in terms of colony forming units per milliliter rinse fluid (cfu/ml) for chicken and turkeys. Record this value even if it is less than 1 cfu/ml. A process control table or chart can be used to record the results and facilitate evaluation. Results should be recorded in the order of sample collection and include information useful for determining appropriate corrective actions when problems occur. The information needed for each sample includes date and time of sample collection and, if there is more than one slaughter line, the slaughter line from which the sample was collected. These records are to be maintained at the establishment for twelve months and must be made available to Inspection Program employees on request. For E. coli testing to be most useful for verifying process control, timeliness is important and the record should be updated with the receipt of each new result. Records should also be kept of any corrective", "actions taken if process control deviations are detected through microbiological testing. Note: Occasionally, samples shipped to off-site laboratories may be lost during shipping or may arrive at the laboratory late or outside the acceptable temperature parameters for sample analysis (0-10\u00baC). Any reasons for missing data should be documented.

**APPLYING PERFORMANCE CRITERIA TO TEST RESULTS**

As was stated above on pp. 1-2, E. coli test levels for chickens have been separated into three categories for the purpose of process control verification: acceptable, marginal, and unacceptable. E. coli test results for a chicken slaughter establishment will be acceptable if not above 100 cfu/ml (#@m), marginal if above 100 cfu/ml but not above 1,000 cfu/ml (>m but <M), and unacceptable if above 1,000 cfu/ml (>M).

**Verification Criteria**

Verification criteria are applied to test results in the order that samples are collected. The criteria consist of limits on occurrences of marginal and unacceptable results. As each new test result is obtained, the verification criteria are applied anew to evaluate the status of process control with respect to fecal contamination. This way of looking at the number of marginal and unacceptable results is described in the regulation as a "moving window" approach. With this approach, results are accumulated until 13 have been accrued. After this, only the most recent 13 results - those in the "moving window" are considered.

1. An unacceptable result should trigger action to review process controls, discover the cause, and prevent recurrence.
2. A total of more than 3 marginal or unacceptable results in the last 13 consecutive results also signals a need to review process controls.

An example of a table of results for Chicken testing is shown below for an establishment performing 2 tests per day.", "---

---

	1	2	3	4	5	6	7	8	9	10	11	12	13									
14	15	16	17	Test Time	Test Result	Date Collected (cfu/ml)	Number	Marginal	Result	Result or	Unacceptable	Pass\	Unacceptable?									
14:00	10	No	No	1	Pass	10-08	07:10	150	No	Yes	2	Pass	13:00	50	No	No	2	Pass	10 - 09	10:00		
negative	No	No	2	Pass-	12:20.	10	No	No	2	Pass	10-10	09:20	800	No	Yes	3	Pass	13:30	10	No	No	3
Pass	10-11	10:50	10	No	No	3	Pass	14:50	10	No	No	3	Pass	10-14	08:40	500	No	Yes	4	Fail	12:00	30

No No 4 Fail 10-15 09:30 10 No No 4 Fail 15:20 10 No No 3 Pass 10-16 07:30 10 No No 3 Pass 11:40 10 No No 2 Pass 10-17 10:20 1200 Yes No 3 Fail 118 1 14:40 10 No No 3 Pass", "The following observations can be made regarding this example: 1. As of 10-14 at 08:40 (sample 11), there are 4 marginal or unacceptable results in the last 11 results, which exceeds the limit of 3 in 13 consecutive tests. 2. The limit of 3 in 13 also is exceeded for the next 2 tests, but since no new marginal or unacceptable result has occurred, these failures should not be treated as evidence of a new problem. The log or documentation of corrective action taken for the first failure should be adequate to verify that the deviation or problem, if any, was addressed. 3. On 10-15 at 15:20 (sample 14) the number of marginal or unacceptable results in the last 13 tests goes down to 3 because the marginal result for 10-07 at 08:50 is dropped and replaced by the next, acceptable result as the 13-test window moves ahead 1 test. 4. The result for 10-17 at 10:20 (sample 17) exceeds 1,000 (>M) and is unacceptable. Such a result should trigger immediate establishment review of process controls to discover the cause of the failure, prevent recurrence, and if product has been affected, consider the status and proper disposition of the product. Note, however, that this specific result >M only counts as one result that exceeds m. With the next sample (18) - 10-17 at 14:40 - the establishment is again defined by having no more than 3 samples >m in the last 13. At this point, a negative result would mean that the current set of 13 samples was passing, a marginal result would mean that the set would fail for having 4 results >m in its 13 samples (samples 6-18), and a result >M would mean that sample would fail by exceeding M and the sample set would fail for having 4 results >m in its 13 samples. 5. The result for 10-17 at 14:40 is negative. The set is now passing by virtue of having had no more than 3 results >m in its 13 samples (samples 6-18). This information could also be displayed in chart form, with test numbers, times, dates, and results.", "Billing Code 3410-DM-P DEPARTMENT OF AGRICULTURE Food Safety and Inspection Service (Docket No. 97-041N] Notice of Request for Extension and Revision of a Currently Approved Information Collection AGENCY: Food Safety and Inspection Service, USDA. ACTION: Notice and request for comments. SUMMARY: In accordance with the Paperwork Reduction Act of 1995 and the office of Management and Budget (OMB) regulations, this notice announces the Food Safety and Inspection Service's (FSIS) intention to request an extension for and revision of a currently approved information collection regarding processing procedures and quality control systems. DATES: Comments on this notice must be received on or before [insert date 60 days after publication of this notice]. ADDITIONAL INFORMATION OR COMMENTS: Contact Lee Puricelli, Paperwork Specialist, Food Safety and Inspection Service, USDA, 300 12th Street SW, Washington, DC 20250-3700, (202) 720-0346. SUPPLEMENTARY INFORMATION: Title: Processing Procedures and Quality Control Systems OMB Number: 0583-0089 E2Miration Date of Approval: October 31, 1997. Type of Request: Extension and revision of a currently approved information collection. Abstract: FSIS has been delegated the authority to exercise the functions of the Secretary as provided in the Federal Meat Inspection Act (FMIA) (21 U.S.C. 601 et seq.) and the Poultry Products Inspection Act (PPIA) (21 U.S.C. 451, et seq.). These statutes mandate that FSIS protects the public by ensuring that meat and poultry products are safe, wholesome, unadulterated, and properly labeled and packaged.", "To carry out its responsibility, FSIS has promulgated specific regulations containing requirements for the processing of certain meat and poultry products. FSIS requires that establishments producing cooked beef, roast beef, and corned beef document the time, temperature, and humidity at which the product is cooked and

cooled. FSIS program employees review these records no less than three times a week to ensure regulatory compliance. Establishments canning meat and poultry products must document the date of production; type of product canned; canning process used; size and type of container used; and any time\temperature processing requirements. FSIS program employees review these records no less than three times a week to verify regulatory compliance. Additionally, FSIS permits establishments to develop total quality control (TQC) systems or partial quality control (PQC) programs which provide establishments with flexibility in meeting FSIS's regulations. TQC systems encompass all aspects of product processing; PQC programs cover only a specific processing operation. Quality control systems\programs incorporate inspection activities contained in FSIS's regulations. TQC systems and PQC programs must contain detailed information concerning the manner in which the system will function. Such information must include procedures for raw material control; the nature and frequency of tests to be made; the critical check or control points to be addressed; the nature of charts and other records that will be used; the length of time such charts and records will be maintained; the nature of deficiencies the system is designed to identify and control; the parameters or limits that will be used; and the points at which corrective action will occur and the nature of such corrective action -- ranging from the least to the most severe. FSIS program employees review TQC and PQC system charts and records. FSIS program employees review these records no less than three times a week to ensure regulatory compliance. Because of the continued need for these information collection activities, FSIS is requesting OMB extension for and revision of the Information Collection Request covering information collection activities related to these requirements.", "Estimate of Burden: The public reporting burden for this collection of information is estimated to average 120 hours per response. Respondents: Meat and poultry establishments Estimated Number of Respondents: 6,186 Estimated Number of Responses per Respondent: 2,292 Estimated Total Annual Burden on Respondents: 743,750 hours Copies of this information collection assessment and comments can be obtained from Lee Puricelli, Paperwork Specialist, Food Safety and Inspection Service, USDA, 300 12th Street SW, Room 109, Washington, DC 20250-3700, (202) 720-0346. Comments are invited on: (a) whether the proposed collection of information is necessary for the proper performance of FSIS's functions, including whether the information will have practical utility; (b) the accuracy of FSIS' estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on those who are to respond, including through use of appropriate automated, electronic, mechanical, or other technological collection techniques, or other forms of information technology. All responses to this notice will be summarized and included in the request for OMB approval. All comments will also become a matter of public record. Thomas J. Billy Administrator"]}, {"file\_name": "FSIS\_GD\_2008\_0003", "title": "Food Safety and Inspection Service (FSIS) Compliance Guide on the Determination of Processing Aids", "num": "FSIS-GD-2008-0003", "id": "8fb0ccb1e3be736fcbb6171a1d4b195a326e15e0cccd3889694446883976d5c9", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Determination\_of\_Processing\_Aids.pdf", "type": "pdf", "n\_pages": 2, "word\_count": 484, "text\_by\_page": ["Letter to

Industry - July 13, 1998 Dear Sir or Madam: This is to acknowledge receipt of your request for USDA evaluation of your chemical compound(s). We must advise you, however, that it is unlikely that we will be able to consider your request. On August 25, 1997, in an effort to clarify and consolidate the sanitation requirements for meat and poultry establishments, FSIS proposed to eliminate the regulatory requirement for prior approval of certain nonfood compounds and proprietary substances (62 FG 45045). More recently, FSIS published a notice in the Federal Register ( 63 FR 7319; February 13, 1998) stating that the Agency is eliminating the prior approval program for nonfood compounds and proprietary substances. The staff engaged in the evaluation process is being assigned to other, high priority tasks. Consequently, it is unlikely that FSIS will complete the review of your request. Therefore, your compound(s) will not be listed in the final update to the List of Nonfood Compounds and Proprietary Substances. USDA-inspected establishments have a responsibility to ensure that they do not use chemical compounds in a way that will result in the adulteration of the food they produce. To assist official establishments in avoiding such a result, FSIS is developing a compliance guide for meat and poultry establishments concerning the appropriate use of nonfood compounds and proprietary substances. Once completed, the compliance guide will be available not only to the regulated industry, but also to chemical manufacturers and the general public. FSIS also is developing an instructional directive for inspection personnel on how to verify that meat and poultry establishments are using nonfood compounds and proprietary substances in a manner that will not adulterate product. This directive will be available to the public, the regulated industry, and to chemical manufacturers. The information that you submitted will be retained in our files pending a final decision on the proposed rule. Thank you for your interest in USDA's authorization program and for your patience during this transition. Sincerely, \s\ William J. Hudnall Assistant Deputy Administrator Standards and Methods Review Last Modified Sep 30, 2013"]}, {"file\_name": "FSIS\_GD\_2008\_0004", "title": "Guidance on Meaning of \"Prohibited Substances\" in FSIS Actions on the Use of Ingredients in Meat and Poultry Products", "num": "FSIS-GD-2008-0004", "id": "fd8a79ba35be9424b128aa42dc60323163c5e31fbadceb56c7d92cfb42801bf", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Prohibited\_Substances\_in\_FSIS\_Actions\_on%2B\_Use\_of\_Ingredients.pdf", "type": "pdf", "n\_pages": 2, "word\_count": 744, "text\_by\_page": ["Food Safety and Inspection Service United States Department of Agriculture Washington, D.C. 20250-3700 News and Information FSIS Constituent Update: December 17, 1999 FSIS Final Rule on Irradiation of Meat to Publish Next Week; Agency Will Hold Constituent Briefing on December 21 The final rule, \"Irradiation of Meat Food Products,\" is expected to publish in the Federal Register December 23. Constituents were faxed a December 14 USDA news release on the approval of the irradiation of meat to help improve food safety. A briefing for constituent groups on the final rule will be held on December 21 at 2:00 p.m. in Room 3109-South Building. For more information, contact: Patrick Clerkin, Associate U.S. Manager for Codex, at (202) 205-7760. FSIS Notices FSIS issued the following two notices on December 15, 1999: FSIS Notice 45-99--\"Residue Testing Program\" FSIS Notice 46-99--\"Documentation of HACCP 02 Procedure\" Copies of the notices are available by faxing requests to: Barbara O'Brien, CPA Constituent Affair Specialist, at (202) 720-5704. Clarification--Packing Dates on Poultry Labeling Recently, an issue regarding the appropriate application of the Federal poultry products inspection regulations on \"date of packing\" (9 CFR 381.126) arose. The circumstances involved a processor who packages poultry food products in consumer-ready film-wrapped packages that are in refrigerated storage awaiting shipment to customers when orders are received. At the time an order is received, a price label and sell-by date is applied to the consumer packages that are then placed in master shippers to which box end labeling, including a \"pack date,\" is applied. The pack date that has

been applied, however, has been the date the consumer packages are placed in the shipper, not the original pack date on which the poultry was slaughtered and placed in the consumer packaging. The application of the date the consumer packages are placed in the shipper does not constitute the \"pack date\" that is required by Federal regulations. The regulations indicate that the pack date can be applied to the shipper or immediate containers of poultry food products using either a code or the actual calendar date of packing. The date of packing is the original date the poultry is slaughtered and placed in the consumer packaging; the use of any other calendar date will mislead consumers. After discussions with the company and the National Chicken Council, it was resolved that, perhaps, misinterpretation of the pack date provisions has occurred within industry. Understanding that the immediate containers or the shipping containers of poultry food products must be marked with the original pack date, there are actually three options available to poultry processors to comply with the packing date provisions, one of which must be used. These options are: a code is applied that represents the original pack date of the poultry food product in the consumer package, or the original pack date of the poultry food product is applied to the consumer package or the shipping container", "accompanied by an explanatory statement, e.g., \"packing date\" (per 9 CFR 381.129 (c) (2)), or the original pack date of the poultry food product is applied to the consumer package or the shipping container along with a date representing when the consumer packages are placed in shippers. In this case, each date must be accompanied by an explanatory statement in accordance with 9 CFR 381.129 (c) (2), e.g., \"packing date,\" and \"date put in shipping container.\" For more information, contact: Dr. Robert Post, Director, Labeling and Additives Policy Division, at (202) 205-0279. \*Editor's Note: Attachments are sent with faxed versions of this report only. Links will be provided to electronic copy, when available. For Further Information Contact: FSIS Constituent Affairs Program Phone: (202) 720-9113 Fax: (202) 720-5704 E-mail: LisaWallenda.Picard@fsis.usda.gov FSIS Update Menu | FSIS Home Page | USDA Home Page"]}, {"file\_name": "FSIS\_GD\_2008\_0005", "title": "Questions and Answers - FSIS Directive 6100.4 - Verification Instructions Related to Specific Risk Materials", "num": "FSIS-GD-2008-0005", "id": "e6c89251cad44a7c80e4c8e14d394b97563c4db4ed1bd3bee40e07a55e1876b9", "co\_rpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/QA\_6100.4.pdf", "type": "pdf", "n\_pages": 15, "word\_count": 5975, "text\_by\_page": ["1 FSIS has developed the following guidance for water, ice and solution reuse. ICE REUSE Ice from ice packed poultry may be reused to repack raw whole birds or parts. The following are recommended: \* Establish a procedure to assure that ice is collected and held in a container that drains freely and in a sanitary manner. The procedure should address collection and washing of ice before it is reused. \* Establish a procedure for identifying reused ice from fresh ice. \* The ice or the product should be packaged in an impervious, sealed container, such as a plastic bag, to prevent direct contact between the product and ice. \* Ice used on raw product should not be reused on any partially- or fully-cooked product. \* The ice should be free of any observable foreign material as well as large particles of poultry meat and fat. If the ice is washed, continuous drainage should be maintained during the washing procedure. \* Ice from damaged containers should not be used. \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "2 BRINE REUSE Brine may be reused to chill cooked product for various

lengths of time based on the type of casing, salinity, and temperature. Brine solution that is reused to chill raw or heat-treated, but not fully cooked product ( e.g., smoked bacon) should be reconditioned in a manner to prevent the brine solution from becoming contaminated and adulterating the product. Brine reuse to chill raw product should follow the same criteria as brine reused to chill heat-treated, not fully cooked product. The following are recommended: \*

\* Establish procedures for monitoring the temperature, salinity, and free chlorine concentration of the brine being reused to chill heat-treated product.

\* Establish an ongoing microbiological plan to ensure that the brine solution is maintained pathogen free. The monitoring plan should cover the type and frequency of any microbiological analysis, action limits (upper\lower control limits), and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reused brine solution:

Cooked Product Analysis Frequency Action Level Total Plate Count Daily >2500 cfu\ml Total Coliform Weekly Positive Fecal Coliform Weekly Positive Raw or Heat-Treated, Not Fully Cooked Product (i.e. Bacon Bellies) Analysis Frequency Action Level Total Plate Count Daily >5000 cfu\ml Total Coliform Weekly >10 cfu\ml Fecal Coliform Weekly Positive \*

Initially, frequency of microbial testing should be at the highest level until control is established. Reduced testing may be appropriate once control has been established.", "3 However, loss of control may necessitate a return to increased testing frequency until system controls are reestablished.

\* Visible contamination defects should be removed from the product before it is placed in the brine solution.

\* The solution should be kept free of visible meat and fat particles and other objectionable conditions by effective methods such as filtration, skimming, or overflow.

\* When the brine solution is used without reconditioning for one shift or longer, the solution should be discarded at the following specified intervals, and all equipment, tanks, lines should be thoroughly cleaned and sanitized:

Heat-Treated Product Duration of Use (Classes)

Additional Conditions One production All Classes: None shift No casing Perforated casing Edible casing Semipermeable casing Impermeable casing Up to 24 hours All classes: 1. Minimum salt 5% No casing (19\u00b0F salimeter) Perforated casing 2. Maintain 40\u00b0F. Edible casing or lower Semipermeable casing Impermeable casing Up to 1 week One class: 1. Minimum salt 9% Semipermeable casing (32\u00b0F salimeter) Impermeable casing 2. Maintain 28\u00b0F. or lower Up to 4 weeks One class: 1. Minimum salt 20% Semipermeable casing (76\u00b0F salimeter) Impermeable casing 2. Maintain 10\u00b0F. or lower", "4

\* Cooked product, for example frankfurters, cannot be chilled in a brine solution that has been used to chill raw or heat-treated, not fully cooked product, for example, bacon bellies. (Raw product may be chilled after cooked product).

\* Products with semipermeable or impermeable casing that are being chilled in brine that is being reused for longer than 24 hours should be trimmed if they have broken casings or have been similarly exposed. The trimmings should be discarded as inedible.

\* A free chlorine concentration of 1-5 ppm should be maintained in the reuse brine solution.

\* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "5

**COOK AND CHILL WATER REUSE**

Water may be reused to cook product and to chill cooked product. The following are recommended:

\* Establish procedures for monitoring the temperature of the cook or chill water, and free chlorine concentration of the chill water being reused to chill cooked product.

\* Establish an ongoing microbiological plan to ensure that the reuse cook or chill water is maintained pathogen free. The monitoring plan should cover the type and frequency of any microbiological analysis, action limits (upper\lower control limits), and

actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reused cook and\or chill water: Chill Water Analysis Frequency Action Level Total Plate Count Daily >500 cfu\ml Total Coliform Weekly Positive Fecal Coliform Weekly Positive Turbidity Weekly >5 NTU Cook Water Analysis Frequency Action Level Total Plate Count Daily >500 cfu\ml Gas Forming Anaerobes Weekly >10 cfu\ml Total Coliform Weekly Positive Turbidity Weekly >5 NTU \* Initially, frequency of microbial testing would be at the highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing frequency until system controls are re-established. \* Visible contamination defects should be removed from the product before it is placed in the cook and\or chill water. \* The cook or chill water should be kept free of visible meat and fat particles and other objectionable conditions by effective methods such as filtration, skimming, or overflow.", "6 \* The chill water should be maintained at a temperature of 50\u00b0 F. or less. \* The cook water should be maintained at a temperature of 150\u00b0 F. or higher. \* A free chlorine concentration of 1-5 ppm should be maintained in the reuse chill water \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "7 PROPYLENE GLYCOL REUSE Propylene glycol solution may be reused to chill raw product such as hamburger chubs, sausage chubs, and bagged poultry for up to an indefinite length of time. The following are recommended: \* Establish procedures for monitoring the temperature, propylene glycol concentration, and free chlorine concentration of the propylene glycol solution being reused to chill raw product. \* Establish an ongoing microbiological plan to ensure the continuous safety of the propylene glycol solution. The monitoring plan should cover the type and frequency of any microbiological analysis, action limits (upper\lower control limits), and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reused propylene glycol solution: Analysis Frequency Action Level Total Plate Count Weekly >500 cfu\ml Total Coliform Weekly >10 cfu\ml Fecal Coliform Weekly Positive \* Initially, frequency of microbial testing should be at the highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing frequency until system controls are re-established. \* Visible contamination defects should be removed from the product before it is placed in the propylene glycol solution. \* The propylene glycol solution should be kept free of visible meat and fat particles and other objectionable conditions by effective methods such as filtration, skimming, or overflow. \* The propylene glycol solution should be maintained at a temperature of 10\u00b0 F. or less during production hours and 40\u00b0 F. or less during nonproduction hours. \* The propylene glycol should be of a type that is authorized for use for immersion freezing of meat and poultry products. \* The product should be enclosed in a package that does not allow the propylene glycol solution directly or indirectly", "8 to contact it. It is recommended that product be enclosed within an impervious package. \* Products that are exposed to the propylene glycol solution should be appropriately handled as contaminated product. One appropriate way of handling the contaminated product would be to rewash the product by water spraying. All traces of refrigerant should be removed before product is passed for food. If water washing or trimming cannot remove all contamination, the affected portion should be condemned. \* The propylene glycol solution should be adequately removed from the

packaged products after freezing and before placing into shipping containers by effective methods such as water spray washing equipment. \* A free chlorine concentration of 1-5 ppm is recommended to be maintained in the propylene glycol. \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "9 CHILLER OVERFLOW WATER REUSE Overflow water from the poultry chilling units may be reused to move heavy solids in eviscerating troughs (not to flush sides of trough), scald tank, picker aprons, and washing picking room floors. The following are recommended: \* Establish a procedure to assure that chiller overflow water is collected and used in a sanitary manner. \* Chiller overflow water added to the scalding should be a minimum of 140\u00b0 F. \* The use of chiller overflow water to rinse picker aprons and wash picking room floors should be used in a manner that prevents cross-contamination to other areas of the plant such as that due to employee traffic. \* The chiller overflow water should be kept free of visible solids. \* The chiller overflow water is collected and handled in a sanitary manner. \* Establish an ongoing microbiological plan to ensure that the chiller overflow reuse water is maintained pathogen free. The monitoring plan should cover the type and frequency of any microbiological analysis, action limits (upper\lower control limits), and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reused chiller overflow water: Analysis Frequency Action Level Total Coliforms Weekly Positive Fecal Coliforms Weekly Positive Salmonella Weekly Positive Staphylococcus aureus Weekly Positive (coagulase positive staphylococci) \* Initially, frequency of microbial testing should be at the highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing frequency until system controls are re-established. \* Establish procedures to correct deficiencies that occur and", "10 to prevent reoccurrence.", "11 CONDENSER OR COMPRESSOR WATER REUSE Water from condensers or compressors may be reused in edible and inedible product areas providing that it is maintained pathogen free. The following are recommended: \* The reuse condenser or compressor water should be collected and handled in a sanitary manner. \* The reuse condenser or compressor water should be maintained in a manner that prevents the solution from becoming contaminated with coliforms, oil and grease, refrigerant, or heavy metals that can adulterate product. \* A free chlorine concentration of 1-5 ppm should be maintained in the reuse condenser or compressor water. \* An ongoing monitoring plan should be established to ensure that the reuse condenser and compressor water is maintained pathogen free. The monitoring plan should cover the type and frequency of any physical, chemical, and microbiological analysis, action limits (upper\lower control limits), and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reuse chill water: Analysis Frequency Action Level Total Plate Count Weekly >500 cfu\ml Total Coliform Weekly Positive Fecal Coliform Weekly Positive Turbidity Weekly no samples > 5 NTU \* Initially, frequency of microbial testing should be at the highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing frequency until system controls are re-established. \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "12 REUSE WATER TO FLUME CHICKEN FEET (PAWS) Poultry chiller overflow water and water used to flume chicken feet (paws) may be used to flume chicken feet including through an in-line paw chiller.

The following are recommended: \* Potable water should be added periodically to prevent organic matter buildup. \* The chiller overflow water and paw flume water should be kept free of visible solids. \* A free chlorine concentration of 1-5 ppm should be maintained in the reuse water used to convey chicken feet (paws). \* An ongoing microbiological monitoring plan should be established to ensure that the reuse chiller overflow water and paw flume water used to flume chicken paws is maintained pathogen free. The monitoring plan should cover the type and frequency of any microbiological analysis, action limits (upper\lower control limits), and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reuse chiller overflow water and paw flume water: Analysis Frequency Action Level Total Coliforms Weekly Positive Fecal Coliforms Weekly Positive Salmonella Weekly Positive Staphylococcus aureus Weekly Positive (coagulase positive staphylococci) \* Initially, frequency of microbial testing should be at the highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing frequency until system controls are re-established. \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "13 REUSE WATER USED TO WASH LIVESTOCK PENS, TRUCKS, POULTRY CAGES, AND SIMILAR AREAS Water from establishment's secondary and tertiary wastewater treatment facility or other processing water may be reused to wash livestock pens, trucks, poultry cages, and other similar areas. The following are recommended: \* Water from the establishment's wastewater treatment facility or other processing water used for washing should be kept free of visible solids. \* A free chlorine concentration of 1-5 ppm should be maintained in the reuse water. \* The water from the establishment's wastewater treatment facility or other processing water should be collected and handled in a sanitary manner. \* The establishment\u2019s wastewater treatment system must not be treating human waste. Human waste must be kept separate from plant waste and not commingled at the wastewater treatment system. \* An ongoing microbiological monitoring plan should be established to ensure that the reuse water from the establishment's wastewater treatment facility or other processing water are maintained pathogen free. The monitoring plan should cover the type and frequency of any microbiological analysis, action limits (upper\lower control limits), and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reuse water from the establishment's wastewater treatment facility or other processing water: Analysis Frequency Action Level Total Coliforms Weekly Positive Fecal Coliforms Weekly Positive Salmonella Weekly Positive Staphylococcus aureus Weekly Positive (coagulase positive staphylococci) \* Initially, frequency of microbial testing should be at the", "14 highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing until system controls are re-established. \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "15 REUSE WATER USED TO WASH INEDIBLE PRODUCT AREAS Water from throughout the plant may be reused in inedible product areas (i.e. washing offal sump screen, flushing feather flow-away troughs, flushing eviscerating troughs that are covered with metal plates, etc.). The following are recommended: \* The reuse water should be used in a manner that prevents cross-contamination to other areas of the plant such as that due to employee traffic. \* The reuse water used should not violate any OSHA requirements. \* The reuse water

used in inedible areas under FDA jurisdiction, such as pet food areas, must also meet FDA requirements. \* The reuse water should be kept free of visible solids. \* The reuse water is collected and handled in a sanitary manner. \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "16 REUSE WATER FROM AN ADVANCED WASTEWATER TREATMENT FACILITY Reuse water from an advanced wastewater treatment facility may be used on edible product (but not in product formulation) and throughout the plant in edible and inedible production areas. The following are recommended: \* An advanced wastewater treatment facility should meet EPA requirements. \* The establishment\u2019s advanced wastewater treatment must not be treating human waste. Human waste must be kept separate from plant waste and not commingled at the advanced wastewater treatment facility. \* The establishment should have qualified and trained personnel who monitor, regulate, and record the wastewater treatment system. \* The establishment should have a program in place that identifies, monitors, and records the treatment measures necessary for safe and effective operation of the wastewater treatment facility. \* The potable and reuse water lines should be identified and separated except at junctions where appropriate valves, etc. protect the potable water supply. \* Dual check valves, alarms, etc., should be in place in case the reuse water system malfunctions to prevent the reuse water from contaminating the potable water supply. \* A \"Fail-Safe\" system should be in place to prevent substandard reuse water from entering the \"end use\" part of the system and contaminating edible product. \* A final potable water rinse should be applied to any edible product and any equipment that contacts reuse water. \* The \"End Use\" reused water should be monitored and tested daily to ensure that the reuse water meets the criteria for the intended use. \* The reuse water should meet the following \"Safe for the Intended Use\" EPA Criteria: 1. Microbiological analysis a. Total Aerobic Plate Count \u2264 500 CFU/ML b. Total Coliforms - None", "17 c. E. coli - None 2. Chemical analysis Total Organic Carbon (TOC) \u2264 100 MG/L 3. Physical analysis Turbidity - \u22645% of samples analyzed \u2265 1 NTU by EPA nephelometry method or equivalent method; no samples > 5 NTU 4. The reuse water should be tested for heavy metals at least once a year and meet the appropriate EPA Maximum Contaminant Levels (MCL\u2019s). \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence.", "18 REUSE WATER IN VAPOR LINES FROM DEODORIZERS Water in vapor lines from deodorizers (condensers) used in preparation of lard and similar edible product may be reused for the same identical use. The following are recommended: \* The complete drainage and disposal of the reused water, effective cleaning of the equipment, and renewal with fresh potable water should be accomplished often enough to assure an acceptable supply of reuse water for the preparation of lard and similar edible product. \* The reuse water in vapor lines from deodorizers should be maintained in a manner that prevents the solution from becoming contaminated such as with coliforms, oil, or grease that can adulterate the product. \* An ongoing monitoring plan should be established to ensure that the reuse water in vapor lines from deodorizers is maintained pathogen free. The monitoring plan should cover the type and frequency of any physical, chemical, and microbiological analysis, action limits (upper/lower control limits), and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reuse water: Analysis Frequency Action Level Total Plate Count Weekly >500 cfu/ml Total Coliform Weekly Positive Fecal Coliform Weekly Positive Turbidity Weekly No samples > 5 NTU \* Initially, frequency of

microbial testing should be at the highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing frequency until system controls are re-established. \* Establish procedures to correct deficiencies that occur to prevent reoccurrence.", "19 Reuse Water From Single Or Multiple Point Sources Can Be Used For Single Or Multiple Point Sources In The Slaughter Process Reuse water from any slaughter process location(s) (e.g., scalding, inside\outside bird washer, chiller overflow water, etc) can be used at any location(s) in the slaughter process including the chiller make-up water and for general sanitation purposes. For example, chiller overflow water and water from the final bird washer that are reconditioned and meet the criteria listed below can be reused in the scalding, throughout the eviscerating line, inside\outside bird washer, final bird washer, chiller make-up water and for general sanitation purposes. Consequently, since the reuse water can replace potable water used during the slaughter process, it needs to meet a higher water reuse standard than pathogen free. The following are recommended: \* Establish procedures for monitoring turbidity and concentration of the water being reused during the slaughter process. \* A free chlorine concentration of 1-5 ppm should be maintained in the reuse water. \* The potable and reuse water lines should be identified and separated except at junctions where appropriate valves, etc, protect the potable water supply. \* A system should be in place to prevent substandard reuse water from entering the \u201cend use\u201d part of the system and contaminate edible product. \* Establish an ongoing microbiological plan to ensure the continuous safety of reuse water during the slaughter process. The monitoring plan should cover the type and frequency of any microbiological analysis, and action limits (upper\lower control limits) and actions taken to ensure product safety when those limits are exceeded. It is recommended that the establishment perform the following ongoing monitoring of the reconditioned water:

Analysis Frequency Action level Total Plate Count Weekly >500 cfu\ml Total Coliform Weekly Positive Fecal Coliform Weekly Positive Turbidity Daily >5 NTU", "20 \* Initially, frequency of microbial testing should be at the highest level until control is established. Reduced testing may be appropriate once control has been established. However, loss of control may necessitate a return to increased testing frequency until system controls are re-established. \* Establish procedures to correct deficiencies that occur and to prevent reoccurrence."], {"file\_name": "FSIS\_GD\_2010\_0001", "title": "Mobile Slaughter Unit Compliance Guide", "num": "FSIS-GD-2010-0001", "id": "12a87adef7f93489a2eb171c587cc0d205267255d2c2a6bd3248ce96aa2c99e", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/media\_file/2021-04/Compliance\_Guide\_Mobile\_Slaughter.pdf", "type": "pdf", "n\_pages": 10, "word\_count": 3507, "text\_by\_page": ["12/20/01 (Additional Questions May Lead to Updated Versions in the Future) IRRADIATION Q\u2019s & A\u2019s LABELING ISSUES 1. Is the Agency reviewing labels for irradiated products or products containing an irradiated meat or poultry component or can such labels be generically approved? Such labels must be evaluated by FSIS\u2019s Labeling Consumer Protection Staff (LCPS), Labeling Compliance Team (LCT), for an initial sketch approval. Subsequent changes permitted by the generic labeling regulations (9 CFR 317.5 and 381.133) do not require re-approval through FSIS. However, FSIS will be tracking the types and numbers of labels for irradiated products and products containing irradiated meat or poultry

ingredients for possible future rulemaking. 2. Does the radura (irradiation logo) have to be green as was previously required by the poultry regulations? No. There are no longer any specific color requirements. However, other countries may have different or additional requirements for importation of irradiated products. 3. Are the labeling requirements for irradiated poultry the same as those for beef? Yes. The labeling requirements are identical for meat and poultry products with respect to irradiation. 4. When \u201cirradiated\u201d is part of the product name, e.g., \u201cIrradiated Beef,\u201d what other irradiation labeling is required? The product labeling also must bear the radura. 5. If a label bears the radura and a \u201ctreated with radiation\u201d statement, but, the company chooses to put the term \u201cirradiated\u201d with the product name, e.g., \u201cirradiated beef patties,\u201d does the term \u201cirradiated\u201d become part of the product name and need to be one third the size of the largest letter in the product name? Yes. Even though, in this case, the term \u201cirradiated\u201d is not required as part of the product name, if a company chooses to include \u201cirradiated\u201d as,"part of the product name, the product name sizing rules (i.e., no letter in the product name can be less than one third the size of the largest letter in the product name.) will apply. 6. How can irradiated beef be identified in the ingredients statement of a multiingredient product? Irradiated beef can be listed in the ingredients statement either as \u201cIrradiated beef,\u201d or \u201cBeef, treated by irradiation.\u201d The acceptability of similar identifications of irradiated ingredients will be handled on a caseby-case basis. 7. If a beef carcass is irradiated and then broken down into primal and retail cuts, how would the primal and retail cuts be labeled? The labeling of all single-ingredients products made from an irradiated carcass must bear the radura and either the term \u201cirradiated\u201d as part of the product name or the inclusion of a statement, such as, \u201cTreated with Radiation\u201d or \u201cTreated by Irradiation.\u201d Such labeling would also be required at the grocery store for product that is packaged and placed in the display counter for consumers. 8. What are the requirements for labeling bulk irradiated product at retail, e.g., irradiated beef in a butcher shop? Point of purchase identification of an irradiated meat or poultry product can be by a label on the package or by the use of placards or brochures located next to the product. 9. If ground beef is manufactured from irradiated beef or irradiated beef trimmings, would it be labeled as \u201cGround Irradiated Beef?\u201d The product labeling would be required to include the radura and a statement, such as, \u201cTreated with Radiation\u201d or \u201cTreated by Irradiation.\u201d If \u201cirradiated\u201d is part of the product name, e.g., \u201cGround Irradiated Beef,\u201d or \u201cIrradiated Ground Beef,\u201d the statement is not required. Additionally, labeling a product as \u201cGround Irradiated Beef\u201d still requires the product must meet the standard for ground beef. 10. How would a ground beef product be labeled if it was a combination of irradiated beef and non-irradiated beef? All that would be required on the label would be to list \"beef\" and \"irradiated beef\" or \"beef, treated by irradiation\" in the ingredients statement. However, in addition to the ingredients statement declaration, the product label could include the radura and the required statement or the radura and a product name which indicated the combination, e.g., \"\u201cIrradiated Ground Beef and Ground Beef,\u201d or \u201cGround Beef and Irradiated Ground Beef,\u201d depending on the order of predominance. 11. What is the proper way to label a fabricated multi-ingredient product, e.g., fresh sausage, made with only non-fluid seasonings and irradiated beef, which is then packaged and irradiated? The fresh

sausage label would bear the radura and either be labeled as \u201cirradiated\u201d sausage or contain a required statement, such as, \u201cTreated with radiation\u201d or \u201cTreated by irradiation.\u201d Secondly, the sausage ingredients statement would identify the beef as either \u201cIrradiated beef\u201d or \u201cBeef, treated by irradiation.\u201d 12. Would an irradiated meat or poultry component used in a multi-ingredient product need to be labeled as \u201cirradiated\u201d in the ingredients statement of the multi-ingredient product, if the finished product is also irradiated? Yes. 13. Do point-of-purchase labeling requirements apply to restaurants? No. There are no labeling requirements for irradiated products at restaurants. However, FSIS is aware of several restaurants that voluntarily disclose irradiation information on menus and encourages this type of disclosure. 14. What labeling statements about the purpose of radiation processing have been authorized for use on labeling in conjunction with the radura in addition to or instead of \u201cTreated with radiation\u201d or \u201cTreated by irradiation?\u201d FSIS has reviewed and approved the following statements: \u201cTreated with irradiation for your food safety\u201d \u201cTreated with irradiation for food safety\u201d \u201cTreated with irradiation to improve food safety\u201d \u201cTreated with irradiation to reduce the potential for foodborne illness\u201d \u201cTreated with irradiation to reduce E. coli bacteria\u201d \u201cTreated with irradiation to reduce pathogens such as E. coli and Salmonella\u201d \u201cIrradiated for your food safety\u201d \u201cIrradiated for food safety\u201d 15. Would FSIS consider the term \u201cpasteurized\u201d as an acceptable term to describe the irradiation process? At this time, labeling statements or claims for irradiated products that include the term \u201cpasteurization\u201d are misleading. FSIS will continue to \u201cexamine this term in light of developments in irradiation technology and FDA policy. In the future, use of the term \u201cpasteurization\u201d will be considered on a case-by-case basis and would require significant documentation and validation as to process controls that demonstrate that vegetative cells of pathogens have been reduced to safe levels and produces a ready-to-eat product. 16. We are aware that steam-pasteurization is currently permitted, and that labeling can state that the product was steam-pasteurized. Why is the phrase permitted on such product if not permitted on irradiated product? The use of steam-pasteurization is only permitted for whole carcasses and parts of carcasses that are to be further processed. Moreover, the labeling of further processed products, such as retail cuts (e.g., ground beef, steaks) and offal (e.g., tripe, intestines, etc.) with statements about reductions in microorganisms or the use of the term \u201csteam-pasteurized\u201d is not permitted because it is misleading to consumers. 17. Can the terms \u201call,\u201d \u201cpure,\u201d and \u201c100%\u201d be used on irradiated beef? Yes. The regulations in 9 CFR 317.8(b)(34) and 381.129(b)(5) specify the terms \u201call,\u201d \u201cpure,\u201d \u201c100%,\u201d and terms of similar connotation shall not be used on labels for products to identify ingredient content unless the product is prepared solely from a single ingredient. Thus, irradiated, single ingredient meat or poultry can be labeled in this manner. 18. Is a \u201cNo MSG Added\u201d claim acceptable on irradiated ground beef? Since MSG is not classified as a non-fluid seasoning, it is not permitted to be in a product that is subsequently irradiated. Therefore, a \u201cno MSG added\u201d claim is a \u201cnegative claim\u201d and may only be used if accompanied by the statement \u201cUSDA regulations do not permit the addition of MSG to irradiated products.\u201d 19. Can an irradiated product be labeled as \u201cnatural\u201d or \u201ccertified Organic by (a

certifying entity)?\u201d The term \u201cnatural\u201d can not be used since FSIS considers irradiation to be more than minimal processing. Thus, such products would not meet the \"natural\" criteria established by Policy Memo 55. Regarding the use of \u201ccertified Organic by (a certifying entity),\u201d we are not aware of any organization providing organic certification that allows the use of irradiation. Further, on March 13, 2000, AMS issued a re-proposed regulation on organic agricultural products which does not permit the use of irradiation on products labeled \u201corganic.\u201d", "20. How can a company label a box containing a variety of meat or poultry products including some that are irradiated and some that are not irradiated? It must be perfectly clear to consumers which products are irradiated and which products are not irradiated. The best method of conveying this information is to include \u201cirradiated\u201d as part of the product name on the principal display panel of all irradiated products as well as the radura on the label. 21. Does the labeling of the shipping container of irradiated products require inclusion of the radura and other required information? Not for a true shipper that is only labeled with the inspection legend and a handling statement, if necessary, and that holds fully labeled products. 22. Can whole livestock blood (dried or fluid) be irradiated? Yes. Whole blood is considered a byproduct which can be irradiated provided it does not contain additives, e.g., sodium citrate as an anticoagulant. 23. If pork is irradiated to eliminate trichinae, can the pork be labeled as \u201ccertified pork?\u201d Yes, if irradiation, in compliance with requirements in 21 CFR 179.26 for treatment of *trichinella spirallis*, is used to treat pork and the company demonstrates that viable trichinae have been destroyed or rendered ineffective in causing infection, the resulting pork can be labeled as \u201ccertified pork.\u201d Additionally, all of the other labeling requirements for the irradiated product, i.e., use of the radura and the required statement or the radura and \u201cirradiated\u201d as part of the product name would be required. Furthermore, when such irradiated pork is used in a secondary product, the ingredients statement must identify the pork as \u201cirradiated Pork\u201d or \u201cPork, treated by irradiation.\u201d", "INGREDIENT ISSUES 1. Consider this situation: A company intends to use irradiated beef in its beef patty; however, it is concerned about the availability of the irradiated beef component. Can the company use \u201cand\u201d or \u201cmay contain\u201d labeling with respect to the irradiated beef component? No. Consumers wishing to purchase products containing an irradiated meat component consider the irradiated meat to be a \u201cvaluable\u201d constituent of the finished product. FSIS labeling regulations do not include provisions for \u201cand\u201d labeling and policies have not permitted the use of a \u201cmay contain\u201d statement in reference to a \u201cvaluable\u201d component, e.g., truffles, veal, etc. FSIS policies have only permitted the use of a \u201cmay contain\u201d statement with \u201cminor\u201d ingredients, generally under two percent of the total formulation, that do not affect the character of the product. FSIS has never considered the meat or poultry components to be classified to be \u201cminor\u201d in this situation. 2. What are non-fluid seasonings? Non-fluid seasonings are dried spices, e.g., thyme and basil, dried flavorings from botanical sources, e.g., garlic powder and lemon powder, salt and sugar. Ingredients such as MSG, autolyzed yeast extract, hydrolyzed (source) proteins, and garlic have not been considered to be non-fluid seasonings. For example, whole garlic is a vegetable, not a spice, while garlic powder is a spice\u201d/seasoning. 3. If non-meat\u201d/non-poultry ingredients, such as irradiated spices, wheat flour, potatoes, and fruits, are added to an irradiated or non-

irradiated meat\poultry product, must the fact that they have been irradiated be disclosed in the ingredients statement? No. However we would permit this ingredient statement identification for irradiated non-meat and non-poultry components. 4. For the purposes of irradiation, are ingredients such as BHA, BHT, TBHQ permitted in sausage products that will be irradiated? At this time, no.","PACKAGING MATERIAL ISSUES 1. Do poultry products that are packaged and irradiated still need to be packaged in air permeable packaging materials? Yes, until FDA issues a final rule that no longer mandates the use of air permeable packaging materials for irradiated poultry products. However, poultry that is irradiated and packaged after irradiation is not required to be packaged in air permeable packaging materials. 2. If meat and poultry are packaged together and irradiated, would they need to be packaged in air permeable packaging materials? Yes. While red meat alone is not required to be packaged in air permeable packaging materials if packaged prior to irradiation, because that requirement still exists for poultry, a combination, e.g., beef roast and chicken breast packaged together prior to irradiation would have to be packaged in air permeable packaging materials. 3. Can meat irradiated with electron beam be packaged in the same packaging materials as meat irradiated by gamma ray? Yes. Recently, FDA provided approval on a trial basis (until February 22, 2001) to permit any of the materials currently approved under 21 CFR 179.45 to be used when pre-packaged meat food and poultry food products are treated with X-ray, electron beam and gamma ray irradiation under the following conditions: a. \u201cThe irradiation processor will comply with all general provisions for food irradiation listed in sections CFR 179.25 and 21 CFR 179.26(b); b. The machine sources of X-radiation and electron beams are used at dose levels not to exceed that specified in section 21 CFR 179.45 for packaging materials used, and at dose levels not to exceed those specified in 21 CFR 179.26(b) for the foods packaged; c. With the exception of the radiation source, as noted above, the packaging materials must comply with all other provisions of 9 CFR 179.45; and d. FSIS will monitor the participating establishments and immediately inform FDA of any unexpected findings.\u201d","PROCEDURAL ISSUES 1. Can hot-boned meat or poultry be irradiated? As of today, no. The regulation covers only refrigerated or frozen product. However, FSIS has petitioned FDA to allow the irradiation of hot-boned meat and poultry. 2. Will USDA accept imported meat and poultry products that have been irradiated in other countries into the US for distribution? Yes, provided they were treated and labeled consistent with USDA regulations. 3. If a company has its product irradiated, at another facility, must the HACCP plan at the producing establishment incorporate the irradiation step and CCP, or can there be two separate plans, i.e., one at the producing establishment and one at the irradiation establishment? FSIS considers any firm that irradiates meat food or poultry products to be an official establishment. Official establishments are required to irradiate meat food and poultry products only in accordance with HACCP systems. If an establishment contracts for its products to be irradiated for the purpose of reducing pathogens, we expect that establishment to have a CCP in its HACCP plan for irradiation, even though it does not conduct the irradiation in its own facility. Through review of receipts, certificates, and other records provided by the irradiator, the establishment would monitor and verify that its product was irradiated in accordance with its HACCP plan, contractual specifications, and the regulations. We also expect an establishments that has contracted out irradiation to address hazards it has identified to complete and sign its pre-shipment review only after verifying that its products have received the appropriate irradiation treatment by the contractor. 4. Can meat be irradiated more than

one time? Yes, but the total permitted absorbed dosage can not be exceeded. In these situations, it is the responsibility of the manufacturer to maintain records to document permissible limits are not exceeded.

5. What can be done with products that inadvertently receive too high an irradiation dosage? The products must be condemned as inedible and denatured."

"6. Are there special concerns with a fabricated multi-ingredient product, e.g., fresh sausage, made with only seasonings and irradiated beef, which is then packaged and irradiated? Yes. Total dosage of irradiation permitted for beef and other components, e.g., spices, could not be exceeded. Additional recordkeeping would probably be necessary to ensure that the maximum absorbed dosage is not exceeded."]}

{ "file\_name": "FSIS\_GD\_2010\_0002", "title": "Updated Questions and Answers Food Safety and Inspection Service (FSIS) Labeling Compliance Policy Guide on Poultry Food Product Dating", "num": "FSIS-GD-2010-0002", "id": "0ffb02f0a32a3e9202d3ebe0d595fbe3eebfd82efbf94d7103a629153e0a29c2", "corp\_us": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Labeling\_Guide\_on\_Poultry\_Food\_Dating.pdf", "type": "pdf", "n\_pages": 8, "word\_count": 3557, "text\_by\_page": [ "I. General Q. What is the new final rule that eliminated the standards of identity for pizza with meat or sausage products? A. The final rule published on July 31, 2003, in the Federal Register and was effective October 22, 2003. It eliminated the standards for pizza products, i.e., the standards in 9 CFR 319.600, which required a minimum meat content and required components of a traditional pizza. The standards were eliminated to allow for more innovation in pizza manufacturing. To inform consumers of the changes in pizza products, 9 CFR 317.8 (b)(40)and 381.129 (f) require a percentage statement regarding the meat/poultry component to be placed contiguous to the ingredients statement for a time period of approximately 3 years. II. Requirements for Labeling the Percentage of a Meat/Poultry Component on Pizza Products 1. Q. When is the percentage labeling no longer required? A. The percentage labeling requirement expires October 30, 2006. The date of October 24, 2006, placed in the \"Date\" section of the final rule in the July 31, 2003, Federal Register is an error in printing. 2. Q. Is there a minimum type size requirement for the percentage labeling of the meat/poultry component? A. No, however, consistent with rules on all required labeling features, the information must be prominent and conspicuous, e.g., navy blue print on a black background is not considered to be prominent and conspicuous. 3. Q. Can a company declare the exact percentage of the meat/poultry component on the label if the formula lists the amount to the hundredth or thousandth decimal place? A. We suggest the required percentage listing be limited to one place past the decimal point, e.g., 5.2% would be acceptable. 4. Q. Can the required percentage declaration of the meat/poultry component be rounded up to the nearest whole number or tenths? A. No, the percentage cannot be over-declared. Consistent with the Agency's current labeling policies, rounded numbers have to be rounded down, e.g., 5.26% could be rounded to "5%" or "5.2%." 5. Q. Can the required percentage declaration of the meat/poultry component be rounded up to the nearest whole number or tenths? A. No, the percentage cannot be over-declared. Consistent with the

Agency's current labeling policies, rounded numbers have to be rounded down, e.g., 5.26% could be rounded to "5%" or "5.2%. 6. Q. If the ingredients statement and signature line fill the space of the side panel on the product packaging, can the percent declaration of meat/poultry component be moved to the next panel to the right? A. No. The percentage is required to appear on the same panel, and contiguous to, the ingredients statement. It may appear above, below, or to the right or left of the ingredients statement. 7. Q. Can the percent declaration be placed contiguous to the ingredients statement by a means other than reprinting the label or using a pressure-sensitive sticker? A. Yes, the percentage information can be ink jetted on the label, hand stamped with indelible ink, or imprinted on the label, provided it is in the required location and is prominent and conspicuous. For Child Nutrition (CN)-labeled products, see the section entitled "Child Nutrition (CN)-Labeled Products." 8. Q. For a pizza topped with meat components, e.g., sausage and pepperoni, can the two meat percentages be combined and declared as a total meat percentage contiguous to the ingredients statement? A. The regulation states that pizza products that "list a meat component as part of the product name must bear a parenthetical statement contiguous to the ingredients statement that conveys the percent of the cooked, cured, or dried meat component." Thus, if two meat components are declared, e.g., sausage and pepperoni, in the product name, companies should list the percentage of each contiguous to the ingredients statement. However, the Agency will also view other percentage listings as being in compliance with the intent of the regulation. There is no objection to listing a combination of the labeled meat/poultry components, and the total percentage of meat/poultry food products or a declaration of the percentage of meat/poultry in the components, provided that the percentage of meat/poultry present in the finished meat/poultry," food products is known. Examples below show acceptable declarations based on meat/poultry components:

Percentage Of Ingredients In Product Formula Examples Of Acceptable Labeling Of Percentages To Meet Requirement In Final Rule

5% Pepperoni (60% pork, 20% beef) "5% Pepperoni, " 5% Meat food product, " "40% Meat, " "3% pork and 1% beef, " "4% Meat ingredients" 3% Sausage and 2% Pepperoni "3% Sausage and 2% Pepperoni" "Sausage and Pepperoni 5%" 10% Beef Patty Mix (8% Beef Sausage&133) "10% Beef Patty Mix, " "8% Sausage, " "8% Beef Sausage" 3% Bacon and 3% Chicken Sausage "3% Bacon and 3% Chicken Sausage, " "6% Bacon and Chicken sausage, " "6% Meat and poultry food product" 8% Turkey Sausage (50% Turkey) "8% Turkey Sausage, " "4% turkey, " "8% poultry food product, " "4% poultry ingredients" 4% Ham and Water Product "4% meat food product, " "4% Ham and Water Product" 6% Turkey Ham and Water product "6% Turkey Ham and Water Product" 5% Uncooked Sausage "5% Uncooked Sausage" 5% FatReduced Pepperoni "5% Fat-Reduced Pepperoni"

9. Q. If a product is named "Sausage Pizza" but the product is topped with 20% "meat pizza topping" (e.g., 12% sausage/8% textured soy protein), is it acceptable to declare the required meat content simply as "20% meat food product?" A. No, that name would be misleading since the implication would be that the product contained 20% sausage when in reality it contained only 12%. Accurate, non-misleading percentage declarations would include "12% sausage, " "12% meat food product, " and "X % meat, " if the actual percentage of meat in the pizza topping is known. The declaration of "20% Pizza Topping" would be acceptable because it is a name that conveys the presence of additives", "beyond the sausage portion in the meat food product.

10. Q. Can the amount of meat or poultry topping in the pizza be determined based on precooked

weight if the percentage statement is qualified, e.g., "15% beef (pre-cooked)"? A. No. The amount of meat or poultry must be determined according to the cooked, cured, or dry weight of the topping as a percentage of total weight according to the new final rule. III. Exhausting the Inventory of Existing Labels of Pizza Products 1. Q. What are the allowances for exhausting inventories of existing labels before the declaration of meat\poultry is needed? A. In order to use existing label inventory, the product would need to remain the same, i.e., a traditional pizza. There are three situations that apply: (1) The first is where there is no change to the product formulation, label, order of predominance of ingredients, and nutrition facts (outside of the 80\120 parameters) so no modification to the label is necessary. In this case, we are extending the effective date of the final rule to July 31, 2004, for the provision of adding the percentage of meat content to the labeling of existing pizza products, provided that the percentage declaration remains on each individual label for at least three years from the date of first use. (2) The second situation involves changes to the formulation and, therefore, to the label. However, in this case, the manufacturer decides to make the changes to the existing label by use of pressure sensitive stickers, ink jetting, indelible ink hand-stamps, etc. The product labeling qualifies for generic label approval under 9 CFR 317.5(b)(1) and 9 CFR 381.133(b)(1) which means that some changes may be made to the existing labeling under the generic provisions in 9 CFR 317.5(b) (9) or 381.133(b) (9), e.g., the order of predominance of the ingredients statement can be corrected by use of a pressure sensitive sticker covering the inaccurate information. The label would bear the percent declaration when the formula is changed to lower the amount of meat\poultry or meat food product or poultry product from that which was required in the traditional standardized pizzas. In all cases, the labeling must prominently bear all mandatory features and cannot be false or misleading in any manner. (3) The third situation involves changes to the formulation and label where a temporary approval is sought by the company, and it meets the conditions specified in 9 CFR 317.4(f) and 381.132(f).

2. Q. If the pizza formula remains the same, is the percentage of meat\poultry component required to be added to the existing labels for them to be used up? A. No, the existing labels can be used up without", "adding the percentage, provided that the formulation does not change. However, the percentage may be voluntarily added by a sticker to existing stock under the generic labeling provisions. (For Child Nutrition (CN) labeled products, see the section entitled "Child Nutrition Labeled Products.") 3. Q. If the supplier of a company\u00b4s pepperoni or crust makes minor changes to the formula of the purchased component, can the old labels continue to be used? A. The company would need to submit such labels to the Labeling and Consumer Protection Staff (LCPS) with a request for a temporary approval. The conditions for granting temporary approvals are listed on the website. Minor changes can be granted temporary approval, or the company can change the existing label by use of pressure sensitive stickers, ink jetting, indelible ink hand-stamps, etc. Such labeling qualifies for generic label approval ( 9 CFR 317.5(b)(1) and 9 CFR 381.133(b)(1)) and generic label modifications ( 9 CFR 317.5(b) (9) and 381.133(b) (9)). (See the answer to " 2 Q." above, in this section.) 4. Q. If a company wants to reduce the percentage of the meat\poultry component, can the old labels be used by adding a sticker declaring the percent of meat\poultry component without an LCPS temporary approval? A. Yes, but only when there are no other changes needed to the label, i.e., the order of predominance in the ingredients statement does not change, the nutrition information remains in compliance, and all other information on the label remains accurate. If

there are changes, e.g., order of predominance, the company would need to request a temporary approval that provides data on the nutrient profile of the revised formula to ensure that the nutrition facts information remain in compliance with the regulations. Temporary approvals will be permitted on a case-by-case basis. (For CN labeled products, see the section entitled "Child Nutrition Labeled Products.") IV. Generic Label Record (Final Labeling) 1. Q. If a company only adds a sticker that declares the percentage of the meat\poultry component to previously approved labeling, can the label be approved generically? A. Yes, provided there are no other deficiencies on the label (See answer to III. Q. 4 above). (For CN labeled products, see the section entitled "Child Nutrition Labeled Products.") 2. Q. If a company changes their existing formula, can label modifications be approved generically? A. No, since there is no longer a standard of identity for pizza with meat\sausage products, "such products are now classified as nonstandardized products or products guided by a common or usual name, "pizza." The first time new or modified labels for such products need to be approved, they must be sent to LCPS for approval. Further modifications to the LCPSapproved label may be handled generically if they fall under the generic labeling modifications in 9 CFR 317.5(b)(9) or 381.133(b)(9) of the regulations. V. Naming of "Traditional" and NonTraditional, Descriptively Labeled Pizza-Like Products 1. Q. For the purposes of this regulation, what is a traditional versus non-traditional pizza? A. A traditional pizza is a product formulated with the components that were stipulated in the regulatory standard that existed in 9 CFR 319.600, i.e., tomato sauce, cheese, and meat topping on a bread-based crust. A non-traditional pizza is a product missing one or more of these components, e.g., instead of tomato sauce, it may include a white sauce, and instead of a breadbased crust it may use a corn tortilla. 2. Q. If a company renames their pizza-like product with a descriptive name that does not include the term "pizza," do they need to include a percent declaration of the meat\poultry component? A. No, if the product is descriptively named, e.g., "sausage, cheese, and sauce on a crust," and the term "pizza" does not appear anywhere on the label (including the nutrition facts panel, heating instructions, and romance copy), percent declaration of the meat\poultry component is not required. 3. Q. Does the order of ingredients\components in the product name of descriptively labeled pizza-like products have to follow the order of ingredients in the product formula? A. No, the Agency does not require a specific order of predominance in the product name of descriptively labeled products. 4. Q. In naming traditional pizzas or nontraditional pizza-like products, if a company uses 1% Italian sausage, 1% pepperoni, and 1% bacon, can the product name list all three meat components individually or collectively as "meat?" A. Even though the three meat components are at levels of 1 percent, they can each be identified in the product name since they could each characterize the product. The general term "meat" could also be used in the name, e.g., "Meat Pizza," for the traditional pizza, and "Meat, Cheese, and Pesto Sauce on a Crust," for a non-traditional product. 5. Q. If a company formulates their product with, "a pizza topping that contains textured vegetable (source) protein (TVP), does the TVP need to be included in the product name? A. The final rule that eliminated the pizza with meat or sausage standards did not affect the Agency\u00b4s longstanding labeling policy on meat\poultry-to-TVP ratios which was created to ensure that meat and poultry products are identified in an accurate and non-misleading way. The meat\poultry-to-TVP ratios are applicable to the naming of all pizza products unless the pizza is formulated with a meat food or poultry product the policy for which provides for the use of TVP without product name implications, e.g.,

\"(species or kind) Patty\" or \"(species or kind) Pizza Topping.\" In the case of these two examples, TVP is an expected ingredient in such products. 6. Q. Is the requirement in 9 CFR 317.8(b) (27) and 381.120 for qualifying the presence of calcium propionate or sodium propionate in pizza crust in the product name still in effect? A. Yes. The final rule only eliminated the standards of identity for pizza with meat or sausage products; other prevailing regulations, e.g., those dealing with ingredients labeling, are not implicated. 7. Q. Is it acceptable for the pizza product name to list some \"characterizing\" components that are at or below two percent and not mention other ingredients that are at a higher level but still below the two percent or less characterizing amount? A. Yes, some components, e.g. anchovies, garlic, and jalapeno peppers, are used at levels that are well below two percent and low levels can significantly characterize a product to the extent that they are included in the product name. However, it is not necessary to list all other components that are at a higher level, but still below the two percent level, e.g., imitation cheese. 8. Q. What guidance exists for naming substitute cheese and real cheese on pizza-like products? A. Consistent with the final rule, which stated that ingredients above two percent are characterizing, non-standardized products, such as pizza products, that highlight \"cheese\" in the product name or on the principal display panel (PDP) must contain above two percent real cheese to be characterizing. In addition, imitation\\substitute\\fat-reduced cheese, when used above two percent, also would be included as part of the product name. For descriptively named pizza products, cheese and imitation\\substitute\\fat-reduced cheese at characterizing levels, i.e., above two percent, would be included as part of the product name. 9. Q. The preamble to the final rule stated that once the final rule became effective, other \"pizza\", \"products with standards specified in the Food Standards and Labeling Policy Book will no longer be subject to the requirements of 9 CFR section 319.600, including minimum meat requirements.\" Which entries will be removed from the Policy Book? A. Because the pizza product entries in the Policy Book, viz., \"Pizza with Meat,\" \"Pizza with Sausage,\" \"Pizza with Poultry,\" \"Pizza with Bacon,\" \"Pizza with Chili and Beans,\" \"Pizza with Meat Pattie Crumble,\" and \"Pizza, Combination or Deluxe,\" were interpretations of the now-deleted 9 CFR section 319.600, it would not make sense to apply them. They will be removed shortly. 10. Q. What is the status of the entries in the Policy Book that include \"pizza\" in the product description that were not based on the previous pizza with meat\\sausage standard? Will they be retained? A. At the present time, the Agency will retain the entries for products that include \"pizza\" that were not established as interpretations of the previous standard in 9 CFR section 319.600. These entries include: Pizza Burger Pizza, Chicago Style Pizza Dogs Pizza, Pan Style Pizza Pups Pizza Roll Pizza Sauce with Sausage Pizza Sausage Pizza, Sicilian Style Pizza Topping Mix White Pizza I. Child Nutrition (CN) - Labeled Products 1. Q. Can CN-labeled products (i.e., products bearing CN labeling features that are required by the Food and Nutrition Service, FNS) get temporary approval for formulation changes? A. Temporary approvals for minor changes not affecting crediting will be granted by FNS. 2. Q. Can formulation changes to CN-labeled products be handled by generic approval? A. No. All formulation changes to CN-labeled products must be resubmitted to FNS for approval 3. Q. Can pressure-sensitive stickers be used to correct CN-labeled products? A. No. Stickers cannot be used on CN-labeled products for final or temporary approval. 4. Q. Can CN-labeled products that do not meet CN requirements be given a temporary approval\", \"by FSIS? A. No. 5. Q. Can a label keep the same CN identification number if the declaration of the percent of

meat\meat food product in the product is added voluntarily or as required by FSIS? A. Generally, FNS requires a new CN identification number and approval for any changes to the product name. However, if there are no other changes to the label application, FNS will not object to the generic approval of the addition of the declaration of percent meat\meat food product. FNS requires one copy of the generically approved label, along with a statement that indicates what was changed, to be sent to USDA, FNS, 3101 Park Center Drive, Rm. 632, Alexandria, VA 22302 ("Attention CN Label Reviewer"). 6. Q. Will CN product labels with changes need to be resubmitted to FSIS, LCPS, for reapproval? A. The answer depends on the circumstances: Yes - for labels resubmitted for temporary approval Yes - for labels submitted with new CN ID numbers No - for labels resubmitted as required by FNS that can be generically approved by FSIS. In this situation, the FNS re-approval will retain the previous FSIS approval number. (It is the company \u00b4s responsibility to convey to FNS that the label change can be done generically for FSIS so that the label is not forwarded to FSIS after the FNS review.) 7. Q. How do I contact the FNS, CN labeling staff, if I have other questions? A. The FNS, CN labeling staff can be reached at 703-305-2609. I. Miscellaneous Issues 1. Q. How low can the level of meat\poultry be before the product is no longer amenable to U.S. Department of Agriculture (USDA) jurisdiction (i.e., to the FMIA or PPIA)? A. In general, foods containing less than 3 percent raw or less than 2 percent cooked livestock or poultry ingredients are not defined as meat food or poultry products and, thus, are under the jurisdiction of FDA. 2. Q. If a pizza-like product contains 1% cooked meat sausage and 1% cooked poultry meat, is the", "product amenable? A. Yes. The product would bear the inspection legend of the meat or poultry component that is listed first in the product name."]}, {"file\_name": "FSIS\_GD\_2010\_0004", "title": "FSIS Guidance for Test Kit Manufacturers, Laboratories: Evaluating the Performance of Pathogen Test Kit Methods", "num": "FSIS-GD-2010-0004", "id": "2b46dc35a86dafc46d2f10aa6e9d2db235d8ae5b0f321d2664c57842fbff47eb", "corp\_us": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Validation\_Studies\_Pathogen\_Detection\_Methods.pdf", "type": "pdf", "n\_pages": 22, "word\_count": 6875, "text\_by\_page": ["Supplemental Pizza Q's & A's to Address the Names of Non-Traditional Pizza-Like Products and Pizzas with Modified Cheeses Supplemental Pizza Q's & A's to Address the Names of Non-Traditional Pizza-Like Products and Pizzas with Modified Cheeses New Questions\Answers: Naming Non-Traditional Pizza-Like Products In the absence of a pizza with meat standard, the prevailing regulations on naming meat and poultry products apply. According to the regulations (9 CFR 317.2(c)(1) and 381.117(a)), when a product's name is not guided by a standard of identity, products are named using a recognized common or usual name, if one exists, or a descriptive naming approach. After further consideration, the Agency has determined that a modification to the naming convention for certain nontraditional pizza-like products is needed. This modification relates to the continued use of the \"common or usual\" naming conventions of traditional pizza products. A question has also been added to clarify naming conventions with respect to the use of modified versions of standardized cheese products. 1. Q. What naming approach is acceptable for nontraditional pizza-like products that consist of the four traditional components (i.e., bread-base component used as a crust, shell, or other similar way; tomato sauce; cheese; and meat\poultry component) and only differ in their \"form\" from a traditional pizza, e.g., rolled, filled, or stuffed in a crust or breading, and fried

or baked? A. Such products could be named with the common or usual \"traditional\" pizza name; however, the basic nature or characteristics would also need to be identified, e.g., how the \"form\" of the product differs from the traditional pizza product. Examples would be \"pepperoni pizza in rolled dough and fried,\" \"sausage pizza enclosed in crust,\" \"Combination pepperoni and sausage pizza folded and sealed,\" and \"chicken pizza wrapped in a dough pocket.\" The term \"sandwich\" is not sufficiently descriptive for the form of the product because an enrobed or formed pizza is not defined as a traditional sandwich.

2. Q. Do imitation\\substitute cheese and modified versions of standardized cheese (per 21 CFR 130.10) need to be included in the product name on the labeling of traditional pizzas and non-traditional pizza-like products that consist of the four traditional components (i.e., bread-base component, tomato sauce, cheese, and meat\\poultry component) and only differ in their \"form\" from a traditional pizza? A. All of the traditional components of a traditional pizza that are present at 2 percent or more of the formulation do not need to appear in the common or usual product name. However, when \"cheese\" is included in the product name, or when a descriptive name is used that includes all the components that are present at 2 percent or more of the formulation, the amount of real cheese must be equal to or greater than\", \"that of the imitation, substitute, or modified versions of standardized cheese in the product or the imitation\\substitute\\modified cheese must be included in the product name. For example, a product identified as a \"Bacon, Cheddar Cheese, Hickory Flavored Sauce, and Sourdough Pizza,\" that contains 15 percent Cheddar and Reduced Fat Mozzarella Cheese would be expected to contain Cheddar at greater than 7.5 percent of the product formulation. Otherwise, the reduced fat cheese would need to be declared as part of the product name.

3. Q. Can a traditional pizza contain only a modified version of the standardized cheese for the required cheese component, or will this make the pizza a \"nontraditional\" pizza-like product requiring a descriptive name? A. Yes, a traditional pizza can contain only a modified cheese. Modified versions of standardized cheeses are actually covered by a \"general standard of identity\" in 21 CFR 130.10. In order for such products to contain novel ingredients, they must be identified with the standardized name in addition to a nutrient content claim. Thus, a pizza with a modified cheese would be regarded as a traditional pizza. However, the product name or other label features (e.g., starbursts) could not simply state the term \"cheese\" because of the nature of the modified standardized cheese and its required special labeling. Any statements regarding cheese would need to use the correct name of the component consistent with 21 CFR 130.10, e.g., \"fat free mozzarella cheese\" and \"reduced fat cheddar cheese.\" Revised Question\\Answer to Address Modified Versions of Standardized Cheese: Section V. Naming of \"Traditional\" and NonTraditional, Descriptively Labeled Pizza-Like Products

8. Q. When should real cheese and imitation\\substitute and modified versions of standardized cheese be declared on non-traditional, pizza-like products? A. The final rule stated that ingredients above two percent are characterizing ingredients. Consistent with the final rule, non-standardized products, including non-traditional pizza-like products, that highlight \"cheese\" or an imitation\\substitute\\modified cheese in the product name or on the principal display panel (PDP) must contain more than two percent real cheese for that cheese ingredient to be a characterizing ingredient. For descriptively named pizza products, cheese and imitation\\substitute\\modified versions of standardized cheese used at characterizing levels, i.e., above two percent, would be reflected as part of the product name. (Guidance on the

common or usual names of cheese products is found in FDA standards of identity regulations (21 CFR \u00a7 130.10 and Part 133).")],{"file\_name":"FSIS\_GD\_2009\_0001","title":"Import Permit Guide for Products with Small Amounts of Meat and Poultry","num":"FSIS-GD-2009-0001","id":"4d54f49dfb78074591e8bd65132b76d1dc59807f7ffaa320cdeb27ac71caa3af","corp\_us":"fsis\_guidelines","source\_page\_url":"https://www.fsis.usda.gov/policy/fsis-guidelines","url":"https://www.fsis.usda.gov/sites/default/files/import/Import\_Permit\_Guide.pdf","type":"pdf","n\_pages":40,"word\_count":5585,"text\_by\_page":["COMPLIANCE GUIDELINES FOR ESTABLISHMENTS ON THE FSIS MICROBIOLOGICAL TESTING PROGRAM AND OTHER VERIFICATION ACTIVITIES FOR ESCHERICHIA COLI O157:H7 April 13, 2004 TABLE OF CONTENTS I. Risk-Based Verification Sampling The revised FSIS Directive 10,010.1, entitled \u2018Microbiological Testing Program and Other Verification Activities for Escherichia coli O157:H7 in Raw Ground Beef Products and Raw Ground Beef and Beef Patty Components\u2019 includes instructions to FSIS inspection personnel and other program investigators on sampling and other verification activities for Escherichia coli O157:H7 (E. coli O157:H7) in raw beef products. All official establishments producing raw ground beef products, raw ground beef components, or raw beef patty components may be sampled. In 1994, FSIS declared all raw ground beef contaminated with E. coli O157:H7 to be adulterated unless it is further processed to destroy the pathogen. In the January 19, 1999 Notice (64 FR 2803), FSIS stated that intact cuts of beef that are to be further processed into non-intact cuts prior to distribution for consumption must be treated in the same manner as non-intact cuts of beef, because pathogens may be introduced below the surface of these products when they are processed into non-intact products. Non-intact raw beef products are ground or chopped beef, or beef that has been injected with solutions, or mechanically tenderized by needling, cubing, Frenching, or pounding devices, or reconstructed into formed entrees. Examples of non-intact raw beef products include beef that has proteolytic enzymes applied to or injected for tenderizing, beef that has been scored to incorporate a marinade, or formed and shaped products such as gyros. The following products are adulterated if contaminated with E. coli O157:H7 unless further processed to destroy the pathogen: 1) non-intact raw beef products and 2) intact raw beef products that are intended to be processed into non-intact products such as manufacturing trimmings (e.g., pieces of meat remaining after steaks, roasts, and other intact cuts are removed). FSIS has been collecting samples of raw ground beef products from establishments for E. coli O157:H7 testing to verify establishment control of the pathogen. In the revised Directive 10,010.1, FSIS may also sample raw ground beef components and raw ground beef patty components, which are source materials for raw ground beef and other nonintact raw beef products. FSIS will collect raw

ground beef products from grinding establishments, and may collect raw ground beef components and raw beef patty components from establishments that supplied source materials implicated in FSIS collected raw ground samples that tested positive for E. coli O157:H7. Retail facilities and import establishments producing raw ground beef products will also be sampled by FSIS. Raw ground beef components include raw esophagus (weasand) meat, head meat, and cheek meat; beef manufacturing trimmings (e.g., 90\10, 85\15, 75\25, 65\35, 50\50); boneless beef; beef from AMR systems; and lean finely textured beef (LFTB). Raw beef patty components include all products listed above in raw ground beef components; as well as partially defatted chopped beef (PDCB); finely textured PDCB; heart; and partially defatted beef fatty tissue (PDBFT). 2", "FSIS intends to develop a risk-based verification sampling program for raw ground beef products. Sampling is expected to be based on factors that may influence prevalence of and exposure to E. coli O157:H7, such as the volume of production of raw ground beef products, season of the year, and the number of suppliers for an establishment. The FSIS risk assessment on E. coli O157:H7 has determined that volume of production is a better determinant of the risk of E. coli O157:H7 than size of the establishment. It also determined that the prevalence of E. coli O157:H7 in cattle, and the incidence of foodborne illness and of products positive for E. coli O157:H7 are higher during the warmer months. Therefore, an establishment producing a large volume of ground beef products will likely be sampled more frequently than an establishment producing a lower volume of raw ground beef products. Likewise, FSIS will sample more frequently and with a higher number of samples during the high prevalence season. An establishment that has designed and implemented sampling plan and verification testing with a high degree of confidence of finding the pathogen in both the trim and finished ground product presents a lower risk of producing an adulterated product, and therefore will be sampled less frequently than other establishments. FSIS may also sample establishments that form ground beef patties but do not grind product. Establishments should have already reassessed their HACCP plans to comply with the FSIS Notice (October 7, 2002) requiring establishments that had not already reassessed their HACCP plans for raw beef products to do so in order to determine whether E. coli O157:H7 contamination was reasonably likely to occur in their production process for raw beef products. The Notice also stated that establishments receiving product for grinding should address E. coli O157:H7. Establishments that slaughter, fabricate and grind could employ control methods in their food safety systems, i.e., HACCP plans Sanitation SOPs or prerequisite programs to address the pathogen. Some control methods that can be included are the following: \u2022 Use of intervention treatments validated to control E. coli O157:H7 \u2022 Use of purchase specifications restricting source materials to those that have undergone validated intervention treatment \u2022 Use of source materials that have been rigorously tested for E. coli O157:H7 to verify that process controls to produce source material were effective \u2022 Use of less risky source material, such as use of beef manufacturing trimmings only \u2022 Use of more rigorous sanitation program \u2022 Verification testing that control programs are effective These control methods are discussed in the \u201cGuidance for Minimizing the Risk of Escherichia coli O157:H7 and Salmonella in Beef Slaughter Operations\u201d and the \u201cGuidance for Beef Grinders and Suppliers of Boneless Beef and Trim Products- Guide for Minimizing Impact Associated with Food Safety Hazards in Raw Ground Meat and Other FSIS Regulated Products\u201d found on the FSIS website:

[www.fsis.usda.gov\OPPDE\rdad\FRPubs\docs\\_00-022N.htm](http://www.fsis.usda.gov/OPPDE/rdad/FRPubs/docs_00-022N.htm) Another guidance document that would be useful for slaughter, fabrication and grinding establishments is the BIFSCO Best Practices. Best Practices offer guidelines for processing and handling 3", "of raw ground beef products as well as slaughter and fabrication safety measures. The document can be found at [http:\www.bifasco.org\BestPractices.htm](http://www.bifasco.org/BestPractices.htm)

II. Sample Collection of Raw Ground Beef Products

FSIS will routinely collect samples of the following raw ground beef products: \u2022 Raw ground beef products which include raw ground or chopped beef, hamburger, ground or chopped veal, veal or beef patties, beef patty mix, or raw ground beef product containing any amount of beef product derived from advanced meat recovery (AMR) systems. FSIS will collect samples of the following raw beef products generally as a result of a supplier producing or shipping raw ground beef components that, once ground and made into ground beef, tested positive for E. coli O157:H7: \u2022 Beef manufacturing trim, including raw product consisting only of beef from AMR systems \u2022 Beef carcasses FSIS will not be collecting samples of the following products: \u2022 Ground or chopped products made from both beef and other meat or poultry products, such as a ground beef and pork product \u2022 Beef sausage products FSIS will be notifying establishment management before collecting samples in order to provide enough time for the establishment to hold the lot to be sampled. The establishment will also be informed of the reason for collecting samples. Establishments may be sampled for any of the following reasons: 1) routine FSIS verification testing; 2) follow-up sampling in response to an E. coli O157:H7 positive; 3) traceback sampling; 4) follow-up sampling in response to an E. coli O157:H7 outbreak of foodborne illness. FSIS will typically be collecting one sample per lot. However, more than one sample could be collected if FSIS has a reason to believe that the product is at high risk of being contaminated with E. coli O157:H7 because of : \u2022 illness or outbreaks that may have been associated with the establishment, or \u2022 the establishment or its suppliers have previously produced product that tested positive in FSIS verification samples for E. coli O157:H7. Samples for the current day\u2019s production will be collected in their final packaged form and will be shipped after the establishment has completed its pre-shipment review.

4", "III. Sampled Lot

The establishment defines the sampled lot for raw ground beef products. The establishment should have a scientific or other supportable basis for defining the sampled lot. The establishment could consider factors, such as the following, in defining the sampled lot: \u2022 the establishment\u2019s definition of a lot included in its E. coli O157:H7 sampling plan (if applicable); \u2022 the establishment\u2019s history of setting lot size; \u2022 product coding ; \u2022 how products are intermingled or queued during processing and packaging; \u2022 if the same equipment was used for all the products; \u2022 process control performance including those for other pathogens; \u2022 establishment HACCP plan monitoring and verification activities; \u2022 sanitation SOP records; and \u2022 types of raw beef components used. Establishments that test for E. coli O157:H7 usually have a sampling plan. A sampling plan would include the definition of what the sample represents, i.e., the sampled lot, whether a single combo, 5 combos or an entire trailer load. It would also include the number of samples to be collected and whether testing is to be done in-plant or by an external laboratory. The sampling plan would include a written protocol for sample collection, procedures for microbial analysis and reporting results, and action to be taken in the event of a positive result. FSIS will recognize the establishment\u2019s definition of the sampled lot, provided the establishment has a supportable basis for defining the sampled lot.

However, FSIS cautions that the defined lot size does not relieve an establishment from its responsibility to consider whether there are connections between lots. Possible scenarios: \u2022 If multiple lots of beef trim were produced from source materials from the same production lot of a single supplier, and some of this product were found positive for E. coli O157:H7, FSIS would expect the establishment to have a supportable basis that justifies why any other trim produced from those source materials should not be considered to be adulterated. \u2022 A grinding establishment must have supporting documentation that a lot is not adulterated with E. coli O157:H7 if the lot comes from the same source material in which the other lots produced were found contaminated with E. coli O157:H7. \u2022 If the establishment mixes raw materials from different suppliers and one supplier\u2019s raw material was found positive for E. coli O157:H7, FSIS would expect the establishment to have a supportable basis that justifies why any product from these source materials should not be considered to be adulterated. It should be noted that if an establishment has a validated control system and verifies throughout each shift by sampling and testing, that specific lots of product are negative for E. coli O157:H7, this information could possibly be a basis for determining that one E. coli O157:H7-positive lot does not implicate other lots produced on the same day. 5", "In situations where recall, detention or seizure is necessary, more product than the product from clean-up to clean-up under the HACCP plan may be represented by the sample. More product than the establishment\u2019s definition of a sampled lot, or all products produced from the same source materials may be determined as representing the sample. An establishment\u2019s detailed production records will help the establishment in establishing the product that is represented by the sample. Records that are useful in tracebacks (i.e., tracing back the source of contamination) would include grinding logs showing the times of each grind, the formulation or blend of raw ingredients together with amounts used, and supplier lot identification numbers and results of any tests conducted on the raw materials or finished products. The \u201cProduct Recall Guidelines for Firms\u201d, which is an attachment for FSIS Directive 8080.1 includes some examples of how records will help in defining the lots that are affected by a sample testing positive for E. coli O157:H7. This document will be posted on the FSIS web site. It is recommended that the establishment consider staging the production of raw ground beef in a manner such that this product is handled prior to the production of raw beef product in which the equipment or source materials not specifically controlled to prevent, eliminate, or reduce the level or presence of E. coli O157:H7 are handled. This process would involve handling the least risky product prior to the more risky product. Below is a list of products believed to be ranked from the least risky product to the more risky product: 1) Source materials that have undergone intervention treatments during slaughter and fabrication that are validated to eliminate or reduce E. coli O157:H7 to nondetectable level, and statistically-based verification testing of the lot resulted in a negative test for the pathogen. 2) Source materials that have undergone validated intervention treatments, but not verified as testing negative for E. coli O157:H7. 3) Source materials that were verified as testing negative for E. coli O157:H7 but have not undergone validated intervention treatments. 4) Source materials that have not undergone validated intervention treatments, nor verification testing for E. coli O157:H7. For any of the four categories of source materials mentioned above, the different kinds of source materials could also be queued from lowest to the highest risk product in the following order: a) Source

materials that are intact products intended for non-intact product b) Source materials that are from only one supplier source c) Source materials that include AMR products, raw esophagus (weasand) meat, head meat, cheek meat, and diaphragm (skirt) meat, lean finely textured beef (LFTB), partially defatted chopped beef finely textured (PDCBFT) or partially defatted beef fatty tissue (PDBFT). d) Rework products 6", "IV. FSIS-Collected Sample That Tests Positive for E. coli O157:H7 FSIS laboratories will screen samples for the presence of E. coli O157:H7 and confirm any presumptive positive samples. The Agency notifies the establishment if a sample collected by FSIS is presumptive positive or confirmed positive for E. coli O157:H7. A test is considered presumptive positive when analytical steps of microbiological analysis indicate the strong possibility that E. coli O157:H7 is present, but additional steps are needed to confirm the presence or absence of the organism. Rapid screening methods can be used to detect the pathogen as presumptive positive, but additional steps are needed to confirm its presence or absence. The test is confirmed positive when biochemical, serological and \or genetic testing result in a finding of E. coli Serotype O157:H7, O157:H7:NM (non-motile), or O157:H7indeterminate. A sample is confirmed to contain the bacterial isolate of E. coli O157:H7 through testing conducted by either FSIS or non-FSIS laboratories. Establishments should have information on the suppliers of source materials because this information will be needed if a sample tests positive for E. coli O157:H7. The information provided by the establishment will help in tracing the source of contamination. FSIS will be asking for the following information: 1) Name and phone number of the supplying establishment and point of contact (name, title, e-mail address and fax number) 2) Supplier lot number 3) Production date If the source materials for the sampled raw ground beef products are from a foreign establishment, the following information will be needed: 1) Country of origin 2) Foreign establishment number 3) Shipping mark 4) Import house 5) Barcodes or any other information that identifies the origin of the product When a sample collected by FSIS is found positive for E. coli O157:H7 the sampled lot is adulterated. The establishment should have records on file to determine the lots implicated by the positive sample. FSIS will determine if the affected product lots will be retained, detained or recalled. Establishments should take the following actions if a sample collected by FSIS tests positive for E. coli O157:H7: 1) An establishment must ensure proper disposition of affected products. All affected product lots must be further processed to destroy the pathogen (e.g. 7", "cooking, irradiation), or the product could be destroyed. This could be done onsite or at another inspected establishment, renderer, or landfill. Disposition of the product must be documented (Procedures for documenting transfer and disposition of positive products are discussed in Section VII). 2) An establishment that has one or more validated CCPs for E. coli O157:H7 should take corrective actions in accordance with 9 CFR 417.3 (a). 3) An establishment that does not have one or more validated CCPs for E. coli O157:H7 should take corrective actions according to 9 CFR 417.3 (b). 4) An establishment that has purchase specifications addressing E. coli O157:H7 in their prerequisite programs and do not address E. coli O157:H7 in its HACCP plan should take corrective actions according to 9 CFR 417.3 (b) and, if the establishment addresses E. coli O157:H7 in its Sanitation SOP, 9 CFR 416.15. V. Establishment Testing of Product for E. coli O157:H7 Some establishments test their finished products for E. coli O157:H7 to verify that their control methods are effective and that their products are not adulterated. Establishments testing their finished products should use FSIS testing methods, or methods that are equal to or better in sensitivity. FSIS testing methods can

be found on the FSIS website: [www.fsis.usda.gov\OPHS\microlab\mlgbook.htm](http://www.fsis.usda.gov/OPHS/microlab/mlgbook.htm) Following are the criteria for a testing method to be considered or accepted as equivalent to the FSIS method: \u2022 The sample test portion (analytical unit) must equal at least 325 grams, analyzed as individual sub-samples having a maximum weight of 75 grams. \u2022 Evidence must be provided that demonstrates the method is equal to or greater in sensitivity than the current FSIS method. [Notes: (a) The current FSIS E. coli O157:H7 method employs an immunomagnetic separation (IMS)-based technique for cultural confirmation of screen-positive test results which has significantly increased the sensitivity of the method. (b) In lieu of cultural confirmation methods, reliance on positive results from screen tests approved by AOAC International or other internationally recognized scientific organizations could be deemed equivalent to the FSIS method.] When an establishment tests its own finished product for E. coli O157:H7 for verification purposes, pre-shipment review will not fulfill its purpose unless the results of the tests are known. However, while the establishment is awaiting test results, it may move product to different locations. In this case, FSIS is providing establishments the flexibility to move product prior to conducting pre-shipment review as long as the establishment maintains control of the product. The establishment has to maintain control of the product, so that in case the samples test positive for E. coli O157:H7, the establishment can conduct procedures for proper disposition of the product. This allows an establishment to conduct pre-shipment review even if the product is at a location or at locations other than the producing establishment, provided the producing establishment maintains control of the product. FSIS should have access to results of any testing and any monitoring activities performed by the establishment which may have an impact on the hazard analysis. If the establishment moves product before test results become available and the lot tests presumptive positive or positive, the establishment should complete pre-shipment review only after it has records showing that the product received proper disposition. When establishment testing finds the product to be positive for E. coli O157:H7, the sampled lot is considered adulterated. If the product is found presumptive positive and the establishment does not test to confirm the presence or absence of the pathogen, the sampled lot is not eligible to bear the mark of inspection. Thus, the establishment must take corrective actions and ensure appropriate disposition of the product. The establishment may further process the product from the sampled lot on-site or transport the product to another official establishment or to renderers or landfills for further processing to destroy the pathogen or for destruction. FSIS will review the records associated with the testing conducted by the establishment or FSIS and verify if the establishment implemented corrective actions and ensured proper disposition of the positive products.

**VI. Transfer of Products That Test Presumptive Positive or Positive for E. coli O157:H7**

**A. Producing or Shipping Establishments**

Establishments should provide for the disposition of products that tested presumptive positive or positive for E. coli O157:H7. As mentioned above, establishments may further process the product from the sampled lot on-site or transport the product to another official establishment for further processing to destroy the pathogen, or establishments may move such product to a renderer or landfill. Any movement of products that tested presumptive positive or positive for E. coli O157:H7 should be under documented company control (such as company seals) to safeguard the products. If such product is going to another official establishment, it may also move under FSIS control (e.g., under USDA seal or accompanied by FSIS form 7350-1). Establishments that produced products that are

presumptive positive or positive should obtain documentation evidencing proper disposition from the official establishment, renderer, or landfill where disposition will occur. A producing establishment that transports presumptive positive or positive product or product for which results are pending should maintain the following: 1) Records identifying the official establishment, renderer, or landfill operation that received presumptive positive or positive product; 2) Records identifying the official establishment that is to receive the product for which results are pending; 3) Control of product destined for a landfill operation or renderer while the product is in transit (e.g., through company seals); 9", "4) Control of product destined for an official establishment while the product is in transit (e.g., through company seals) or ensures the product moved under FSIS control (e.g., under USDA seal or accompanied by FSIS form 7350-1); 5) Records showing that the presumptive positive or positive product, including product that was moved pending test results, received proper disposition, including documentation from the official establishment, renderer or landfill operation where disposition occurred, showing that the product received proper disposition. The producing establishment should complete pre-shipment review (of corrective action records) for product from a lot that tested presumptive positive or positive only after it has the records described in paragraph #5 above for that particular product.

B. Receiving Establishments An establishment receiving E. coli O157:H7 presumptive positive or positive product for further processing should document the following: 1) Receipt of the presumptive positive or positive product; 2) That the receiving establishment maintains control of the product; 3) E. coli O157:H7 is addressed in the establishment\u2019s hazard analysis and HACCP plan. . Presumptive positive or positive products can be further processed to destroy the pathogen by lethality treatments, e.g. cooking, irradiating. FSIS will verify these processes and the resulting documentation. The documentation of the lethality treatment should be sent to the producing establishment. A receiving establishment that is producing ready-to-eat and irradiated products and also not ready-to eat products and not irradiated products should segregate product from a sampled lot that is presumptive positive or positive for E. coli O157:H7 from those that are not to be further processed to destroy the pathogen.

VII. Use of Instructional or Disclaimer Statements

Concerning E. coli O157:H7 An instructional statement concerning E. coli O157:H7 is a statement that addresses how the product should be prepared or handled to ensure that the pathogen is eliminated or reduced to an undetectable level. Examples of instructional statements concerning E. coli O157:H7 in raw ground beef components, raw beef patty components, and ground beef products may include, \u201cfor full lethality treatment\u201d or \u201cfor cooking only.\u201d A disclaimer statement concerning E. coli O157:H7 is a statement regarding the type of controls or verification activities addressing the pathogen that were NOT used in the production of the product. An example of a disclaimer statement concerning E. coli O157:H7 is, \u201cproduct has not been tested for E. coli O157:H7\u201d.

Establishments are not required to include instructional or disclaimer statements concerning E. coli O157:H7 on labels of raw ground beef products, raw ground beef components, or raw beef patty 10", "components; however, some establishments may choose to include such statements on the labels of these products.

A. Establishments that Place Instructional or Disclaimer Statements on Their Product Label To use labels on raw ground beef products, raw ground beef components, or raw beef patty components that include an instructional or disclaimer statement concerning E. coli O157:H7, establishments must obtain sketch approval from FSIS

Labeling and Consumer Protection Staff and maintain a sketch approval in the company's required labeling records (see 9 CFR 317.4(a)). The labeling of ground beef products, single-ingredient raw ground beef components, or single-ingredient raw beef patty components that include special instructions or disclaimer statements concerning E. coli O157:H7 cannot be generically approved because FSIS considers these special instructions or disclaimers to be special claims (see 9 CFR 317.5(b)(2)). Labeling products with instructional (e.g., "for cooking only") or disclaimer statements (e.g., "not tested for E. coli O157:H7") is not a means to control pathogens. These statements should not be used to justify a determination that E. coli O157:H7 is not a hazard reasonably likely to occur in their production of raw ground beef products, raw ground beef components, or raw beef patty components. Therefore, such statements cannot be used as a CCP or intervention for E. coli O157:H7. If an establishment has determined that E. coli O157:H7 is a hazard reasonably likely to occur in its production of ground beef products, raw ground beef components, or raw beef patty components, the establishment must have an intervention to address the hazard, and NOT use labels that include disclaimer or instructional statements on these products as a means of addressing the hazard presented by E. coli O157:H7. An establishment may use a disclaimer statement, such as, "not tested for E. coli O157:H7" on labels of ground beef products, raw ground beef components, or raw beef patty components only if it has a validated intervention for the pathogen in its HACCP plan for these products. A disclaimer that the product has not been tested for E. coli O157:H7 implies that E. coli O157:H7 may be a food safety hazard reasonably likely to occur in the product in the absence of controls. Therefore, the information contained in the disclaimer statement would be inconsistent with a determination in the hazard analysis that it is unnecessary to address this hazard in the HACCP plan and the HACCP plan may be determined inadequate. The placement of any instructional statement addressing E. coli O157:H7 on labels of raw ground beef products, raw ground beef components, or raw beef patty components must be reflected in an establishment's decision-making documents (9 CFR 417.5(a)(2)), and hazard analysis, (9 CFR 417.2(a)(1)). For example, if an establishment places the statement "for cooking only" or "for full lethality treatment" on raw ground beef products, raw ground beef components, or raw beef patty components, the establishment's hazard analysis should show how the establishment is ensuring that the product will go for cooking only, or for other full lethality treatment only. If the establishment places a "for cooking only" statement on the product and cooks the product in the establishment, the establishment's flow chart should show the cooking steps the product will undergo. If the establishment places a "for cooking only" statement on the product and ships it to outside establishments, the shipping establishment should have controls in place to ensure that the product goes only to establishments that cook it. If the shipping establishment also produces product that is not intended for cooking, it should have controls in place to segregate product intended for cooking from product not intended for cooking. If an establishment places the statement "for cooking only" on its finished product, but the establishment has not addressed the intended use of its finished product in its decision-making documents or hazard analysis, the establishment's hazard analysis and decision-making documents would not be consistent with the information contained in the instructional statement. Note: Product labeled "for cooking only" may go to an establishment that cooks product intended for additional

further processing. As long as the cooking establishment cooks the product at a sufficient temperature and for a sufficient period of time to eliminate or reduce E. coli O157:H7 to an undetectable level, the cooking establishment would be complying with the labeling instructions.

B. Establishments Receiving Products with Instructional or Disclaimer Statements on the Label

Establishments receiving raw ground beef products, raw ground beef components, or raw beef patty components with a label that includes an instructional statement meant to address E. coli O157:H7 (e.g., "for cooking only" or "full lethality treatment") or disclaimer statements should:

- 1) address the use of the incoming product with disclaimer statements in their HACCP plan as if the product may be contaminated with E. coli O157:H7; and
- 2) follow the instructional statements on incoming product. For example, if the establishment receives ground beef products, raw ground beef components, or raw beef patty components that bear the instructional statement, "for cooking only," the establishment should cook the product so that the product receives an adequate lethality treatment.

Note: An establishment that receives product labeled "for cooking only" may cook product that is intended for additional further processing. Even if the product will undergo further treatment before it is fully processed, as long as the establishment cooks the product at a sufficient temperature and for a sufficient period of time to eliminate or reduce E. coli O157:H7 to an undetectable level, the cooking establishment would be complying with the labeling instructions.

VIII. Purchase Specifications

One of the methods that establishments producing raw ground beef product can use to control E. coli O157:H7 in ground beef is the use of purchase specifications to ensure 12", "receipt of source materials that have undergone interventions that eliminate or reduce E. coli O157:H7 to an undetectable level. The Agency has determined that beef grinders can include purchase specifications addressing E. coli O157:H7 in their HACCP plan, or their Sanitation SOP, or other prerequisite programs. An establishment that decides that E. coli O157:H7 is not a hazard reasonably likely to occur due to the presence of purchase specifications included in its Sanitation SOPs or its prerequisite program should include information on its relevant prerequisite programs in its supporting documentation (417.5(a)(1)). The hazard analysis should include scientific support and the decision-making documents associated with the development and use of this program in order to support through recordkeeping requirements (Section 417.5(a)(2)) that this pathogen continues to be a hazard not reasonably likely to occur because of the established program. The establishment should be able to demonstrate that the design and execution of its purchase specification program ensures that the pathogen is not likely to occur in its production process as a direct result of this prerequisite program. The establishment with purchase specifications should require documentation from the suppliers accompanying the product showing that the purchase specifications are being met. The receiving establishment should verify that the purchase specifications are being met at some frequency. There should be a process whereby the supplier notifies the establishment when the supplier determines that its interventions have been ineffective or not appropriately applied, and for the receiving establishment to verify that the supplier is regularly meeting the receiving establishment's specifications. This documentation and other verification activities are necessary to ensure that the food safety hazard is not reasonably likely to occur, and for the establishment to determine that it will not have to develop a CCP in the HACCP plan. A grinding establishment that has a purchase specification program and is receiving source materials for grinding from an establishment that

is utilizing a validated pathogen reduction intervention on beef carcasses and routinely verifying the intervention through E. coli O157:H7 testing should receive documentation from the supplier stating that a validated intervention is being used, and that the intervention is operating effectively as shown by negative tests for the pathogen during verification testing. The document should also specify the interventions of the supplying establishment. The documentation should accompany each shipment. A single annual letter from a supplier stating that it has interventions in place or just sending photocopies of the same information with each shipment of product is not enough supporting documentation to provide for good decision-making to support that this food safety hazard is not likely to occur. Adequate documentation would provide information to the receiving establishment concerning the control of this pathogen at the establishment supplying the product on an ongoing basis. The documentation should show that the interventions were operating effectively. Establishments with purchase specifications that are receiving source materials for grinding should find out what the supplying establishments are doing to prevent, eliminate or reduce E. coli O157:H7 to undetectable levels. They should find out whether the supplying establishments have CCPs addressing E. coli O157:H7, and if they conduct 13", "verification testing for the pathogen. If an establishment has purchase specifications addressing E. coli O157:H7 in its prerequisite program and has determined that E. coli O157:H7 is not a hazard reasonably likely to occur in its production because of the purchase specifications, the establishment should have supporting documentation showing that its suppliers have CCPs addressing E. coli O157:H7. If a grinder has incorporated purchase specifications addressing E. coli O157:H7 as a CCP at receiving, and upon verification testing finds that product received under purchase specifications is positive for E. coli O157:H7, the grinder should conduct corrective actions specific to this CCP. Examples of corrective actions include among others, no longer buying from that supplier, or contacting the supplier so that the supplier could determine what controls may have failed. If the supplier makes any appropriate changes to its controls or interventions so that the supplier could certify that it had effectively eliminated any E. coli O157:H7, the grinder could continue purchasing from that supplier. FSIS recommends that establishments that have purchase specifications to prevent E. coli O157:H7 from entering the facility include testing for E. coli O157:H7 as part of their verification activities (67 FR 62331). In addition, given the nature of E. coli O157:H7, FSIS recommends that receiving establishments that have purchase specifications addressing E. coli O157:H7 determine whether CCPs preventing E. coli O157:H7 growth or contamination after product receipt are necessary (67 FR 62330). Whether letters of guarantee obtained when meat was received at a given establishment will be sufficient to satisfy the requirements of a second receiving establishment, should the first receiving establishment ship the product, depends on whether the first receiving establishment can guarantee that it prevented any E. coli O157:H7 growth or contamination of the product after its receipt and whether the second receiving establishment is willing to accept a letter of guarantee from the establishment that initially supplied product to the first receiving establishment. IX. Validation of Critical Control Points (CCPs) An establishment that determines that E. coli O157:H7 is a food safety hazard reasonably likely to occur must have one or more CCPs that are validated to eliminate or reduce E. coli O157:H7 below detectable levels. The receiving establishment does not have the responsibility for validating the CCPs used at the supplying establishment. The receiving establishment must:

\u2022 Ensure that the supplier meets purchase specifications; \u2022 Verify that the purchase specifications prevent the pathogen from entering the plant in product received; \u2022 Verify suppliers validated CCPs are effective on an ongoing basis \u2022 Maintain supporting documentation on their verification activities (417.5(a)(2);and \u2022 Validate and CCPs in their HACCP plan. 14", "If an establishment finds positive E. coli O157:H7 product and has not identified the pathogen as a hazard reasonably likely to occur, and therefore does not have a CCP for E. coli O157:H7 in its HACCP plan, the positive test would be considered an unforeseen hazard\"). In this case the plant must conduct corrective actions, including reassessing its HACCP plan under 9 CFR 417.3 (b). However, if an establishment has CCPs that address E. coli O157:H7, and the establishment or FSIS testing detects the pathogen, reassessment is not required but corrective actions under 9 CFR 417.3(a) should be taken. The establishment should examine its intervention methods. They should determine why they are not working. In slaughter establishments carcass mapping may be conducted to determine areas of carcass contamination. In addition, if FSIS testing finds E. coli O157:H7, the establishment may decide to intensify its verification program or ensure that the sensitivity of its testing method is equivalent to FSIS\"). A. Use of peer-reviewed studies for validation Peer-reviewed articles can be used as validation for a critical limit addressing E. coli O157:H7. Guidance materials that FSIS developed for slaughter establishments, grinders, and suppliers on minimizing the risk of E. coli O157:H7 contamination included the parameters of certain peer-reviewed studies. If using a peer-reviewed article, validation activities consist of repeatedly testing the adequacy of the CCPs, critical limits, monitoring, recordkeeping procedures, and corrective actions. Initial validation demonstrates that the establishment is able to repeatedly meet the parameters in the peer-reviewed article and verification that the pathogen is not detected. In order to determine that the intervention derived from the peer-reviewed article is controlling the pathogen, the validation process must be carried out in the establishment, subject to the establishment's facilities, processes, and unique conditions. All the parameters used in the study must be applied to the establishment's process. For example, a peer-reviewed scientific article has four parameters to be followed for the intervention to be effective. The establishment is only capable of meeting one of the parameters defined in the article. Then, the establishment cannot use the article to support the use of the intervention method. Additional validation would be needed using the new combination of parameters. This is important because if one parameter is changed, the interaction of the new combination of parameters will also change the results and the effectiveness of the intervention method. A challenge study (using pathogens) is one means to validate a process. Challenge studies should be conducted in a laboratory outside the establishment facility (i.e., do not conduct studies in an establishment if pathogens are intended to be introduced into the operation). B. Use of indicator organisms Intervention treatments to control E. coli O157:H7 should be validated by conducting challenge studies using E. coli O157:H7. However, these studies should not be conducted in the plant. Indicator organisms that are not pathogens can be used to demonstrate in-plant process control. Even though indicator organisms are not a true marker for the likely elimination or reduction of E. coli O157:H7, they are useful in studying the general effectiveness of plant interventions and making determinations about process control. FSIS recognizes that there is no true non-pathogenic surrogate organism that mimics pathogenic E. coli O157:H7. However, if at some

point in the future, establishments can demonstrate through valid studies that there is an organism that can be used as an indicator for E. coli O157:H7 this information should be submitted to the appropriate FSIS office. C. CCP for finished product testing to determine product disposition In most cases, a CCP based on finished product testing to determine product disposition would be inappropriate. However, for an establishment that conducts its own slaughter, fabrication, and grinding, and does not use product from other establishments, a CCP for disposition that relies on product testing may be acceptable. If the establishment includes CCPs at slaughter and fabrication, and a CCP for disposition based on finished product testing at a level sufficient to find the pathogen if present at very low frequency, then a CCP for disposition may be appropriate. In this case, the establishment would have identified E. coli O157:H7 as a hazard reasonably likely to occur and would have interventions for the pathogen. A positive test would therefore signify a deviation from the critical limit at the CCP. The critical limit for this CCP would have been that E. coli O157:H7 is non-detectable because of the intervention. Therefore the positive result would trigger corrective actions required under 9 CFR 417.3 (a), but not necessarily a reassessment of the HACCP system. The corrective actions may include examining the parameters used in the intervention method to ensure that they are used correctly, or determining whether the verification program needs to include more frequent testing, or conducting carcass mapping to determine areas of the carcass where contamination is more concentrated. If a grinder has internal controls for E. coli O157:H7, receives product from suppliers (both slaughter and fabrication establishments) that have controls for E. coli O157:H7, and the grinder and its suppliers conduct rigorous verification testing of the finished product at multiple points during the production process, a CCP for disposition based on finished product testing may be appropriate. A CCP for disposition based on finished product testing should employ testing at a level sufficient to find the pathogen if present at very low frequency. Corrective and preventive actions in response to a positive in finished product testing should accompany an examination of the whole system, not only the disposition of the product.

16"]},{"file\_name":"FSIS\_GD\_2009\_0002","title":"Peer Reviewed Articles of Antimicrobials Approved by the FDA and FSIS as Safe and Suitable Ingredients","num":"FSIS-GD-2009-0002","id":"9fd8c54deff59dfe44a466575a1013737476b59d7afc380bdbabff9784935e59","corpus":"fsis\_guidelines","source\_page\_url":"https://www.fsis.usda.gov/policy/fsis-guidelines","url":"https://www.fsis.usda.gov/sites/default/files/import/Chemical\_%2BAntimicrobials.pdf","type":"pdf","n\_pages":1,"word\_count":422,"text\_by\_page":["Compliance Guidelines for Retained Water The Retained Water In Raw Meat And Poultry Products (January 9, 2001) final rule requires that establishments produce those products with either no retained water or only the amount of water that is an unavoidable consequence of the process to meet food safety standards, such as the Salmonella performance standards. The amount of water retained must be specified on the product label. As noted in the preamble to the final rule, the Agency is not prescribing a method to determine added or retained water. The Agency is, however, requiring the establishment to prepare and have on file a written data collection protocol and the data for determining unavoidable moisture retention. If the establishment has data on file regarding retained water, such as antimicrobial spray testing for meat or air chilling for poultry, additional data collection may not be necessary. In addition to the final rule, FSIS is issuing these compliance guidelines with attached model data collection protocols. These

compliance guidelines are designed to assist establishments in developing their data collection protocols, maintaining operational control of their process, and properly labeling the finished product. Protocol Development Protocols for data collection must be placed on file and made available to FSIS. The Agency will review the protocols. The nine expected elements of a protocol are listed below. Examples of expected content are noted for each element. In the examples, the term chilling refers to poultry and cooling refers to meat.

1. Purpose Statement  
State the primary purpose of the protocol. The primary purpose should be to determine the amount or percentage of retained water that is unavoidable while achieving the regulatory performance standard for Salmonella and the time\temperature requirements for chilling. Additional purposes could be to evaluate product quality and to determine chilling system efficiency.

Example 1: The primary purpose of this protocol is to determine the amount of water absorption and retention by young chicken carcasses that is unavoidable while meeting the regulatory pathogen reduction standard for Salmonella set forth in the PR\HACCP regulations [9 CFR 381.94] and the time\temperature requirements set forth in 9 CFR 381.66.

Example 2: The primary purpose of this protocol is to determine the amount of water absorption and retention by beef carcasses that is unavoidable while meeting the regulatory pathogen reduction standard for Salmonella set forth in the PR\HACCP regulations [9 CFR 310.25(b)]. The protocol also will be used to evaluate product quality.

1","2. Type of washing and chilling\cooling system used by the establishment. Describe any post-evisceration washing or chilling\cooling processes that affect the water retention levels by, and microbial loads, on raw products. For poultry establishments, describe the main chiller types, e.g., the drag-through, the screw type, and the rocker-arm type, identified by the mechanism used to transport the birds through the chiller or to agitate the water in the chiller. For meat establishments, describe the type of coolers, e.g., blast freezers, refrigeration systems, or hot boxes.

3. Configuration and any modifications of the chiller\cooling system components. Describe the chiller\cooling-system configurations and modifications, including the number and type of chillers\coolers in a series and arrangements of chilling\cooling system components, and the number of evisceration\kill lines feeding into a chiller\cooling system. Accurately describe the purpose and type of equipment used if there is a pre-chilling\cooling step in the process. Describe any mechanical or design changes to the chilling\cooling equipment.

4. Special features in the chilling\cooling process. Describe any special features in the chilling\cooling process, including antimicrobial treatments, length and velocity of the dripping line, and total time allowed for dripping. Explain any special apparatus, such as a mechanism for removing excessive water from cooled meat or chilled birds.

5. Description of variable factors in the chilling\cooling system. Describe variable factors that affect water absorption and retention. In poultry processing, such factors include:

- \ufffd scalding temperature
- \ufffd pressure and amount of buffeting applied to the birds by feather removal machinery and its effect on loosening the skin
- \ufffd method used to open the bird for evisceration
- \ufffd temperature of the pre-chiller
- \ufffd water temperature of chiller
- \ufffd agitation including air agitation if used
- \ufffd time in the chiller water

In meat processing, such factors include:

- \ufffd scalding temperature (hog carcasses)
- 2"
- \ufffd amount and intervals of antimicrobial chill sprays
- \ufffd time in cooler rooms

6. Standards to be met by the chilling system. The Salmonella pathogen reduction standards, as set forth in the PR\HACCP final rule, have been suggested as the standard for pathogen minimization. Although there is not yet an

applicable Salmonella standard for turkeys, guidance standards are listed in Attachment 4 of FSIS Notice 22-01, "Procedures for FSIS personnel during pre-implementation period for retained water in raw meat and poultry products; poultry chilling requirements." (A permanent FSIS Directive will replace this Notice.) As stated in the Notice, establishments producing turkey products are free to adopt other microbiological targets or surrogate microorganisms, such as E. coli, Campylobacter, or reductions in numbers of other microorganisms. However, the acceptability of the surrogate microorganism in raw poultry or meat depends on an expert determination that there is a correlation between the surrogate and Salmonella. The chilling system for ready-to-cook poultry may be designed simply to achieve a reduction in the temperature to less than 40°F within the time limit specified by the regulations. On the other hand, the time for temperature reduction in meat may be based on that amount of time, or less, necessary to meet the performance standard for Salmonella and minimize the retention of water in the final product.

7. Testing methods to be employed. Describe testing methods used both for measuring water absorption and retention and for sampling and testing product for pathogen reductions at various chilling equipment settings and chilling time-and-temperature combinations. The method for calculating water absorption and retention should be reproducible and statistically verifiable. For pathogen reduction testing, FSIS recommends the methods used for E. coli and Salmonella testing under the PR/HACCP regulations. The pathogen reduction standards are based on a percentage of positive samples rather than the microbial load per carcass or carcass part. The number of samples, type of samples, sampling time period, type of testing or measurement, and the test results should be included. The trials should represent processing procedures that can be maintained in the establishment. It is understood that very small plants or those establishments producing a very small volume of the product may experience a greater variation in measurements than plants producing a large volume of the products. Initially, the establishment would perform several trials to determine the amount of unavoidable retained water, if any, in achieving the food safety standard. The establishment would have to determine the variables in the process that would affect the amount of retained water. For example, time in the chiller/cooler may be a variable to consider. In each trial the water retention data and Salmonella levels would be plotted. When the water retention data showed an increase in 3%, Salmonella, the time in the chiller/cooler before the increase could be the maximum amount of time allowable. However, if an antimicrobial rinse was used, the amount of time in the chiller/cooler may be further reduced. The primary purpose of the protocol is to determine the amount or percentage of retained water that is unavoidable while achieving the regulatory performance standard for Salmonella. However, the percentage of samples positive for Salmonella should not increase. It would not be regarded as acceptable to reduce the amount of retained water with a resultant increase in Salmonella, or surrogate microorganism, even if the increase in Salmonella met the performance standard.

8. Reporting of data and evaluation of results. Explain how data obtained are to be reported and summarized. Examples of reported information include, but are not limited to, the number of sample replicates, reporting of Salmonella, and the calculation or formula used to determine the level of water retention. In addition, the criteria for evaluating the results and the basis for conclusions to be drawn should be explained.

9. Conclusions Explain what the data demonstrate, the conclusions reached, and how the conclusions were reached.

Process Control Once a meat or poultry

establishment has determined the amount of water that is unavoidable in meeting applicable food safety requirements, the establishment must keep the water retention level in its products from exceeding that amount. The establishment must be able to ensure, on a continuing basis, that the amount of retained water in its raw products is unavoidable (9 CFR 441.10(a)), and that the product labels state the amount of retained water (9 CFR 441.10(b)). To be able to do this consistently, the establishment should have good process control. A process would be considered under control if there is a reasonable confidence (i.e., 95% statistical confidence) that a given package in a lot retains no more water than is unavoidable. That is, considering measurement and processing variables, there should be 95% confidence that the continuing measurements are within 20% of the moisture level determined at that establishment. If the establishment fails to meet the performance standards for E. coli and Salmonella, it should consider reevaluating its process with regard to retained water in addition to reassessing its HACCP plan. Labeling Retained Water Products Establishments will be required to include a retained water statement on labeling of raw, single-ingredient, whole, ground or cut-up meat or poultry products that retain water that 4", "is used in meeting food safety requirements during post-evisceration processing, e.g., chilling. Retained water is not regarded as intentionally added or as a product ingredient. However, the labeling of products with retained water must bear a prominent statement on the principal display panel disclosing the maximum amount of water, and how it got incorporated, e.g., \u201ccontains up to X% retained water,\u201d or \u201cwith X% absorbed water.\u201d The retained water statement must be prominently located on the principal display panel of the label and could be contiguous to the name of the product. Refer to Retained Water \u2013 Sample Labels. Prominence of the retained water statement is determined by several factors, including size of lettering in the statement compared with other lettering on the label, location of the statement, and color contrast between the lettering and the background. There is no specific letter size requirement for the percent-retained water statement. Establishments having data or information to demonstrate that their products do not contain retained water will not be required to label the products with such a statement and could include a \u201cno retained water\u201d claim on the label. Processors can modify existing labels by use of pressure sensitive stickers or indelible ink rubber stamps bearing the percent-retained water statement or a \u201cno retained water\u201d claim. This type of label change is possible under the generic label approval regulations. The generic labeling regulations 9 CFR 317.5 and 381.133 and the nutrition labeling regulations 9 CFR Part 317 Subpart B and Part 381 Subpart Y apply to retained water products as they do to other single-ingredient products. Multi-Ingredient Product Multi-ingredient product labeling is not affected by retained water in a meat or poultry component. Thus, retained water is not an ingredient, and the retained water statement on meat or poultry components is not an ingredient declaration. Refer to product examples. 1. Any retained water in raw meat or poultry items used as ingredients would not be declared on the labeling of multi-ingredient products, e.g., raw or cooked sausage, prebasted turkeys, or deli meats. 2. Retained water has no effect on the declared amount of flavor solution in basted, marinated, injected, tumbled, etc. products. 3. Standards of identity or composition are not affected by the retained water rule. 5", "Labeling Questions and Answers The Q&A\u2019s numbered from 1 through 18 first appeared in FSIS Directive 6700.1, Amendment 1. 1. If a plant determines through testing that the amount of retained moisture in a particular item is a fractional

percentage (e.g., 0.3, 0.4, 0.5, or 1.3 percent, etc.), how would the agency expect this to be labeled? Answer: As with nutritional labeling, rounding rules would apply (i.e., round to the nearest whole number). Therefore, labeling of fractional percentages of retained water would not be required. For example, 0.5 percent-retained water is rounded up to 1 percent and 1.3 percent is rounded down to 1 percent.

2. Are labeling statements permitted explaining the purpose of the retained water, e.g., \u201cfor safety purposes contains up to X percent retained water?\u201d Answer: Explanatory statements regarding the retained water will be reviewed by the Labeling and Consumer Protection Staff on a case-by-case basis since they are viewed as special claims. The statements will be evaluated to determine whether they misrepresent products or imply that products are safer than other similarly chilled products.

3. Is there a size requirement for the prominent lettering in the retained-water statement? Answer: There is no letter size requirement for the percent-retained-water statement, but if the lettering is inconspicuous or not visible to consumers with normal visual acuity, it is not prominent. Prominence is determined by several factors, including size of lettering in the statement compared with other lettering on the label, location of the statement, and color contrast between the lettering and the background.

4. Can the term \u201cmoisture\u201d be used instead of the term \u201cwater\u201d within the retained water statement? Answer: The term \u201cmoisture\u201d is not acceptable since it does not convey the specific substance used during the post-evisceration chilling of the product.

6", "5. Is the retained water statement required on a shipping container label when the product inside is packaged and labeled? Answer: The shipping container is not required to bear a retained water statement since the regulation addressing the labeling of retained water products applies to the principal display panel of immediate containers. Shipping containers holding packaged and labeled products do not have principal display panels.

6. Most meat carcasses, half carcasses, and primals are shipped from the establishment with only the mark of inspection identifying them. If the carcass gains water as a result of the chilling process, a water retention statement is required. How could an establishment meet this requirement if it is shipping full and half carcasses and primals to other establishments for further processing into retail cuts, ground beef, etc? Answer: Retained water in red meat carcasses, half carcasses, quarters, primals, or byproducts that are simply branded with a mark of inspection would also need to be declared with a prominent retained water statement. This could be accomplished by adding the retained water statement by branding or affixing with a secure tag.

7. Can pressure sensitive stickers be used to modify the percent-retained water statement and is handwriting permitted for the value of the retained water? Answer: Pressure sensitive stickers may be applied to labeling to modify the percent-retained water statement. This type of change is a generic approval. Handwriting is not permitted for the value of the retained water because a legibility factor involved with handwriting. The value should be uniform and produced by mechanical means as with other mandatory features.

8. The label contains a \u201cno retained water\u201d claim. Does the 20 percent variation apply? Answer: The 20 percent variation permitted for the retained water statement would not apply when a no retained water claim is made on labeling. Rounding rules apply. Thus, the product could not retain more than 0.49 percent water such that the rounded amount of water is 0 percent.

7", "9. How does retained water affect restricted ingredients, e.g., bacon? Answer: The levels for restricted ingredients remain the same as indicated in the substance chart, 9 CFR 424.21(c), e.g., sodium nitrite and sodium

erythorbate are based on the weight of the meat or poultry product regardless of the amount of water possibly retained in the meat or poultry as a result of post-evisceration processing. 10. Does the regulation cover products that may be treated with water which produces no gain in net weight of the finished product? Answer: The regulation, including its requirement of the submission of protocols, deals with products for which the manufacturer anticipates a particular water-based weight gain, is targeting its procedures to control that gain, and will label its products accordingly. As a result, establishments that anticipate zero weight gain are not required to develop and submit protocols. Such establishments should, however, maintain records that demonstrate through data or information that their product does not gain water as a result of the process. 11. Does the regulation apply to intermediate (in-process) processing steps? Answer: No. The regulation focuses on the labeling of single-ingredient finished products as they leave the establishment. Procedures, such as the application of antimicrobial solutions or of water that may temporarily contribute weight to the product, need not be declared. However, establishments are expected to maintain data clearly demonstrating that the finished products do not retain water. 12. Is it acceptable to export products with retained water without labeling bearing a percentage retained water statement? Answer: Deviations from domestic labeling rules are permitted in accordance with 9 CFR 317.7 or 381.128. However, the labeling record at the Federal establishment and in the label submission must assure that the labeling deviation is in accordance with the specifications of the foreign purchaser and with the laws of the foreign country. Additionally, the shipping container must be labeled to show that the product is intended for export. The documentation can be provided by the importer, the exporter, or an official with the foreign government of the country to which the product is destined. (NOTE: Labels for export product that deviate from the domestic requirements cannot be generically approved and must be submitted to the Labeling and Consumer Protection Staff for approval). 8", "13. Can one document, i.e., letter, be applied to multiple products for export? Answer: Yes, if the documentation is complete by indicating all exported products with labeling deviations and is only for the country to which the products are destined. 14. Does the retained water rule apply to ice-glazed poultry? Answer: Yes. A retained water statement is required because the product is single ingredient regardless of whether the product is ice-glazed or not. The ice-glaze is not an ingredient; its purpose is to prevent shrinkage during freezing. 15. How are single-ingredient products with retained water (e.g., bearing contains X percent retained water statements) handled when they are sent in bulk to retail stores for packaging? What effect would in-store cut-up or grinding operations have on the labeling of single-ingredient products with retained water at the retail store? Answer: The retained water statement that is applied to the cuts or ground products would be the same as the retained water statement that was applied to the bulk product. However, the retail store may choose to show through documentation that less or no water is retained in the cuts or ground product and to label the product accordingly. 16. What happens to a product when the retained water declaration exceeds the 20 percent label declaration? Answer: The company has two options. One is to accurately re-label the product. The other option would be to allow the product to drain so that the retained water statement is truthful. This may involve re-packaging the product unless the product is ice pack poultry in drainable containers. 17. How is the retained water statement handled with chitterlings since the product is allowed to be packaged with up to a 20 percent purge? Answer: Many years ago, before 1992, FSIS allowed, under

normal conditions and good manufacturing practices, purge in containers of chitterlings not to exceed 20 percent of the marked weight of the product. The policy is long-held and is practiced industry wide. Consumers who purchase 9", "this product are aware of the policy and practice and have come to expect moisture content in chitterlings. As a result of this long-standing policy, no retained water statement is required when chitterlings are packaged with a purge. If chitterlings retain water during post evisceration processing and are not packaged with a purge, the product\u2019s labeling is required to bear a retained water statement. 18. What is FSIS position regarding the use of water in thawing process? Answer: Frozen meat, meat byproducts, poultry, or poultry byproducts are often thawed using chilled water.

Establishments have to assess whether the product is absorbing water during the thawing process. If the final product is raw, single-ingredient, and absorbed water during the thawing process, a retained water statement is necessary. However, if the final product is subsequently processed into a multi-ingredient item or cooked, the retained water is not a labeling or standards concern. Labeling Questions and Answers Not Addressed in Directive 6700.1,

Amendment 1 General Labeling Issues 19. Is ice chilling of single-ingredient product subject to the retained water rule? Answer: Yes when ice is directly applied to single-ingredient raw carcasses or parts for food safety purposes and the product consequently gains water, they are subject to the retained water regulation. Similarly, raw single-ingredient carcasses or parts mixed with iced used for food safety purposes that are consequently processed into single-ingredient products are subject to the retained water rule, e.g., iced frames and\or shells processed through a mechanical deboner for mechanically separated poultry. Water in excess of naturally occurring moisture at a level at or above 0.5 percent would require a prominent retained water declaration on the label. The establishment must maintain a written data-collection protocol on file in accordance with the retained water regulation. Conversely, an establishment does not have to maintain a protocol on file if it has data or information that clearly demonstrate that its raw single-ingredient product does not retain water as a result of a food safety process, e.g. ice chilling of frames or shells for food safety purposes where the end product does not retain water from the ice treatment. 10", "20. Is it acceptable to indicate the percentage of retained water on a pricing label that is placed on the principal display panel of raw single-ingredient parts packaged in a tray-pack or a raw single-ingredient carcass in a bag?

Would the statement on a pricing label meet the requirement that the statement is on the principal display panel? Answer: Yes, the location requirement is met when the retained water statement is placed on the weight and price sticker (in an area that is not intended for the weight or price), which is subsequently placed on the principal display panel. Of course, the retained water statement must be prominent. 21. Can the retained water statement be placed on a hang-tag at the neck of a netted bag containing a vacuum packaged meat or poultry product with retained water? Answer: Yes, the retained water statement can be placed on a hang-tag as long as the statement is prominent and readily visible to the consumer. 22. Can meat or poultry with retained water be irradiated? Answer: Yes, in accordance with the current Federal meat and poultry inspection regulations. 23. Can meat or poultry with retained water bear the claims natural,\u201d \u201c100 %,\u201d or \u201cpure?\u201d Answer: Yes, in accordance with the regulations and policies on the use of these claims. 24. If the water retention statement is added to a bi-lingual label, does it need to be in both languages?

Answer: Yes, the water retention statement should be in both languages. 25. Are giblets that

are inserted into the cavity of a whole poultry carcass subject to the retained water regulations? Answer: Yes. A whole carcass with giblets is regarded as a single-ingredient product in the same manner that a package of poultry parts, e.g., drumsticks, thighs and breasts are a single ingredient product. 26. How is mixed percent meat or poultry with retained water labeled when packaged together, e.g., packaged cuts or whole birds packaged with necks and giblets? Answer: The labeling for meat or poultry with retained water from different sources bearing different retained water statements can be easily accomplished by labeling the product with a highest range statement from the multiple suppliers, e.g., "less than 11%," "6% retained water." A range statement with the highest value clearly indicates that a range is present, e.g., "may contain up to X% retained water" or "not more than X% absorbed water." As an option, the label could bear separate retained water statements for each item within the package, e.g., "whole bird with 5% retained water, necks with 3% retained water and giblets with up to 2% retained water." 27. Could check-off blocks be used on immediate container labeling for identifying different retained water statements? Answer: Yes, provided, establishment operators develop a control procedure which would ensure correct labeling of the packaging of end products that look alike but contain varying amounts of retained (absorbed) water. The procedure should demonstrate what steps the establishment operators will take so the appropriate retained water statement check-off block will be marked and how the company will monitor the product to ensure proper labeling. The procedure is part of the labeling record. This information is similar to FSIS Directive 7220.1, Policy Memo 083A Check-Off Blocks on Labeling. Can the labeling of product that has been fabricated into cuts or ground products from carcasses and parts bear retained water statements with lesser values or no value? 28. Can the labeling of product that has been fabricated into cuts or ground products from carcasses and parts bear retained water statements with lesser values or no value? Answer: Yes, however, the company should have data on file that shows the loss. The method used for determining the loss is the company's choice but results of the data should be reproducible and verifiable. 29. Can an average be used for the retained water statement when meat or poultry with different retained water levels is packaged together and labeled? Answer: No, the labeling would bear a statement reflecting the highest range, e.g., "less than 4% retained water" or "contains up to 3% retained water" unless the company can document a loss. The method used is up to the company but the results should be reproducible and verifiable. 30. Can an added solution statement like those on marinated product labeling be used in place of a retained water statement? Answer: No, an added solution statement may not be used on a raw, single-ingredient meat or poultry products in which retained water is merely the by-product of a process intended to meet applicable food safety requirements. Added solution statements are only permissible when water is used as an ingredient rather than absorbed during a process intended to achieve a food safety objective. 12%," 31. Are absorbent pads used to absorb moisture in packages of product part of the net weight of the product? Answer: It varies depending upon the jurisdiction, i.e., wet tare jurisdiction versus dry tare jurisdiction to determine net weight. Compliance with net weight regulations is determined by following the wet-tare and dry-tare procedures in National Institute of Standards and Technology Handbook 133, which are incorporated by reference in FSIS regulations 9 CFR 317.19 and 381.121(b). 32. Can retained water in the product be tared out of the net weight so that the retained water

statement does not have to be labeled? Answer: No. 33. Can the purge during shipping and distribution be subtracted from the amount of retained water absorbed during post-evisceration processing for the purpose of labeling with the retained water statement based on the loss of the purge? Answer: No. 34. Can a rubber stamp with indelible ink be used to mark labeling with the retained water statement? Answer: Yes, the marking of labeling with a rubber stamp coated with indelible ink is permissible as long as the statement is prominent and located on the principal display panel. 35. Is mechanically separated meat or poultry subject to the retained water rule? Answer: Yes, as long as the product is raw and single-ingredient. 36. Do insert labels have to bear a retained water statement? Answer: No. They are not required to bear the retained water statement. While the insert label is not required to bear the retained water statement, the retained water statement must prominently appear on the principal display panel. 37. Are raw single-ingredient meat and poultry products processed prior to January 9, 2003, and warehoused in cold storage subject to the retained water rule? Answer: Product processed prior to January 9, 2003, is not governed by the retained water rule. 38. Can export labels with labeling deviations be generically approved instead of sending the labeling applications to the Labeling and Consumer Protection Staff for sketch approval? 13", "Answer: The generically approved label regulations do not provide for generic approval of labeling with deviations, which is why generic label approval is not acceptable. Labeling with deviations have to receive sketch approved from the Labeling, Consumer and Protection Staff until the generic labeling regulations are changed. 39. Are giblets that are inserted into the cavity of a basted turkey carcass subject to the retained water regulations? Answer: No, the retained water statement for the giblets is not required on the labeling of the basted turkey because the giblets are packaged within a multiingredient product. Retained water statements are not mandatory on multi-ingredient product labeling since multi-ingredient product labeling is not affected by retained water. 40. The product is a single-ingredient whole duck with giblets but which may contain a packet of stuffing or sauce. Is a water retention statement required? Answer: Yes, when a sauce or stuffing packet is indicated as \u201cfree\u201d on the duck label, the duck with giblets would have to be labeled with a retained water statement if the carcass and\or giblets has absorbed any post evisceration water. In such a situation, the duck with giblets would still be regarded as a single-ingredient product since only the duck with giblets is sold. The labeling would have to include information regarding the packet, e.g., a product name qualifier \u201cfree sauce (stuffing) packet,\u201d and an ingredients statement. On the other hand, when a sauce or stuffing packet is packaged with the duck and giblets, and not labeled as free, the product is a multi-ingredient product, and the retained water statement for the whole duck with giblets is not mandatory. 41. Can salt be added to a chiller for poultry carcasses and parts? If that is possible, is a retained water statement necessary? Answer: Salt is a permitted additive in chill water for raw poultry products according to 9 CFR 424.21. When the amount of salt is 70 pounds or below in 10,000 gallons of water, the salt would not need to be labeled because it would be an incidental additive. A retained water statement would then be mandatory if the product absorbed the chiller solution. On the other hand, when salt is in amounts from above 70 pounds up to 700 pounds per 10,000 gallons of water, the water and salt would have to be declared since both substances are additives. A special labeling statement would be required, e.g., \u201cBrine Chilled in Water and Salt\u201d or \u201cChilled in Water and Salt.\u201d When the pickup of the solution in the carcasses or

parts is less than 0.5 percent, the product would not need a percentage declaration in the special labeling statement. In situations where the pickup of the solution is 0.5 percent or greater, the special labeling statement would include the percent of solution rounded to the nearest whole number, e.g., "Chilled in 1% Water and Salt." 42. Do the antimicrobial solutions need to be declared on the label? Answer: When approved antimicrobial agents are used in meat or poultry processing for the momentary reduction of microorganisms, and are determined by FSIS to be consistent with FDA's definition of an incidental additive (21 CFR 101.100(a)(3)), they do not require labeling. The treatment of meat or poultry with an approved antimicrobial agent in water should not result in the product retaining any water. Therefore, as long as an establishment can demonstrate that no water is absorbed during, prior, or subsequent to processing steps, such as chilling, a meat or poultry product's labeling would not need to bear a retained water statement. Exemptions or Religious Dietary Product Labeling 43. Is meat or poultry with retained water that will be shipped for further processing exempt from bearing a retained water statement? Answer: No, all raw, single-ingredient product with water retained as a result of post-evisceration processing used to meet a food safety standard must be properly labeled with a declaration showing the amount of retained water prior to shipment. 44. Are inspected kosher meat or poultry products exempt from the retained water rule? Answer: No, kosher carcasses and parts are soaked and salted during a process called kashering. Any water absorbed as a result of the kashering process does not need to be declared as part of a retained water statement. However, any water above naturally occurring water that is absorbed during other prior or subsequent process steps, such as chilling, does need to be declared. Such products would bear the retained water statement if they absorbed water prior to kashering or after kashering. Although, kosher carcasses and parts are labeled as "soaked and salted," they are not considered multi-ingredient products. 45. Is religious exempt poultry subject to the retained water rule? Answer: No, labeling of poultry slaughtered under religious exemption does not bear the mark of inspection. Labeling of poultry that bears an inspection legend is subject to the retained water rule. 46. Is the retained water statement required on labeling of uninspected raw single-ingredient product, e.g., non-certified pet food? Answer: No, the retained water statement is exempt from labeling of uninspected products. 47. When retail service cases display unpackaged raw single-ingredient meat or poultry products, should the retained water in the product be declared? Answer: Yes, the retained water statement is required adjacent to the product, e.g., case card, placard, or shelf tag, which would provide information about the product. The retained water statement is necessary because it is mandatory information that indicates an aspect of the product that is different from similarly processed products that absorb no water used for food safety purposes 48. Do packaged meat or poultry products with retained water sold from a retail service case displaying unpackaged product have to be marked with the retained water statement? Answer: Yes, the package of the product would bear an accurate label that includes the retained water declaration. 49. When a retail store buys from multiple suppliers of meat or poultry with retained water and displays unpackaged product in a retail service cases, can they simply label the product with the declaration of the supplier claiming the greatest amount of retained water rather than label product with multiple declarations? Answer: Yes, the labeling for meat or poultry with retained water from several sources bearing different retained water statements

would be achieved by using the highest range statement from the multiple suppliers, e.g., "less than 6% retained water." A range statement with the highest value does indicate an assortment of various retained water statements were present on suppliers' products packaged together, e.g., "chicken legs may contain up to 5% retained water" or "beef liver not more than 4% absorbed water."<sup>50</sup> When transportation to retail and display for retail (i.e. placement on draining racks) cause the product to release purge and thus decreases the total amount of retained water, how can the retail service counter relay this information to consumers? Would the service counter have to do their own analysis based on their practices and label accordingly? Answer: Labeling with the highest range retained water statement would be the easiest method available. However, if the service counter can document the amount of drainage, the product can be labeled with a reduced value in the retained water statement. Also, if the service counter can document that all the retained water has drained from the product, a retained water statement is unnecessary. The method used to determine the loss is the retailer's choice but the results should be reproducible and verifiable.<sup>16</sup>, "Retained Water Sample Labels 17", "Product Examples Product Examples from FSIS Directive 6700.1, Amendment 1, 1/7/2003. Example 1 Basted turkey injected with up to 3 percent flavor solution is made with turkey containing 3 percent absorbed water. The ingredient declaration would not identify any retained water in the turkey that would have possibly been absorbed during post evisceration processing in the slaughter establishment because the retained water is not an ingredient. The retained water in the turkey would not affect the 3 percent flavor solution injected into the product and declared as part of the product name. Example 2 Beef and Turkey Italian Sausage contains starting material that is labeled as turkey containing 3 percent retained water.<sup>17</sup> The ingredient declaration would not identify the retained water in the turkey because the retained water is not an ingredient. The post evisceration retained water in the turkey would not affect the 3 percent added water limit for the finished product that is established by the standard of identity or composition. Water added to facilitate mixing to dissolve ingredients is an ingredient and is permitted up to 3 percent in raw sausage. Example 3 When beef trimmings that have been sprayed with chilled water so that they contain 5 percent retained water are used to make a single ingredient raw ground product, like ground beef or hamburger, the resulting product must be labeled to declare any retained water above naturally occurring water. Also, single-ingredient ground poultry produced from poultry containing retained water would be required to be labeled to declare any retained water above naturally occurring water. The retained water would not affect compliance with the standard, i.e., no added water, because retained water is not an ingredient. If the products were subsequently cooked, the retained water would have no effect on the finished product or its labeling.

Compliance with the requirements set forth in this publication does not, in itself, guarantee an authorization. On receipt of the label application, consideration will be given to suitability of ingredients statements, preparation, and packaging so as not to mislead the consumer. Adherence to the product and label requirements in this Policy Book does not necessarily guarantee against possible infringement of all related patents, trademarks or copyrights. Changes in this publication are to add new entries, correct errors, condense material, and reformat the entries for ease in reading and use. There will be updates of the publication to conform to changes in meat and poultry inspection standards and to reflect any current policy developments. Errors found in this issue should be reported through channels to your district office.", "INTRODUCTION This Policy Book is assembled in dictionary form and may"]}

be used in conjunction with the Meat and Poultry Inspection Regulations and the Meat and Poultry Inspection Manual, Directives and Notices. It is a composite of policy and day-to-day labeling decision, many of which do not appear in the above publications. They are subject to change and therefore a periodic updating of this book will take place. Note: Red Meat Required percentages of meat required for red meat products are shown on the basis of fresh uncooked weight unless otherwise indicated. For purposes of this Policy Book, whenever the terms beef, pork, lamb, mutton, or veal are used they indicate the use of skeletal muscle tissue from the named species (9 CFR 301.2). Note: Poultry Required percentages for poultry products are based on a cooked deboned basis unless otherwise stated. When the standards indicate \u201cpoultry\u201d, the skin and fat are not to exceed natural proportions per (9 CFR 381.117(d)). Applications for label approval should be addressed as follows: USDA, FSIS, OPPD Labeling and Consumer Protection Staff (LCPS) 1400 Independence Avenue, SW Room 614 \u2013 Annex Building Washington, DC 20250-3700 Product samples (only when requested by LCPS) should be packed with sufficient refrigerant to last until received. Shipping should be coordinated with requestor to assure delivery before 4:00 p.m. Friday. AGED: Aging is the process by which fresh beef (carcasses or cuts) are held in a controlled environment for a specified period of time of slaughter, to allow enzymatic activity to degrade complex proteins and promote the development of flavor and tenderness. The term \u201cAged\u201d on a label must be qualified, e.g., \u201cAged 65 days.\u201d See: Dry Aged AGED BEEF: The beef products (carcass or cuts) are maintained in a fresh unfrozen state for a minimum of 14 days from the day of slaughter. Aging claims made within the supply chain (e.g., prior to the point of sale at retail or food service) shall specify the minimum number of days aged and the type of aging used on the principal display panel on the label (e.g., \u201cWet aged for a minimum of days.\u201d). If an aging claim is made at the point of sale to the consumer, the minimum claimed for aging shall appear on the principal display panel of the label (e.g., \u201cAged for a minimum of a minimum of days.\u201d). For additional information refer to USDA, AMS, Standardization Branch \u201cALL\u201d, \u201cPURE\u201d, AND \u201c100 PERCENT\u201d POULTRY: A labeling claim, such as, \u201cmeat used is 100 percent white meat\u201d, may only be used when the poultry meat contains no added ingredients. A labeling claim, such as, \u201cwhite meat only,\u201d is acceptable when white meat is used to the exclusion of dark meat. In this situation, other ingredients may be present in the poultry portion of the product.", "\u201cALL or 100 PERCENT BEEF (Patty Mix)\u201d: Beef patty mix may be labeled \u201call,\u201d \u201cpure,\u201d or \u201c100 percent beef,\u201d when the only added ingredients are partially defatted chopped beef or finely textured beef. An ingredients statement would be required on bulk packed product but not retail packages. \u201cAll,\u201d \u201cPure,\u201d or \u201c100 percent,\u201d may not be used if partially defatted beef fatty tissue (PDBFT), is used or mechanically separated species (MSS), are used. ALPHA CELLULOSE: When used as a carrier of flavoring ingredients, it need not be shown in the ingredients statement, unless it functions as a

binder in the meat or poultry product. AMENABILITY: The Federal Meat Inspection Act (FMIA) and Poultry Products Inspection Act (PPIA), and their implementing regulations, provide for certain exemptions from USDA jurisdiction (and, therefore, inspection), e.g., products prepared for human consumption that contain meat or poultry ingredients in relatively small proportions, or are not considered by consumers to be products of the meat or poultry industry. Generally, the USDA has determined by policy that the \u201crelatively small proportions\u201d of livestock ingredients are: 3 percent or less raw meat; less than 2 percent cooked meat or other portions of the carcass; or 30 percent or less fat, tallow or meat extract, alone or in combination. In the case of poultry, the \u201crelatively small proportions\u201d are: less than 2 percent cooked poultry meat; less than 10 percent cooked poultry skins, giblets or fat, separately; or less than 10 percent cooked poultry skins, giblets, fat and poultry meat (limited to less than 2 percent) in any combination (refer to 9 CFR Part 381.15(a)). For dried products containing poultry, these percentages are computed on the basis of the moist cooked chicken in the ready to serve product when prepared according to the directions on the consumer package. Regarding the second exemption criterion, the USDA has determined the application of the \u201chistorical perception\u201d criterion to food products containing meat or poultry on a case-by-case basis. Some products that are exempted from USDA jurisdiction based on the criteria above include stocks or broths prepared with \u201crelatively small amounts\u201d of meat or poultry, bouillon cubes, dehydrated meat soups, cheese balls with pepperoni, pork and beans, closed-face sandwiches, mince meat, bagel dogs, and pepperoni rolls. A condition for the application of these exemptions is that product exempt from USDA jurisdiction must still be prepared with USDA inspected meat or poultry product or meat or poultry from an inspection system equivalent to the USDA inspection system. In addition, generally, any product exempted from USDA jurisdiction cannot be represented as a meat food or poultry product, except as provided in the meat or poultry regulations. A product is deemed as representing a meat food or poultry product if a term representing meat or poultry is used on labeling, e.g., in the product name, without appropriate qualification.", "ANDOUILLE (FR): Made with pork and/or pork byproducts stuffed into large intestines. Product can be sold cooked or uncooked.

Andouille is a coined name and must be accompanied by a true product name, e.g., \u201csausage\u201d or \u201cpudding\u201d depending on formulation. If beef is used, it must be shown in the product name, e.g., \u201cBeef Andouille Sausage\u201d or \u201cBeef Andouille Pudding.\u201d ANTIOXIDANTS: BHA and BHT are permitted in spice mixtures at 0.02 percent of the essential oil content without declaration on meat or poultry food product labels. Antioxidants are permitted in cooked fresh sausages and fresh sausage-like products (e.g., a pork, water soy protein product). BHA and BHT are not permitted in non-specific meat or poultry products. APPROXIMATE: The word \u201capproximate\u201d may be used to describe the thickness of bacon and the number of pieces in an institutional package when the actual net weight is declared (for example, 18 21 pieces). \u201cApproximately\u201d is acceptable in a descriptive designation for meat and poultry products (for example, \u201cContaining approximately 6% of a solution of...\u201d or \u201cMarinated with approximately 3% solution of...\u201d). The word \u201capproximate\u201d cannot be used in conjunction with the serving size or the required declaration of net weight of contents. ARROZ CON POLLO (SP): The product must contain at least 15 percent cooked chicken meat. The label must show, the true product name, in English, i.e., \u201cRice with Chicken,\u201d except if the product is

distributed solely in Puerto Rico. ARTIFICIAL MARBLING -RED MEAT PRODUCTS: Fats and oils, for example, butter, margarine, vegetable oils. etc., may be added to red meat products, for example, roast beef and steaks. However, the presence of such substances must be indicated as part of the product name, as a product name qualifier, or in a solution statement, for example, \u201cRoast Beef and Margarine Product,\u201d \u201cVegetable Oil Added,\u201d \u201cContaining 10% of a solution of milk,...\u201d All applicable regulations and policies should be followed for these products. In addition, products that appear to be of a higher quality must include a statement to indicate this, for example, \u201cInjected with Beef Fat\u201d or \u201cProduct may appear to be of a higher quality than the actual grade.\u201d Samples may be necessary to determine if this requirement applies.", "ARTIFICIALLY COLORED PRODUCTS: Labels of products which are artificially colored either by artificial colors or natural colors must bear a statement to indicate the presence of the coloring, e.g., \u201cartificially colored\u201d or \u201ccolored with annatto.\u201d Products whose true color is disguised by packing media, e.g., colored pickling solutions, must also have labels that include a statement that indicates the presence of the color. The statement must appear in a prominent and conspicuous manner contiguous to the product name. When a component within a product is artificially colored, e.g., breading, sauce, and sausage, a qualifying statement is not necessary. However, in all cases, the presence of the coloring must appear in the ingredients statement. Whenever FD&C Yellow No. 5 is used, it must be declared in the ingredients statement by FD&C Yellow No. 5 or Yellow 5. Some products, e.g., chorizos and some of the sausages of the longaniza variety, are expected to be characterized by coloring. In these situations, the presence of the coloring need only be indicated in the ingredients statement. See: Policy Memo 112 on caramel coloring Policy Memo 095 on colored casings Policy Memo 113 dated June 24, 1988 AU GRATIN POTATOES AND BACON: At least 8 percent fully cooked bacon (based on 40 percent yield). BABY FOOD: High Meat Dinner -At least 26 percent meat. High Meat Poultry Dinner -At least 18.75 percent cooked poultry meat, skin, fat and giblets. Meat and Broth -At least 61 percent meat. Vegetable with Meat -At least 8 percent meat. Poultry with Broth -At least 43 percent cooked poultry meat, skin, and giblets. Poultry and Rice -At least 5 percent cooked deboned poultry meat. Note: Wine, Mechanically Separated Species, nitrites, and nitrates are not acceptable in baby and toddler foods. BABY FOOD WITH FRESH HAM OR BACON: Ham or bacon without nitrates or nitrites must be shown in the ingredients statement as ham or bacon (water, salt, sugar, etc., without nitrates or nitrites).", "BACON: The term \u201cbacon\u201d is used to describe the cured belly of a swine carcass. If meat from other portions of the carcass is used, the product name must be qualified to identify the portions, e.g., \u201cPork Shoulder Bacon.\u201d \u201cCertified\u201d refers to products that have been treated for trichinae. See: 9 CFR 318.10 BACON AND PORK SAUSAGE: Product is formulated with a high percentage of bacon (usually bacon ends and pieces) with at least 20 percent pork. BACON ARKANSAS AND ARKANSAS STYLE BACON: Product which is identified as Arkansas Bacon or Arkansas Style Bacon is produced from the pork shoulder blade Boston roast. The pork shoulder blade Boston roast includes the porcine muscle, fat and bone, cut interior of the second or third thoracic vertebrae, and posterior of the atlas joint (first cervical vertebrae), and dorsal of the center of the humerus bone. For Arkansas Bacon, the neck bones and rib bones are removed by cutting close to the underside of those bones. The blade bone (scapula) and the dorsal fat covering, including the skin (clear plate), are removed, leaving no

more than one-quarter inch of the fat covering the roast. The meat is then dry cured with salt, sugar, nitrites, and spices, and smoked with natural smoke. The meat may not be injected or soaked in curing brine, nor may any artificial or liquid smoke be applied to the meat. Product that is prepared outside the state of Arkansas but in the manner prescribed may be identified as "Arkansas Style Bacon." The true product name must be shown as  
"Boneless Cured Pork Shoulder Butt." BACON (Canned -Pasteurized): A shelf stable item, which must have at least 7 percent brine concentration. BACON (Canned, Prefried): In  
"Canned Prefried Bacon," e.g., "Bacon Crumbles," the following criteria should be applied: 1. M/SP Index of 0.4 or more. M/SP = Moisture/(Salt x Protein) 2. A Brine Ratio of 9.0 or less. Brine Ratio = Moisture/Salt", 3. A Brine concentration of 10 percent or more. Brine concentration = Salt/(Moisture + Salt) 4. Maximum 40 percent yield BACON (Cooked): Not to yield more than 40 percent bacon -60 percent shrink required. BHA and BHT may be used as antioxidants in precooked bacon at level of 0.01 percent individually or 0.02 percent collectively, based on fat content. TBHQ can be used in products as an antioxidant in combination with BHT and BHA; but it can not be used alone except in cooked bacon. BACON DRESSING FOR STUFFING: The product must contain at least 8 percent bacon. BACON-LIKE PRODUCTS: Bacon-like products, including poultry bacon, labeled with "bacon" in the name must follow the same requirements as those applied to pork bacon. These requirements include, but are not limited to, limits on restricted ingredients and the requirement that the bacon must return to green weight. Beef bacon is a cured and smoked beef product sliced to simulate regular bacon. It is prepared from various beef cuts and offered with a variety of coined names, including "Breakfast Beef," "Beef Bacon," etc. A common or usual name is required, e.g., "Cured and Smoked Beef Plate," and should be shown contiguous to the coined name. Poultry bacon products are acceptable and may be designated as (Kind) Bacon. However, a true descriptive name must appear contiguous to (Kind) Bacon without intervening type or design, in letters at least one-half the size of the letters used in the (Kind) Bacon, and in the same style and color and on the same background. An example of an acceptable designation is "Turkey Bacon-Cured Turkey Breast Meat-Chopped and Formed." The descriptive name can serve alone as the product name. See: Policy Memo 106A dated December 17, 1991 BACON PRODUCTS: The bacon products intended for further cooking before consumption, i.e., slab bacon for deli slicing, can be labeled "certified," "croasted" or "partially cooked" provided the product is cooked to 148°F and the labeling clearly indicated the product is intended to be further cooked before consumption.", "BANGERS: A sausage-like product prepared with meat and varying amounts of rusk or other cereals. The label must show percentage of rusk (or other cereal) adjacent to product name in prominent lettering. May be labeled British, Scottish or Irish Style. BARBECUE (BBQ), PRODUCTS: Barbecue (BBQ), products that are composed of uncured red meat products that are injected, massaged, tumbled, etc., and which are cooked back to or below the weight of the raw meat product (green weight), must use the term "seasoned" or "flavored" in conjunction with the meat product in the product name, e.g., "BBQ Seasoned Pork," or "Sliced Seasoned Beef with Barbecue Sauce." The labeling for uncured red meat products containing some solutions that are used to make BBQ products (9 CFR 319.312 or 319.80) which are not cooked back to green weight or are not in compliance with the cooking yield must have

a containing statement on the label. A containing statement is required in the product name when the cooking yield is not met, e.g., \u201cBBQ Pork Containing up to 15 percent of a solution.\u201d Similarly, a containing statement is required in the product name when the product does not have sufficient quantities of meat minus the solution to meet the minimum meat requirement. However, in limited situations when the minimum meat requirement (minus the solution) is met and when cook yield is compensated for by adding additional meat, the containing statement can either be placed in the product name or attached to the meat component in the ingredients statement, e.g., \u201cIngredients: Beef Containing up to 25 percent \u2026sugar, spices.\u201d Also, see Policy Memo 84A and Policy Memo 102. Red meat components that contain binders and extenders and do not meet one of the barbecue standards (9 CFR 319.80, 319.312) shall be descriptively labeled to include the extender, nomenclature in the product name, e.g., \u201cBBQ Seasoned Beef, Modified Food Starch and Gelatinized Wheat Starch\u201d, \u201cPork and Binder Product with Barbecue Sauce\u201d, or \u201cBBQ Cooked Beef and Binder Product\u201d followed by a parenthetical list of all of its ingredients. Bone-in red meat products do not have to comply with Federal meat regulation, 9 CFR 319.312 or 319.80 with regard to cooking yield and must indicate the presence of bones in product name, e.g., \u201cSeasoned Cooked Pork Ribs with Barbecue Sauce\u201d or \u201cBarbecue Beef Ribs.\u201d When bone-in red meat products are injected, massaged, tumbled, etc., and do not return to green weight after cooking, the containing statement shall appear once on the label in (1) the ingredients statement as part of the red meat component (only if there is enough Beef Ribs without solution to meet the requirement for \u201cBeef Ribs and BBQ Sauce\u201d), or (2) in the product name, e.g., \u201cBeef Ribs, containing 10 percent of a solution and BBQ Sauce.\u201d", "BARBECUE (Infrared Cooked): The label must indicate heat source, e.g., \u201cinfrared cooked,\u201d with lettering no less than one-half the size of the largest letter in the word \u201cbarbecue.\u201d BARBECUE MEAT OR POULTRY \u201cEASTERN NORTH CAROLINA STYLE\u201d: Acceptable identification for barbecued meat (9 CFR 319.80) or barbecued poultry (9 CFR 381.164 or 381.165) product that is flavored with a vinegar based solution using apple cider vinegar or white vinegar. The solution is seasoned with pepper, that is, black pepper, red pepper, or cayenne pepper. Other ingredients may include salt, sugar and hot pepper sauce. BARBECUE SAUCE WITH CHICKEN: The product must contain at least 15 percent cooked chicken meat. Changing the size of the term \u201cChicken\u201d does not change the 15 percent cooked chicken meat requirement. BARBECUE SAUCE WITH MEAT: The product must contain at least 35 percent cooked meat. When the name of the product shows meat in smaller letters, not more than one-half the size of the largest letter in the product name, 25 percent cooked meat is required. BEEF A LA KING: The product must contain at least 20 percent cooked beef. BEEF A LA MODE: A product consisting of sliced cooked beef (that is marinated in wine, cognac, vegetable stock) with carrots, onions, and other ingredients covered with wine sauce. The product must contain at least 50 percent cooked beef. BEEF ALMONDINE WITH VEGETABLES: The product must contain at least 18 percent cooked meat on the ready-to-serve basis. The product must contain almonds. BEEF AND DUMPLINGS WITH GRAVY: The product must contain at least 25 percent meat and not more than 25 percent water blanched dry dumplings. BEEF AND GRAVY: The product contains at least 50 percent cooked beef.", "BEEF BLOOD: This is an acceptable ingredient for beef patties provided the product name is qualified, such as \u201cBeef and Blood Patties\u201d or

\u201cBeef Patties with Blood.\u201d BEEF BLOOD GLAZE: A coating of beef blood is permitted on cured products (e.g., ham, hamette, etc.) if the product name is prominently qualified to reflect the coating. Nitrite is not permitted in the glaze. BEEF BRISKET (Canned): The minimum brine concentration required is 5.5 percent. BEEF BURGUNDY OR BOURGUIGNONNE: The product must contain at least 50 percent beef. Product contains beef cubes, mushrooms, onions, and red wine or burgundy gravy. May include other vegetables, e.g., carrots, shallots, tomato paste, or potatoes. Other acceptable names include \u201cBeouf A La Bourguignonne,\u201d \u201cBeef Burgundy Style,\u201d \u201cBeef Burgundy,\u201d and \u201cBurgundy Beef.\u201d BEEF BURGUNDY WITH NOODLES: The product must contain at least 50 percent beef in the beef burgundy portion. Total product should not contain more than 50 percent cooked noodles. BEEF CHEEK MEAT AND BEEF HEAD MEAT AND PORK CHEEK MEAT AND PORK HEAD MEAT (USE AND LABELING AS AN INGREDIENT IN MEAT FOOD PRODUCTS): Beef cheek meat and pork cheek meat refers to beef and pork cheeks from which the glandular material has been removed. Beef head meat and pork head meat refer to muscle tissue remaining on the beef and hog skull after removal of the skin, cheeks, tongue, and lips. The meat normally attached to and considered as part of the tongue trimmings when detached from the tongue trimmings may also be included as beef head meat or pork head meat although it can be labeled as \u201cbeef\u201d or \u201cpork.\u201d When beef cheek meat and/or beef head meat are included in boneless beef, its presence must be specifically declared. Examples include: \u201cBoneless Beef -Contains Beef Cheek Meat and Beef Head Meat,\u201d \u201cBoneless Beef Head Meat,\u201d \u201cBoneless Beef - Ingredients:\u201d, "Beef, Beef Head Meat, Beef Cheek Meat,\u201d or \u201cBoneless Beef -20 percent Beef Head Meat, 15 percent Beef Cheek Meat.\u201d Beef cheek meat and/or beef head meat may be used in unlimited quantities and identified as \u201cbeef\u201d in meat food products unless restricted by regulatory standards for specific products as indicated in 9 CFR 319.15(a) (Chopped beef, ground beef), 319.15(b) (Hamburger), 319.15(d) (Fabricated steak), 319.81 (Roast Beef parboiled and steam roasted), 319.100 (Corned beef), 319.300 (Chili con carne), 319.301 (Chili con carne with beans), and 319.303 (Corned beef hash). The presence of pork head meat is not required to be identified on the labeling of boneless pork. However, pork cheek meat and/or pork head meat may be used in unlimited quantities and identified as \u201cpork\u201d in meat food products, unless restricted by regulatory standards as indicated in 9 CFR 319.300 (Chili con carne) and 319.301 (Chili con carne with beans). See: Policy Memo 098B dated August 1, 1990 -Cheek Meat BEEF CONCENTRATE AND SALT: Broth derived from cooking fresh beef containing 3 percent to 4 percent solids is centrifuged and evaporated to approximately 60 percent solids under vacuum. The water fraction is salted to a level of 25.5 percent of the water weight (100 lbs. concentrated stock at 60 percent will have 10.2 lbs. of salt added, making a total weight of 110.2 lbs.). There is no need for refrigeration. BEEF CONSOMME: The standard requires beef as an ingredient and a minimum protein content of at least 3 percent in the finished product. \u201cBeef stock\u201d or \u201cbeef broth\u201d (or mixture of both) may be used to comprise the beef ingredient. Additional optional ingredients are gelatin, beef extract, tomato puree, hydrolyzed plant protein, and seasoning. BEEF (Dried or Air Dried): Product name is \u201cAir Dried Beef\u201d or \u201cDried Beef.\u201d MPR 2.04:1. It is usually cured by rub and/or stitch pump followed by cover pickle for 4 to 8 weeks with several overhauls (turned over for the application of

additional cure), then placed in smokehouse or drying chambers for 3 to 10 days. BEEF FIBRIN: This is a component mixture of beef fibrinogen and beef thrombin plasma protein used to bind pieces of meat or poultry together. It is limited to 10 percent." "1. If used from seven percent of ten percent, it must appear in the product name, e.g., \u201cBacon Wrapped Beef Tenderloin Steak Formed with Beef Fibrinogen and Thrombin.\u201d Therefore, the smallest letter in the product name must be at least 1\3 size of the smallest letter in the product name. 2. If used at less than seven percent, it must be a product name qualifier, e.g., \u201cFormed with Beef Fibrinogen and Thrombin.\u201d As a product name qualifier, there is no size requirement, however, it must contiguous to the product name and be prominent and conspicuous.

Additionally, the terms \u201cBeef Fibrin\u201d or \u201cFibrin\u201d may be used in the product name as a qualifier and its components identified elsewhere on the principal display panel. In this situation, the terms \u201cBeef Fibrin\u201d or \u201cFibrin\u201d and its components are linked to each other by means of asterisks. Acceptable terminology\u2019s for the components are \u201cBeef Fibrinogen and Thrombin Plasma Protein,\u201d or

\u201cBeef Fibrinogen and Thrombin.\u201d BEEF GRAVY MIX: The product must contain at least 15 percent dried beef. BEEF MARSALA: The product must contain at least 50 percent beef.

Product contains beef cubes, Marsala wine sauce, and usually mushrooms and onions. White wine may be used, but it may not replace Marsala wine. BEEF ORIENTAL OR ORIENTAL BEEF:

The product must contain at least 12 percent meat and oriental style vegetables and sauce. The label must show true product name, e.g., \u201cBeef Oriental with Vegetables.\u201d BEEF

ROULADE: The product must contain at least 50 percent cooked meat. Usually a thin strip of flank meat wrapped around vegetables and cooked. BEEF SLICES A-LA-PIZZAIOLA: The product must contain at least 50 percent cooked beef. BEEF STROGANOFF: A dish with a creamy sauce prepared with beef cut into narrow strips or cubes and saut\u00e9ed. Product labeled

\u201cBeef Stroganoff\u201d should be prepared with a formula, which includes at least 45 percent beef, or 30 percent cooked beef." "1. The product must contain at least 10 percent

sour cream, or 2. 7.5 percent sour cream, and 5 percent wine, or 3. 9.5 percent whole milk, 2 percent sour cream, and 2 1\2 percent wine. BEEF STROGANOFF WITH NOODLES: Meat and

sauce portion must meet the standard for Beef Stroganoff. Total product shall contain no more than 50 percent cooked noodles. BEEF SUKIYAKI: The product must contain at least 30 percent meat based on total product. Consists of thinly sliced beef and various vegetables cooked in a

flavored beef stock. This is not a stew as the vegetables and components are mixed during the cooking process. Vegetables used with this food are celery, bean sprouts, leeks, onions,

mushrooms, Chinese cabbage, carrots, spinach, water chestnuts, bamboo shoots, and bean curds. BEEF TRIPE STEW: There are two versions of this product. One is of Mexican origin and

merchandised in association with the term \u201cMenudo.\u201d Corn is a prominent ingredient in its formula. The standard for an item of this nature requires that it contain not less than 33 percent beef tripe computed on the basis of the uncooked tripe in relation to total ingredients. The second product is popular in Puerto Rico. It is referred to as

\u201cMondungo.\u201d The product is made with 25 percent raw beef tripe. The remainder consists principally of potatoes, a squash with pumpkin-like appearance and flavor, and a native vegetable called \u201cTanier.\u201d When the vegetables are not distinguishable, this

product can be labeled as \u201cDominican Style Mondungo.\u201d BEEF WELLINGTON: It is made with beef tenderloin that is roasted very rare. It is then spread with a liver pate, covered

with pastry, and baked in a hot oven until pastry is brown. The product must contain at least 50 percent cooked meat and no more than 30 percent pastry. Alternatively, mushroom duxelle is an acceptable substitute for liver pate, but a true descriptive product name is required, e.g., \u201cbeef tenderloin covered with mushroom duxelle and wrapped with pastry.\u201d

BEERWURST, BIERWURST: A cooked smoked sausage. Same requirements as beef salami, with the exception that pork may be used.", "BERLINER: A cooked smoked sausage usually made from coarsely cut cured pork in large casings. When beef is used, it shall not exceed 50 percent of the meat block. Pork stomachs or beef tripe not permitted. See: Policy Memo 048 dated May 18, 1982

BERLINER BLOOD SAUSAGE: A cooked blood sausage containing diced bacon. After cooking it is dried and smoked. Ham fat, snouts, and lips are not permitted. See: Blood Sausage

BIER SCHINKEN (GR): The literal translation is \u201cBeer Ham.\u201d If product is made of all pork, it may be labeled \u201cBier Schinken.\u201d

BINDERS IN POULTRY, BONELESS, RAW OR COOKED: Binding agents may be added individually or collectively in amounts not to exceed 3 percent for cooked poultry products and 2 percent for raw poultry products based on total finished product. When binders are added in excess of these levels, the common or usual name of the binder or the generic term \u201cBinders Added\u201d shall be included in a product name qualifier, e.g., \u201cTurkey Breast-Gelatin Added.\u201d In all cases, the presence of these ingredients must be shown in the ingredients statement. This policy is intended to apply to binders which are used in chopped or chunked poultry products that are formed into rolls, loaves, etc., but not to binders added directly into whole muscle by injection, massaging, tumbling, etc., which then act as extenders. See: Policy Memo 103 dated February 13, 1987

BLOCKWURST: A semi-dry type sausage. The maximum MPR is 3.7:1.

BLOOD AND TONGUE SAUSAGE: Same as blood sausage, except cured and cooked pork or beef tongues are used.", "BLOOD SAUSAGE: A cooked sausage formulated with blood and some meat. Usually contains pork skins and\;/or pork jowls. May also contain sweet pickled ham fat, snouts, and lips. If the product does not contain meat, it must be labeled as \u201cBlood Pudding.\u201d

BOINGGHETTI: This label must show a true product name, \u201cSpaghetti with Chicken Sauce.\u201d The product must contain at least 6 percent cooked chicken meat.

BONE-IN MEAT WITH SAUCE: Must have at least 50 percent meat (cooked basis). Product with barbecue sauce must comply with 9 CFR 319.312.

BONELESS BREAST TRIMMINGS: Boneless breast trimmings (turkey or chicken) are defined as trimmings that are removed from the breast portion only. When a product is formulated with boneless breast trimmings, the amount of skin should be indicated in order to determine that the meat requirement is met for a standardized product and that the product is properly labeled. Trimmings from the ribs may be identified as white turkey or white chicken trimmings, or white turkey or white chicken rib meat (excluding skin).

BRATWURST: This is a fresh sausage product that may contain byproducts when properly declared in the ingredients statement. Vegetables, cheese and fruit are also acceptable when properly declared as part of the product name e.g., \u201ccheddar bratwurst.\u201d See: 9 CFR 319.140 Sausage Classification Sausage Type Products with Fruits and Vegetables Sausage Containing Cheese

BRATWURST, CURED: Product that meet the requirement for bratwurst but also contain cures must be labeled as \u201cCured Bratwurst.\u201d Bratwurst can be a cooked product.

BREAKFAST LINKS OR PATTIES: The names \u201cBreakfast Links\u201d and \u201cBreakfast Patties\u201d can be considered fanciful names, which must be followed by a descriptive product name. Such products are acceptable without compliance with the fresh

pork sausage or breakfast sausage standard. If the "," names \u201cBreakfast Links\u201d or \u201cBreakfast Patties\u201d are used without further qualification, the products must meet either the fresh pork sausage standard or the breakfast sausage standard.

**BREAKFASTS**

(Containing Meat): The product must contain at least 15 percent cooked meat or poultry or meat or poultry food product based on the total net weight of breakfast.

**BROTH, BEEF OR PORK:** No distinction has been made between \u201cbroth\u201d and \u201cstock.\u201d They may be used interchangeably as the resulting liquid from simmering meat and\or bones in water with seasonings. Both products have an MPR of 135.1 or a 67.1 MPR for concentrate.

**BROTWURST:** A cured and cooked sausage that may be smoked.

**BROWN AND SERVE SAUSAGE:** The standard is based on one of the four options as listed below:

1. Moisture Protein Ratio (MPR) is no more than 3.7:1, fat limited to 35 percent, and 10 percent water at formulation.
2. No more than 10 percent added water at formulation and a yield of no greater than 80 percent.
3. No more than 8.8 percent added water at formulation and a yield no greater than 85 percent.
4. Product must meet fresh sausage standard before cooking. The label must show true product name, e.g., \u201cBrown and Serve Pork Sausage.\u201d

**BROWN AND SERVE SAUSAGE (Canned):** A cooked sausage, usually without cure, and not more than 8 percent water. The weight of the sausage at canning shall not exceed weight of fresh uncured meat ingredients plus weight of curing and seasoning ingredients.

**BRUNSWICK STEW:** The product must contain at least 25 percent (fresh basis) of at least two kinds of meat, one of which may be poultry. Product must contain corn as one of the vegetables.", "See: Poultry Brunswick Stew

**BUFFALO STYLE:** Meat or poultry products that are cooked and usually coated with a mild or spicy sauce containing, Cayenne red pepper, vinegar, salt and garlic, can be labeled, \u201cBuffalo Style.\u201d It would also be acceptable on any product labeled, \u201cmade in Buffalo, NY.\u201d Buffalo wings is a fanciful term that requires a descriptive name.

**BURGUNDY SAUCE WITH BEEF AND NOODLES:** The product must contain at least 25 percent cooked beef in the product, with up to 20 percent cooked noodles. Product must contain enough wine to characterize the sauce.

**BURRITOS:** A Mexican style sandwich-like product consisting of a flour tortilla, various fillings, and at least 15 percent meat or 10 percent cooked poultry meat. The flour tortilla is rolled and may or may not have tucked ends. Fillings may contain, in addition to meat or poultry meat, such major ingredients as beans, potatoes, cheese, rice, tomatoes, and chilies. Examples of product names are \u201cBEEF BURRITO,\u201d \u201cTURKEY BURRITO,\u201d \u201cCHICKEN FAJITA BURRITO,\u201d AND \u201cCHILI VERDI WITH BEANS BURRITO.\u201d If ingredients, e.g., rice or beans, are declared in the product name, they must appear in the proper order of predominance. Ingredients cannot be mentioned in the product name unless all other ingredients present in amounts equal to or above the declared ingredient are included in the name, e.g., \u201cBEANS, BEEF, TOMATO, ONION, AND RICE BURRITO.\u201d The use of \u201cRed Chili\u201d or \u201cGreen Chili\u201d or a similar designation of the chili content in a starburst, flag, or similar display, separated from the product name, is acceptable. If such designations are used as part of the descriptive name, the presence of the chilies must appear in the correct order of predominance, and all other ingredients present in amounts equal to or greater than the chilies must appear in the product name. A claim or name that identifies the use of shredded meat or shredded poultry meat is permitted. However, if ground meat or ground poultry meat is also used, its presence must also be identified in the claim or name, e.g., \u201cShredded Beef and

Ground Beef Burrito.\u201d \u201cBURRITO\u201d alone, may be used to name the product without a descriptive name. However, the ingredients statement must appear directly beneath \u201cburrito.\u201d BURRITOS WITH SAUCE OR GRAVY: Product must contain at least 50 percent burritos.", "BUTIFARRA-SAUSAGE: An uncured sausage. Labeling that features the term \u201cButifarra\u201d would require an additional product name: Pork Sausage -for those products that meet the fresh pork sausage standard. Fresh Sausage -for those products that include byproduct but do not meet the standard for pork sausage. Sausage -for those products that are incubated or fermented. The term Puerto Rican Style would be applicable if manufactured in Puerto Rico. See: Policy Memo 002 dated May 30, 1980 CADDIES, DISPLAY CADDIES-LABELING WITH RESPECT TO THE MARK OF INSPECTION: All meat and poultry product placed inside a display caddy must be fully labeled with all mandatory labeling features of an immediate container per 9 CFR 317.2 or 381 Subpart N. Display caddies when used as a shipping container are required to bear the mark of inspection and may continue to bear the mark of inspection when used as a caddie at retail for one-time use display. Display caddies may bear other labeling features as duplicated from the approved product labeling for the product or products within the display caddy. CAJUN: Refers to product made in Louisiana. CAJUN STYLE\CAJUN RECIPE: Acceptable identification for products containing onion\onion powder\dehydrated onion, garlic\garlic powder\dehydrated garlic, white pepper, red pepper, and black pepper. CALABRESE (IT): A salami originating in Southern Italy. Usually made entirely of pork seasoned with hot peppers. CALZONE, CALZONI (IT): Turnover-like product made with dough stuffed with meat or poultry, cheese, and seasonings and baked. It must contain 25 percent meat or 14 percent poultry meat. The label must show a true product name, e.g., \u201cSausage and Cheese Calzone.\u201d CANADIAN AND CANADIAN STYLE BACON: \u201cCanadian Bacon\u201d and \u201cCanadian Style Bacon\u201d are synonymous and should not be considered geographical terms.", "The term \u201cCanadian Style Bacon,\u201d when featured on the label as a product name or part of a product name (i.e., as a description, etc.), may stand alone without an additional qualifier indicating the true geographical origin of the product. \u201cChunked and Formed\u201d and \u201cWater Added\u201d products are permitted, provided proper labeling is applied. Uncooked and\or unsmoked \u201cCanadian Style Bacon\u201d is also permitted, provided labeling describes the product as uncooked and\or unsmoked. Product which is identified as \u201cCanadian Style Bacon\u201d is made from a trimmed boneless pork loin. On the shoulder end, the cross section of the longissimus dorsi muscle shall be equal to or larger than the combined cross sectional areas of the splenius and semispinalis capitis muscles. The ham end shall be removed anterior to the ilium. The exposed faces shall be approximately perpendicular with the skin surface. The dorsal and ventral side on each end of the \u201cCanadian Style Bacon\u201d shall not be more than 1.0 inch different in length. The belly is removed adjacent to the longissimus dorsi muscle. All bones and cartilage shall be removed. The tenderloin and the flesh overlying the blade bone are excluded. The surface fat (and false lean when necessary) shall be trimmed to 0.3 inches thick at any point. The fat on the ventral and dorsal sides is neatly beveled to meet the lean. See: Policy Memo 050B dated December 19, 1985 CANADIAN STYLE BACON MADE WITH\FROM PORK SIRLOIN HIPS: The sirloin is obtained by removing a 5-to 7-inch section of the pork loin immediately in front of the hip or pelvic bone. The sirloin hip is obtained by removing the half of the sirloin which comprises the posterior end of the pork loin. The tenderloin is not included

and surface fat shall be trimmed to 0.3 inches in thickness. The labeling for these Canadian Style Bacon products must bear a qualifying statement, adjacent to the product name, clarifying that pork sirloin hips are included or that the product is made entirely from pork sirloin hips, e.g., \u201cCanadian Style Bacon--Includes Pork Sirloin Hips\u201d or \u201cCanadian Style Bacon--Made from Pork Sirloin Hips.\u201d The smallest letter in the qualifier should not be less than one-third the size of the largest letter in the product name. The qualifier must be of equal prominence to the product name. Chunked (or chopped) and formed varieties and substances controlled by the protein fat free (PFF) regulation for cured pork products 9 CFR 319.104 shall be labeled in accordance with applicable guidelines. Use of this type of product in a secondary product, e.g., a pizza, requires complete identification only in the ingredients statement; the product name of the secondary", "product need only refer to Canadian Style Bacon, e.g., Canadian Style Bacon Pizza. See: Policy Memo 116 dated July 11, 1988 CANNED CHOPPED BEEF OR PORK: Cured product with no more than 3 percent water in formula.

CANNED MEAT: \u201cCanned meat with Natural Juices;\u201d is acceptable for product that has been pumped or contains up to 10 percent of a solution before canning and processing. Processed canned uncured meat products, when water or broth is added to the can may not be called \u201cwith natural juices,\u201d but the acceptable name would be \u201cwith juices.\u201d

CANNELLONI (IT): Product must contain at least 10 percent meat or 7 percent cooked poultry meat. Cannelloni is an Italian term referring to a product with the same characteristics as \u201cRavioli\u201d except Cannelloni has a tubular form. The product name should show the type of species, e.g., \u201cBeef Cannelloni.\u201d

CANTONESE STYLE SPECIES: Marinated in a solution of soy sauce, cooked and returned weight. In addition, product is mildly seasoned with sugar, salt, wine, and spices.

CAPACOLLO, COOKED (Capicola, Capocolla, Capacola, Capicollo, Cappicola, Capacolo) (IT): Boneless pork shoulder butts which are cured and then cooked. The curing process may be dry curing, immersion curing, or pump curing. The cured product is coated with spices and paprika before cooking. This product shall always be labeled with \u201cCooked\u201d as part of the product name. Water added is permitted.

CARAMEL COLORING: Caramel is considered a natural color. However, when caramel coloring is added to a product, the product name must be qualified to indicate the presence of artificial coloring, e.g., \u201cCooked Roast Beef-Caramel Coloring Added\u201d or \u201cArtificially Colored.\u201d This requirement does not apply to gravies, sauces, and similar products where the use of such coloring is customary. Seasoning mixes containing small quantities of caramel coloring may be used if the caramel coloring does not impart color to the finished product. Caramel coloring may be used on the surface of raw products, e.g., beef patties, if the name is appropriately qualified. However, caramel coloring may not be added directly to", "the formulation of a raw product where the caramel coloring becomes an integral part of the total product. See: Policy Memo 112 dated June 6, 1988 CARBONADE (FR): Product must contain at least 50 percent meat. It may contain beef, pork, or mutton, and beer or wine. Product is slowly cooked, either by braising or stewing. Label must show a true product name, e.g., \u201cBeef Carbonade.\u201d

CARRIERS: Substances, as defined by the Food and Drug Administration, that carry flavoring compounds, e.g., essential oils, on their surface, and are not expected to provide a functional effect, e.g., binding and emulsifying, in the finished food product and are considered incidental. Some substances, e.g., maltodextrin and modified food starch, are not carriers but actually diluents or bulking agents, and must be declared in the ingredients

statement. Dextrose and\or sugar are commonly used as carriers for spice extracts and resins of spices. The carrier must be declared in the ingredients statement, except in those cases where a sweetening agent is used separately in formulating the meat or poultry product and the use of the spice mixture will not result in the quantity of the carrier being more than 0.75 percent of the seasoning mix. When a determination cannot be made from the information on the label application, declaration is required. Salt, when used as a carrier, will always be declared regardless of amount used. CASING, ARTIFICIAL: Frankfurters packaged in retail containers with the artificial casing left on must bear a prominent statement, e.g., \u201cRemove casing before eating,\u201d contiguous to the product name on the label.

CASSEROLE: Product must contain at least 25 percent meat or 18 percent cooked meat.

CASSOULET (FR): Product must contain at least 25 percent meat. A complex stew consisting of dried white beans and a combination of pork, lamb, game, and sausages. The ingredients are cooked, then put into a casserole, usually covered with crumbs, and baked. Label must show true product name, e.g., \u201cBeans and Bacon in Sauce.\u201d","CENTER SLICE: When the term \u201cCenter Slice\u201d is used on labels for slices of ham from smoked and cooked, smoked, or water cooked hams, product must be sliced from an area of the original ham positioned about 1 inch on each side of a center cut. CEREAL: Cereal is a generic term for grains from grass, e.g., wheat, rice, rye, oats, barley, and corn. All ingredients must be listed by common or usual name on labeling. However, cereal is not a common or usual name and requires a sublisting in the ingredients statement. CERTIFIED: With the exception of the term \u201cCertified Pork\u201d the term \u201ccertified\u201d implies that the United States Department of Agriculture (USDA) and the Agriculture Marketing Service (AMS) have officially evaluated a meat product for class, grade, or other quality characteristics. When used under other circumstances, the term should be closely associated with the name of the organization responsible for the \u201cCertification\u201d process (e.g., \u201cXYZ Company's Certified Meat,\u201d or \u201cOur Certified Meat\u201d). CERVELAT: A cured and cooked sausage, often a semi-dry or dry summer sausage. Hog stomachs, beef tripe and extenders are permitted. There is no MPR (moisture protein ratio) requirement. CHA SHU BOW (CH): A steamed bun with a dry roasted pork filling requiring 15 percent cooked pork. Label must show true product name, e.g., \u201cSteamed Bun with a Pork and Cabbage Filling.\u201d CHEEK MEAT, BEEF: Natural proportions are considered to be 2 percent. See: Policy Memo 098B dated August 1, 1990 See: 9 CFR 319.15 The use of cheek meat is limited to 25 percent in ground beef, chopped beef and similar type products. If cheek meat exceeds 2 percent (natural proportions), its presence must be declared.","CHEESE: 1. When cheese is declared in the ingredients statement of a fabricated product, cheddar cheese must be used in the product's formulation. 2. Swiss, Gruyere: The term \u201cGruyere\u201d pertains to a cheese that closely resembles \u201cSwiss Cheese\u201d both in its appearance and on analysis, although it has smaller holes than Swiss Cheese. FDA advises that Gruyere Cheese is a suitable substitute for Swiss Cheese and gives the same character to a finished food product, e.g., \u201cChicken Cordon Bleu.\u201d 3. The term Cheese may appear in the product name, e.g., \u201cHam and Cheese Loaf,\u201d provided the common name is declared in the ingredients statement. 4. When a cheese product and meat or poultry food product are packaged together, the product name shown on the label must show the name of each component product. For example, if slices of ham and slices of a cheese product are packaged together, the product name should include

CHA SHU BOW (CH): A steamed bun with a dry roasted pork filling requiring 15 percent cooked pork. Label must show true product name, e.g., \u201cSteamed Bun with a Pork and Cabbage Filling.\u201d CHEEK MEAT, BEEF: Natural proportions are considered to be 2 percent. See: Policy Memo 098B dated August 1, 1990 See: 9 CFR 319.15 The use of cheek meat is limited to 25 percent in ground beef, chopped beef and similar type products. If cheek meat exceeds 2 percent (natural proportions), its presence must be declared.","CHEESE: 1. When cheese is declared in the ingredients statement of a fabricated product, cheddar cheese must be used in the product's formulation. 2. Swiss, Gruyere: The term \u201cGruyere\u201d pertains to a cheese that closely resembles \u201cSwiss Cheese\u201d both in its appearance and on analysis, although it has smaller holes than Swiss Cheese. FDA advises that Gruyere Cheese is a suitable substitute for Swiss Cheese and gives the same character to a finished food product, e.g., \u201cChicken Cordon Bleu.\u201d 3. The term Cheese may appear in the product name, e.g., \u201cHam and Cheese Loaf,\u201d provided the common name is declared in the ingredients statement. 4. When a cheese product and meat or poultry food product are packaged together, the product name shown on the label must show the name of each component product. For example, if slices of ham and slices of a cheese product are packaged together, the product name should include

\u201cHam\u201d and the name of the cheese product (e.g., Ham and Pasteurized Processed American Cheese). Alternatively, the Pasteurized Processed American Cheese could be parenthetically qualified contiguous to the product name (e.g., \u201cHam and Cheese (Pasteurized Processed American Cheese)\u201d). The name \u201cHam and Cheese\u201d alone would be acceptable if the cheese used was \u201cCheddar Cheese.\u201d 5. Use of substitute or imitation cheese in products where real cheese is expected (e.g., Cordon Bleu) requires the product name be changed or qualified to indicate the presence of the ersatz cheese. Substitute and imitation cheeses cannot be described as \u201ccheese\u201d in the product name. There is no limitation on the amount of ersatz cheese used. 6. Expressed Nutrient Content Claim Standardized Cheese \u2013 FDA regulation 21 CFR 130.10 is a general definition and standard of identity rule for manufacturing and labeling of substitute cheese products where its normal counterpart is governed under 21 CFR Part 133. Such products use the name of a standardized cheese in their statement of identity but do not comply with the standard of identity because of a deviation that is described by an expressed nutrient content claim that has been defined by FDA regulation. These products must be identified on the labeling of meat and poultry products by their common or usual name which contains an expressed nutrient content claim along with the standardized name of cheese, e.g., \u201cLow Fat Cheddar Cheese.\u201d In addition, the expressed nutrient content cheese must be properly identified in the ingredients declaration by its common or usual name and a sublisting of its ingredients that display an asterisk(s) identifying an ingredient(s) in the cheese sublisting and linked to another asterisk with a statement indicating \u201cingredients not in regular\u2026\u201d and/or \u201cingredients in excess of amount permitted by\u2026\u201d The asterisk(s) and the statement in the ingredients declaration are necessary as they are part of the identity of the expressed nutrient content cheese.", "7. Cheese is a standardized product. See: 21 CFR 130.10 and 133 for a listing of standardized cheeses CHEESE (PASTEURIZED PROCESSED CHEESE FOOD OR SPREAD): A cheese food product with a standard of identity, but is not considered a cheese. Therefore, it cannot be used in meat food products where cheese is an expected ingredient, e.g., \u201cCheesefurters\u201d or \u201cVeal Cordon Bleu.\u201d It is acceptable in non-specific loaves, etc. CHEESE PRODUCTS CONTAINING MEAT: Homogeneous cheese and meat products, e.g., cheese balls with pepperoni, must contain more than 50 percent meat to be amenable to USDA inspection. Cheese products that contain 50 percent or less meat are considered products of the dairy food industry and, thus, are exempt from federal inspection. When cheese and meat are separate components in a package, the packaged product is amenable, provided, it contains 2 percent cooked meat. CHEESE STANDARDIZED PRODUCTS: Cheese standardized products that require real cheese, e.g., chicken cordon bleu, must use FDA standardized cheese or those FDA standardized cheeses specified. Use of a substitute, imitation cheese or other non FDA standard cheeses, if permitted, must be declared in the product name, or a suitable qualifier, e.g., chicken cordon bleu made with reduced fat cheese. The 90/10-cheese rule is only applicable to pizza. CHICHARRONES (PR): The Spanish name for fried pork skins. Product must have an English product name, \u201cFried Pork Skins\u201d except in Puerto Rico. CHICHARRONES de POLLO (PR): An acceptable product name for \u201cMarinated Cut-up Fried Chicken\u201d sold in Puerto Rico. When product is destined for sale only in Puerto Rico, \u201cChicharrones de Pollo\u201d can be the product name. When destined for sale in other places,

\u201cChicharrones de Pollo\u201d must be explained with true product name. CHICKEN, ALOHA: \u201cAloha Chicken\u201d is acceptable as a coined name which must be followed by a true product name, e.g., \u201cChicken and Sauce with Rice.\u201d The standard for the product is 22 percent cooked poultry meat.", "CHICKEN AND NOODLES AU GRATIN (FR): Product must contain at least 18 percent cooked chicken meat. CHICKEN CORDON BLEU (FR): Product should contain: 1. Chicken breast meat (sliced) with or without chicken skin. Marinade or solution may be included in the meat content of the product. If another part of the chicken is used, product would need to be descriptively labeled, for more information see #5 in this entry. 2. Cured pork, e.g.: ham, Canadian Style Bacon 3. Cheese or pasteurized processed cheese 4. Product can be breaded or unbreaded. If breading is used, breading is limited to 30%. 5. If any of the conditions for chicken cordon bleu are not met, the product should be descriptively labeled. Not meeting the conditions can include using uncured bacon, uncured turkey ham, cured turkey ham, imitation cheese, or some other part of the chicken than the breast. CHICKEN ENCHILADA SUIZA: The product consists of chicken enchiladas with a cream sauce. The sauce used must be made with sour cream, heavy cream, or whipping cream in an amount sufficient to characterize the sauce. The label must show a true product name, e.g., \u201cChicken Enchilada with Cream Sauce.\u201d CHICKEN OVA: These can not be used for human consumption without first going to an egg products plant for pasteurization (because of problem with potential Salmonella contamination). Chicken Ova can not use the poultry inspection legend. CHICKEN PAPRIKA: Product must contain at least 35 percent chicken. A Hungarian dish. Sauce must contain either sour or sweet cream and enough paprika to give a pink color.", "CHICKEN WELLINGTON: It is made with roasted chicken that is spread with liver pate, covered with pastry, and baked in a hot oven until pastry is brown. The product must contain at least 59 percent cooked meat and no more than 30 percent pastry. CHILI: 1. \u201cBrick Chili\u201d or \u201cCondensed Chili\u201d requires 80 percent meat. Cereal is limited to 16 percent. 2. Chili with reconstitution directions should meet the chili standard when reconstituted. 3. When beef heart meat, cheek meat, or head meat is used in excess of 25 percent of the meat block, it must be reflected in the product name, e.g., \u201cChili with Beef and Beef Heart Meat.\u201d 4. When beef appears in the product name, BEEF MAY BE THE ONLY MEAT SOURCE USED. Beef Chili may not contain beef fat or other beef byproducts. 5. \u201cChili Gravy with Meat\u201d requires at least 40 percent fresh meat and no more than 8 percent cereals. 6. Cured meats are not an expected ingredient in chili; when used, they must be shown as part of the product name. 7. The terms \u201cChili\u201d or \u201cChili con Carne\u201d may be used interchangeably. 8. Since \u201ccon carne\u201d means \u201cwith meat,\u201d products labeled as chili con carne should include only red meat and not poultry. Products which meet the chili standard and include poultry may be labeled \u201cbeef and chicken chili,\u201d \u201cbeef chili, chicken added,\u201d etc., as appropriate. The binder and extender limitation of 8 percent is based on total formulation. See: 9 CFR 319.300 CHILI COLORADO: Product must meet 9 CFR 319.300 requirements. Chili peppers must be exclusively of the red variety. If a prepared chili powder is used, it must be prepared exclusively from red chili peppers. The term \u201cColorado\u201d is used for red more than \u201cRojo\u201d in Mexico. The term \u201cRojo\u201d is used more in Spain, Puerto Rico, and Cuba. See: Policy Memo 013 dated September 12, 1980", "CHILI-MAC: Product must contain at least 16 percent meat. The label requires a true product name, e.g., \u201cBean, Macaroni and Beef in

Sauce\ud83c\udc1d. CHILI PIE: Chili component of the total product must have at least 40 percent fresh meat. CHILI PUPS: An emulsion stuffed in casing and smoked. Label requires a true product name, e.g., \ud83c\udc1dChili con Carne and Ground Beans Product.\ud83c\udc1d Product must contain at least 60 percent fresh meat in total formulation. CHILI RELLENO: Product must contain at least 12 percent fresh meat and be coated with a batter and then fried. Sometimes product is called \ud83c\udc1dChili Pepper Relleno.\ud83c\udc1d Relleno means stuffed. CHILI SPAGHETTI: Product must contain at least 16 percent meat. CHILI SAUCE WITH MEAT: Product must contain at least 6 percent meat. CHILI VERDE (SP): Product must meet 9 CFR 319.300 requirements. Chili peppers must be exclusively of the green chili or Verde chili pepper varieties. If a prepared chili powder is used, it must have been prepared exclusively from green chili or Verde chili peppers. Products, e.g., \ud83c\udc1dChili Verde with Beans\ud83c\udc1d shall comply with 9 CFR 319.301 and the above requirements for \ud83c\udc1dChili Verde.\ud83c\udc1d See: Policy Memo 013 dated September 12, 1980 CHILI WITH BEANS: 1. \ud83c\udc1dBrick Chili with Beans\ud83c\udc1d or \ud83c\udc1dCondensed Chili with Beans\ud83c\udc1d requires 50 percent meat and cereal is limited to 16 percent. 2. Chili with Beans with reconstitution directions should meet the Chili with Beans standard when reconstituted.", "3. When beef heart meat, cheek meat, or head meat is used in excess of 25 percent of the meat block, it must be reflected in the product name, e.g., \ud83c\udc1dChili with Beef and Beef Heart Meat with Beans.\ud83c\udc1d 4. When beef appears in the product name, beef may be the only meat source used. Beef Chili with Beans may not contain beef fat or other beef byproducts. 5. Cured meats are not an expected ingredient in Chili with Beans; when used, they must be shown as part of product name. 6. \ud83c\udc1dChili with Beans\ud83c\udc1d formulae usually contain up to 25 percent of beans in a product. About one-fourth of these beans may be incorporated in the product as ground beans and should be listed in the ingredients statement as ground beans. 7. The terms \ud83c\udc1dChili with Beans\ud83c\udc1d or \ud83c\udc1dChili con Carne with Beans\ud83c\udc1d may be used interchangeably. 8. The binder and extender limitation of 8 percent is based on total formulation. See: 9 CFR 319.301

CHIMICHANGA: Product must contain at least 15 percent meat or 10 percent poultry meat. A Mexican specialty from the State of Sonora. Like burritos, product is made by wrapping a flour tortilla around a filling; but unlike the burrito, chimichanga is fried until brown and crisp. \ud83c\udc1dFried Burritos\ud83c\udc1d is acceptable.

CHINESE BRAND LINKS: Raw nonspecific sausage-like products. These products are permitted to contain artificial red coloring; however, if pork is used it must be certified. Unlike the term \ud83c\udc1dlinks,\ud83c\udc1d \ud83c\udc1dChinese Brand Links\ud83c\udc1d is considered a coined or fanciful name, and [as a] nonspecific product, it must be accompanied by an ingredients statement. Furthermore, \ud83c\udc1dmade in USA\ud83c\udc1d must be contiguous to the word \ud83c\udc1dbrand\ud83c\udc1d but cannot intervene between \ud83c\udc1dlinks\ud83c\udc1d and the ingredients statement.

CHINESE PEPPER STEAK: A Chinese main dish, usually served with rice, must contain at least 30 percent cooked beef. Beef steak is cut into thin strips, browned in fat or oil, and added to a soy flavored sauce. Vegetables are also added to the sauce. Green pepper strips are always used and other vegetables may be included.", "CHINESE STYLE BARBECUE MEAT: Acceptable identification for barbecued meat (9 CFR 319.80) product that is flavored with a solution with soy sauce, grain alcohol or dry sherry wine, and a sweetener, that is, sugar or honey. Other ingredients may include garlic or scallions, ginger or ginger juice, sesame or peanut oil. The product may be artificially colored. If artificially colored, a qualifier is needed.

CHINESE STYLE BEEF: Product must contain grain alcohol and soy sauce. CHINESE STYLE

**SAUSAGE:** Product must contain grain alcohol and soy sauce. **CHIPPED BEEF:** Beef that is dried, chipped, or sliced and may be cured or smoked. An MPR 2.04:1 is required. It may be chunked, ground, chopped, and formed. If so, the product name must be qualified, e.g., \u201cChipped Beef, Chunked and Formed.\u201d Acceptable fill: 1. 2 oz. in a 4 fluid oz. glass, or 2. 2 1\2 oz. in a 5 fluid oz. glass, or 3. 5 oz. in a 9-5\8 fluid oz. glass. **CHITTERLINGS:** Approved label must identify the species of food animal from which the product is derived. Hog bungs may be labeled \u201cPork Chitterlings.\u201d The purge under normal conditions should not exceed 20 percent of the net weight of frozen chitterlings. See: 9 CFR 317.8(b)(30) **CHOICE GRADE, FANCY GRADE POULTRY:** \u201cChoice\u201d or \u201cFancy\u201d may not be used in conjunction with \u201cGrade\u201d on poultry labels. These terms and others like \u201cPrime\u201d and \u201cTop Quality\u201d on poultry labels indicate only that product is equal to U.S. Grade A. **CHOPPED CHICKEN LIVERS:** Total product must contain at least 50 percent cooked chicken livers. Wheat flour and similar ingredients are acceptable.," **CHOPPED CHICKEN LIVERS COMBINED WITH OTHER CHARACTERIZING COMPONENTS:** Product must contain at least 30 percent cooked livers, e.g., \u201cChopped Chicken Livers with Eggs and Onions\u201d. **CHOPPED HAM:** A total of 15 percent shank meat is permitted. This is 3 percent above the normal proportion of 12 percent shank meat found in a whole ham. See: 9 CFR 319.105 **CHOP SUEY, AMERICAN:** Product must contain at least 25 percent fresh meat in total formulation. A stew-like dish prepared with beef, pork, or veal. Vegetables include onion and celery. Macaroni, noodles, or rice are usually incorporated in the product, although recipes suggest serving chop suey over one of these. **CHOP SUEY (VEGETABLES WITH MEAT):** Product must contain at least 12 percent fresh meat. **CHORIZO (SP):** The product name \u201cChorizo\u201d can be used for any type of chorizo sausage that is cooked, dry, semi-dry, cured and fresh without further product name qualification. Other requirements for various types of chorizo apply, including the sausage standard. It is seasoned with Spanish pimento and red pepper. Partially defatted pork fatty tissue is acceptable in Chorizo. Wine is considered a flavoring and need only appear in the ingredients statement. However, the liquid is credited as added water. **CHORIZO, FRESH:** These products may contain vinegar. The vinegar used must have a strength of no less than 4 grams of acetic acid per 100 cubic centimeters (20o C.). Policy Memo 034 dated October 1, 1981 **CHORIZO IN LARD:** Product must contain at least 55 percent chorizo.," **CHORIZO IN LARD, CANNED:** Canned chorizos that are packed hot, usually in lard, and are not thermally processed must have a moisture protein ratio of 1.8:1 and a pH of not more than 5.5. An alternative standard is a water activity (Aw) of 0.92. **CHOW MEIN WITH MEAT:** Product must contain at least 12 percent fresh meat. **CHULENT (CHOLENT):** Product must contain at least 25 percent fresh meat. A meal-in-one dish of Jewish cuisine made in various ways. The product name can stand without qualification. **COARSE GROUND MEAT TRIMMINGS:** Coarse ground trimmings may be shipped from an establishment without meeting the 30 percent fat limitation if a specific fat content is declared, e.g., \u201cCoarse Ground Beef Trimmings-40 percent fat beef.\u201d If the labeling terminology is \u201cCoarse Ground Beef\u201d or \u201cGround Beef\u201d, the 30 percent fat limitation shall apply. **COLORED CASING:** Colored casings on meat and poultry products which do not transfer color to the product, but which change and give a false impression of the true color of the products, must be labeled to indicate the presence of the casings. Acceptable terminology includes \u201cCasing Colored\u201d or \u201cArtificially Colored.\u201d These phrases must appear

contiguous to the product name. Casings which are the same color as the product and not misleading or deceptive, e.g., a white opaque casing on a summer sausage, do not have to be so labeled. Also, products consisting of whole muscle bundles, e.g., hams, pork butts, etc., packaged in colored wrappings where a cut surface is not visible through the casing are exempt. The color agent must be specifically identified on the label either in the product name qualifier or ingredient statement. See: Policy Memo 095 dated February 27, 1986 See: 9 CFR 319.15(d)

**COMPOSITE INGREDIENTS STATEMENT:** Processors who use a multi-ingredient product, e.g., pepperoni from various sources, as an ingredient, may identify all the ingredients that may be present from all the various formulations (i.e., a composite ingredients statement). However, the ingredients", "identified as those that may be present can only be those ingredients that are minor in nature and cannot include ingredients, e.g., the meat component that have a bearing on the overall characteristics or value of the product. The minor ingredients must be identified using one of the following examples of acceptable formats: 1. pepperoni (pork, beef, water, salt, spices, sodium nitrite. May also contain lactic acid starter culture, sugar, and sodium ascorbate). 2. bacon bits (cured with water, salt, dextrose and\or sugar, sodium nitrite). 3. pepperoni, pork, beef, water, sweeteners (contains one or more of the following: sugar, dextrose, fructose, corn syrup), salt, spices, sodium nitrite). Labeling records must identify all the ingredients of each type of component that is used so the accuracy of the composite ingredients statement can be determined. All labeling for meat and poultry products must either comply with this type of format or, alternatively, accurately list all ingredients used in the product. See: Policy Memo 072 dated May 18, 1984

**COOKED BEEF, EQUIVALENCY:** In lieu of fresh beef, a 70 percent yield figure is used if no yield information is provided. See: FSIS Directive 7124.1 Table 2

**COOKED BREAKFAST SAUSAGE:** Antioxidants are permitted when product is formulated on a raw basis (no more than 3 percent water).

**COOKED RED MEAT PRODUCTS CONTAINING ADDED SOLUTIONS:** Cooked corned beef products and cooked cured pork products not addressed by the cured pork products regulation (9 CFR 319.104, 319.105), that weigh more than the weight of the fresh uncured article, may be prepared if they are descriptively labeled to indicate the presence and amount of the additional substances.

Acceptable product names include: \u201cCooked Corned Beef and X % Water\u201d or \u201cCooked Cured Pork and Water Product, X % of Weight is Added Ingredients,\u201d and \u201cCooked Pastrami and Up to 20 % of a Solution.\u201d The ingredients of the solution may accompany the product name or appear in locations prescribed for ingredient statements. Product name prominence guidelines are found in Policy Memo 087A (on Word Size in Labeling of Product Names and Fanciful Names) and Policy Memo 109 (on Labeling Prominence Guidelines for Cured, Cooked Products with Added Substances That Do Not Return to Green Weight). If product name qualifiers, such as \u201cX % of Weight is Added Ingredients,\u201d are used, the labeling prominence guidelines used for cured pork products as found in 9 CFR 319.104(b) apply." , "Uncured red meat products that weigh more than the weight of the fresh article after cooking should be labeled with a qualifying statement indicating the amount of solution remaining after cooking, for example, \u201cAfter cooking, contains X % of a seasoning solution of . . .\u201d The ingredients of the solution may accompany the qualifying statement or appear in locations prescribed for ingredient statements. The qualifying statement must be one-fourth the size of the largest letter in the product name. If the ingredients of the solution accompany the qualifier, they must appear in print one-eighth the size of the most prominent

letter in the product name. Other labeling prominence guidelines are found in Policy Memo 087A (Word Size in Labeling of Product Names and Fanciful Names). If cooked, uncured red meat products that contain added solutions prior to cooking are cooked back to or below the weight of the fresh (green weight) article, words, such as \u201cseasoned\u201d and \u201cflavored,\u201d are to be used to reflect the addition of the added substances, for example, \u201cSeasoned Cooked Beef.\u201d For cooked products, the % added solution for the label statement is determined by subtracting the fresh (green) weight of the article from the weight of the finished cooked product, (that is, after injecting, marinating, etc., and cooking), dividing by the weight of the finished product, and multiplying by 100. This policy is intended to apply to solutions that impart favorable flavor and other sensory characteristics, but not to solutions containing ingredients used to extend a product, such as isolated soy protein and carrageenan. Nonstandardized, raw red meat products containing added solutions must comply with 9 CFR 317.2(e)(2). See: Policy Memo 084A dated November 30, 1994 (Cooked Red Meat Products Containing Added Substances) CORN DOG OR KORN DOG: A coined name which must be accompanied by a true product name, e.g., \u201cBatter Wrapped Franks on a Stick.\u201d Product is limited to 65 percent batter and a minimum of 35 percent frankfurter. CORN DOG OR KORN DOG (POULTRY): \u201cCorn Dogs\u201d made from poultry cooked sausage, e.g., poultry franks or poultry frankfurters, must show the \u201ckind\u201d of poultry used in conjunction with the coined name \u201cCorn Dogs,\u201d e.g., \u201cChicken (or Turkey) Corn Dogs.\u201d The \u201ckind\u201d name should be shown in type size at least one-third the size of the largest letter of the coined name. A descriptive name, e.g., \u201cBatter Wrapped Chicken Frank on a Stick,\u201d must accompany the coined name. If the descriptive name is at least one-third the size of the coined name, the \u201ckind\u201d name need not precede the coined name. See: Policy Memo 061A dated September 16, 1985", "CORN MEAL MUSH WITH BACON: Product must contain at least 15 percent cooked bacon. CORNED BEEF AND CABBAGE: Product must contain at least 25 percent cooked corned beef. CORNED BEEF (Canned, Cooked with Natural Juices): Canned product labeled \u201cCooked Corned Beef with Natural Juices,\u201d is limited to 10 percent added solution before cooking. If the added solution is greater than 10 percent, the label must indicate the total added solution, e.g., \u201cCooked Corned Beef and Water product-X percent of weight is added ingredients.\u201d See: Cooked Corned Beef Products With Added Substances CORNED BEEF, GRAY: Gray corned beef is not a cured product but one that contains water, salt, sugar, flavorings, etc. It should be labeled as \u201cGray Corned Beef,\u201d \u201cGray Corned Beef Rounds,\u201d etc. The label must show an ingredients statement rather than a curing statement as shown on other corned beef labels. CORNED BEEF WITH JUICES: Uncooked corned beef with juices (or without juices and spices) is unacceptable terminology for corned beef products meeting standards in 9 CFR 319.101 and 319.102 for corned beef brisket and corned beef round (and other cuts). The presence of free flowing juices in a package does not change this policy. The net weight includes free flowing juices. COTECHINO (IT): Pork skin sausage. Meat and meat by-products other than pork skin can be used in this product. It could also be given the name of pork skin sausage in parentheses as a common name. Italian sausage. A variety of cooked sausage. See: 9 CFR 319.140 COUNTRY: A geographical term that refers to an unincorporated area. To use country, the product must be made in the country.", "COUNTRY FRIED: Refers to a fried product that is usually breaded. It is not considered a geographical

term. COUNTRY OF ORIGIN: Statement, \u201cProduct of \u2026\u2026\u2026.\u201d need only appear beneath the product name on the Principal Display Panel on imported product.

COUNTRY STYLE CHICKEN: Cut up chicken in which the wishbone is left whole.

COUNTRY STYLE (FARM STYLE) SAUSAGE: When sausage products are labeled \u201cfarm style\u201d or \u201ccountry style,\u201d they must be prepared with natural spices with the exclusion of oleoresins, essential oils, or other spice extractives. Sugar is the sweetening agent for \u201cfarm style\u201d or \u201ccountry style.\u201d HVP, MSG, and antioxidants are permitted ingredients. Products so labeled are not necessarily prepared in the country (on the farm) but are expected to have these characteristics. See: 9 CFR 317.8(b)(2) Manual 19.3(a)

CREAMED BEEF (Chipped or Dried): Product must contain at least 18 percent dried beef. It may be produced using a cured beef, or beef product which has been chopped, pressed, or cooked.

CREAMED CHEESE WITH CHIPPED BEEF: Product consists of cream cheese, chipped beef, cream and chopped onions. The meat component must be at least 12 percent of the total formulation.

CREAMED SAUCE WITH MEAT OR CREAMED MEAT PRODUCTS (Chipped Beef, Cooked Beef, Sausage, Ham, Franks, Meatballs, Etc.): Product must contain at least 18 percent meat or meat products (on a cooked basis). The kind of meat product used should be reflected in the product name (e.g., \u201cCreamed Cured Beef, Chopped, Pressed, Cooked\u201d).

CREOLE STYLE: Term applies to many dishes made with tomatoes, spices, and green peppers. Spices include onion, garlic, bell pepper, white pepper, red pepper, black pepper, parsley, and other Louisiana seasonings, e.g., bay leaf, fil\u00e9, paprika, or pepper sauce." ,

"CREPE FILLING: Must contain at least 40 percent cooked meat or 20 percent cooked meat if filling has one other characterizing ingredient, e.g., cheese, and at least 14 percent cooked meat when the filling has two other characterizing ingredients, e.g., cheese and mushrooms. This is based on the total weight of the filling.

CREPES: Product must contain:

- At least 20 percent cooked meat when the filling contains no other major characterizing component.
- At least 10 percent cooked meat when the filling contains one other major characterizing component (e.g., cheese).
- At least 7 percent cooked meat when the filling contains two or more other major characterizing components (e.g., cheese and mushrooms).

These percentages are based on the total weight of the product.

CROISSANT: A crescent shaped roll requiring 18 percent cooked meat. Label must show a true product name, e.g., \u201cCroissant with a ham and cheese sauce filling.\u201d

CROQUETTE: Product must contain at least 35 percent cooked meat, based on total formulation. Beef, ham, etc., must appear as part of the product name.

CURDLAN: A substance identified by the common or usual name \u201ccurdlan\u201d has been approved for use in foods (see 12/16/1996 Federal Register), and for non-standardized meat products, poultry products, and in Policy Memo 123 and 121B products as a binder/stabilizer/thickener/texturizer.

CURED MEAT PRODUCTS -Labeling of Mechanically Reduced: The traditional names of cured meat products, e.g., bacon, may be used even though mechanical reduction-like chopping or chunking has taken place before the product has acquired the characteristics expected of the product, provided the finished product acquires the characteristics expected. Furthermore, the mechanical reduction must be", "noted in the product name or in a qualifier to the product name (e.g., chopped bacon or bacon-chopped and formed). See: Policy Memo 033 dated September 4, 1981

CURED MEAT PRODUCTS -Packed in Brine: Cured meat products, e.g., pork tails, pork snouts, and cured boneless beef brisket, that contain 120-200 PPM nitrite and are packed and sold in brine solution, do not require a

handling statement, e.g., \u201cKeep Refrigerated,\u201d provided the finished product has at least 10 percent brine concentration, and the packing medium contains a sufficient quantity of salt to maintain the 10 percent brine concentration in the product. CURED PORK BELLIES: Such products are assumed to be further processed into bacon. Therefore, cured pork bellies must meet the restricted ingredients requirement for bacon. CURED PORK: Cured pork products, that contain modified food starch, X percent solution ISP, carrageenan or sodium caseinate, that fall into the PFF value of \u201cHam, Water Added\u201d and the \u201cHam and Water product X percent solution\u201d category, must be labeled with the appropriate PFF Nomenclature, Descriptive Labeling, e.g., \u201cham, water and binder product,\u201d will be used if: 1. binders are at levels above those permitted by the regulations 2. binders other than those permitted are used 3. two or more binders are used in combination or 4. if the PFF value of the finished product falls in the \u201cham\u201d or \u201cham with natural juice\u201d category which do not permit binders. CURED TURKEY THIGH MEAT: A product labeled \u201ccured turkey thigh meat\u201d (without turkey ham in the name) must follow the turkey ham standard. The product \u201ccured turkey thighs\u201d (which includes skin and bone), is not required to meet the standards for turkey ham and cannot be labeled \u201cturkey ham.\u201d CURRIED SAUCE WITH MEAT (POULTRY) AND RICE CASSEROLE: Product must contain at least 35 percent cooked meat or poultry meat based on the sauce and meat portion only.", "CURRY PRODUCT: 1. Meat Curry-Must contain at least 50 percent meat (lamb, beef, etc.) 2. Poultry Curry-Must contain at least 35 percent cooked poultry meat. CUTLET, BEEF: Beef cutlet may be chopped and formed. CUTLET, PORK: \u201cPork Cutlet\u201d may consist of pork temple meat, inside masseter muscles, and small pieces of lean from the tip of pork jaws. These are flattened and knitted together in \u201ccutlet\u201d size products by means of \u201ccubing\u201d or \u201cFrenching\u201d machines, or by hand pounding with \u201ccubing hammers.\u201d The term \u201ccutlet\u201d relates to thin slices of meat. They can be identified as sliced pork meat product when the designation clearly states the specific part of the carcass from which the meat in the product is derived (e.g., \u201cPork Loin Cutlets\u201d). All of the terms should be conspicuously displayed on labels. CUTLET, POULTRY: Poultry cutlets may be fabricated as opposed to using whole pieces of poultry meat. However, the term \u201ccutlet\u201d must be properly and distinctly qualified to describe the product, e.g.: \u201cTurkey Cutlet From a Turkey Loaf\u201d \u201cChicken Cutlet From Chicken Roll\u201d \u201cTurkey Cutlet, Chopped and Formed\u201d Cooked poultry cutlets, which are solid pieces and contain added water, should not be labeled as patties. A solution statement is not needed. CUTLET VEAL: Must be a solid piece of meat from the round; slice thickness may vary. However, combining several thin slices to represent a single cutlet is not permitted. DEHYDRATED MEAT CALCULATION FACTOR: The fresh meat equivalent based on a given amount of dehydrated meat can be found by multiplying the weight of the dehydrated beef by the factor 2.8. This factor was derived as follows: Assuming cannery and cutters grade beef was used, the composition of meat would be approximately 12 percent fat, 18 percent protein, 69 percent water, and 1 percent ash. Then 100 pounds of beef, when dehydrated to 5 percent moisture, would be 100 less 64 or 36 pounds dehydrated meat. Thus, 100 divided by 36 equals 2.8.", "Assuming that the amount of dehydrated beef equivalent of 100 pounds of fresh beef is that quantity containing 18 pounds of protein, then 18 divided by the percentage of protein found by analysis of dehydrated beef would be the amount of dehydrated beef

equivalent to 100 pounds of fresh meat.

**DEHYDRATED POULTRY CALCULATION FACTOR:** The moist deboned cooked poultry or poultry meat equivalent based on a given amount of dehydrated poultry or poultry meat which can be found by multiplying the weight of the dehydrated poultry or poultry meat by the factor of 4.0.

**DEHYDRATED PRODUCTS WHEN WATER IS ADDED:** Three methods are acceptable for listing dehydrated products. Listing of the ingredients (1) As \u201cwater, dehydrated potatoes\u201d or \u201cdehydrated potatoes, water,\u201d whichever is the proper order, (2) As \u201creconstituted potatoes,\u201d or (3) As \u201crehydrated potatoes.\u201d If the reference was to meat instead of potatoes, the word beef, pork, or whatever was appropriate would be substituted for the word \u201cpotatoes.\u201d

**DEVILED POULTRY:** Is a semi plastic cured poultry food product made from finely comminuted poultry in natural proportions and containing condiments. Deviled poultry may contain poultry fat, provided that the total fat content shall not exceed 35 percent of the finished product and the moisture content shall not exceed that of the fresh unprocessed poultry. When skin is in excess of natural proportions, skin must be included in the product name (e.g. \u201cDeviled (Kind) with (Kind) Skin Added\u201d).

**DINNER DOG:** A coined name - must show true product name, e.g., \u201cA Meat and Soy Protein Concentrate Product.\u201d

**DINNERS AND SUPPERS, FROZEN:** Frozen products labeled as \u201cdinner\u201d or \u201csupper\u201d must weigh at least 10 ounces and shall contain at least 3 components consisting of the following: meat, poultry, cheese, eggs, vegetables, fruit, potatoes, rice or other cereal-based products (other than bread or rolls). This is not intended to include products like casseroles and stews that have all of the components combined. Sauces and gravies are not considered one of the components. They may also contain other servings of food, e.g., soup, bread or rolls, appetizer, beverage, and dessert, and these components may be included in the minimum 10-ounce net weight requirement. If meat is featured in the product name, e.g., Beef Dinner, the requirement is 25 percent or 2.5 ounces cooked meat. If a meat food product is featured in the product name, e.g., Beef Burgundy Dinner, then 25 percent or 2.5 ounces of meat", "food product is needed. If poultry is featured in the name, e.g., Chicken Dinner, the standard is 18 percent or 2 ounces cooked deboned poultry meat, whichever is greater. However, if a poultry food product is featured in the product name, e.g., Chicken a La King Dinner, the 25 percent or 2.5 ounces of poultry food product, whichever is greater, is needed. The meat requirement for products with net weights greater than 10 ounces may be established exclusive of the appetizer, bread, and dessert, provided the remaining components weigh not less than 10 ounces. The name for dinner and supper products shall consist of or include a listing of each of the dish components in descending order of predominance by weight, for example, Fried Chicken Dinner -Fried Chicken, Mashed Potatoes, Peas and Carrots. Dinner or supper identification may appear on side panels without the complete product name shown, for example, \u201cFried Chicken Dinner\u201d or \u201cBeef Dinner.\u201d When a dessert is one of the components of a frozen dinner or supper, i.e., a multicomponent item, it may appear out of the order of predominance in the product name and appear as the last component in the product name.

**DIXIE BACON:** True product name, e.g., \u201cPork Jowl Dixie Bacon, Cured and Smoked\u201d shall appear on the label.

**DIXIE SQUARE:** Same as for Dixie Bacon.

**DOG FOOD:** See: 9 CFR 355.29

**DOUGH CONDITIONER:** A generic or class name that cannot stand alone in the ingredients statement. The term \u201cDough Conditioner\u201d must be followed immediately by the common or usual name of all ingredients present."

**DRIED EGG**

**WHITE ADDED:** See: Wheat Gluten DRIED SOUP MIXES (MEAT): Dried meat soups are not amenable. Poultry -See: 9 CFR 381.15 **DRY AGED:** Fresh Meat is held (without vacuum packing) for various periods of time (usually 10 days to 6 weeks) under controlled temperatures (34o F to 38o F), humidity, and airflow to avoid spoilage and ensure flavor enhancement, tenderness, and palatability. There is a difference of opinion regarding the best cooler humidity. Some prefer low humidity of from 70 to 75 percent so that exposed surfaces of meat remain dry. Others use humidity\u2019s up to 85 to 90 percent in order to purposely develop a mold growth on the outside of the meat and reduce evaporation losses. Ultraviolet light may be used to reduce microbial load in the aging room. The number of days aged does not have to appear on the label when the product is identified as \"Dry Aged\" (e.g., \"Dry Aged Beef.\") **DRY CURED:** Product labeled as \"dry cured\" shall not be injected with a curing solution or processed by immersion in a curing solution. **DRY MILK PRODUCTS:** Approved dry milk items include whole dry milk, nonfat dry milk, calcium-reduced dried skim milk, dried whey and lactose-reduced dried whey. If nonfat dry milk is reconstituted prior to addition to product, it would be declared on the label as \"Reconstituted Skim Milk.\" **DRY SALT CURED:** Dry salt cured product may contain a curing solution injected directly into the tissue but not through the circulatory system before it is covered with a dry curing mixture. It may be momentarily moistened to facilitate initial salt penetration but cannot be immersed in a curing solution.", "DUAL WEIGHT REQUIREMENT FOR STUFFED POULTRY LABELS: Poultry products that consist solely of bone-in poultry and stuffing, e.g., a \"Stuffed Turkey,\" shall bear weight statements on the label indicating the total net weight of the product and a statement indicating the minimum weight of the poultry in the product. When a stuffed poultry product is a component of a dinner or an entree, only the total net weight needs to be shown on the label. See: Policy Memo 018A dated December 26, 1985 **DUCK, SALTED:** This product should reach an internal temperature of 155o F. **DUMPLINGS WITH BEEF:** The product must contain at least 18 percent meat in total formulation. **DUTCH BRAND LOAF:** A nonspecific loaf that must be qualified as \"Made in USA.\" **EASTER NOLA:** Salami that is made with pork that is coarsely chopped and mildly seasoned with black pepper and garlic. **EGG FOO YOUNG WITH MEAT:** The product must contain at least 12 percent meat. **EGG FOO YOUNG WITH POULTRY:** The product must contain at least 3 percent poultry meat. **EGG ROLL, VIETNAMESE STYLE:** The product must contain soy bean noodles or cellophane noodles, and fish sauce or anchovy extract. They are usually rolled in a thin spring roll skin or a dry rice paper skin. **EGG ROLL WITH MEAT:** The product must contain at least 10 percent meat.", "EGG ROLL WITH POULTRY: The product must contain at least 2 percent poultry. **EGGS BENEDICT:** The product must contain at least 18 percent cured smoked ham. A poached egg on a toasted English Muffin, topped with a slice of ham, and covered with hollandaise sauce. **EGGS, FRESH:** For breakfast-type foods the egg portions may be referred to in the product name and the ingredients statement as \u201cFresh U.S. Grade A Large.\u201d The eggs must be received in shells or broken and blended and not in dry or frozen form. **EMPANADILLAS (SP):** A turnover containing 25 percent fresh meat or poultry (raw basis). The species or kind is part of the product name, e.g., \u201cBeef Empanadillas.\u201d The product may vary in size from large to hors d'oeuvre size. **EMPANADILLAS CHORIZO:** An empanadilla that contains at least 25 percent fresh chorizo or 17 percent dry chorizo. **ENCAPSULATION:** An encapsulated additive, e.g., salt is an acceptable name. It does not require a sublisting if encapsulated in vegetable oil. If encapsulated in an

animal fat, the specific animal fat must be identified in the ingredient statement. Encapsulated lactic acid starter culture does not need to be sublisted.

**ENCHILADA (SP):** The product must contain at least 15 percent meat or 10.5 percent poultry meat. A Mexican type food consisting of a tortilla which has been filled with a variety of fillings and then rolled. The species must appear in the product name, e.g., Beef Enchilada.

**ENCHILADA WITH BEEF CHILI GRAY OR ENCHILADA PREPARED WITH MEAT AND SAUCE:** The product must contain at least 50 percent Enchilada.

**,"ENCHILADA -Sonora Style:** The product consists of two or more tortillas stacked pancake style with filling spread between each tortilla. Cheese may be mixed into the tortilla dough prior to frying.

**ENTREE (Principal Dish or Main Course):** Product labeled entree should fall into one of the following categories:

1. All meat or meat food product -100 percent meat or meat food product.
2. Meat or meat food product and one vegetable; or meat or meat food product and gravy -50 percent cooked meat or meat food product.
3. Meat and Vegetable with Gravy -30 percent cooked meat portion; meat and gravy portion at least 50 percent, (e.g., Salisbury Steak with Potatoes and Gravy).
4. Meat or Entree portion of a meal type products -25 percent cooked meat or meat food product, (e.g., Meat Loaf Dinner would require 25 percent meat loaf).

**ENZYME TREATED PRODUCT:** Product from carcasses of animals injected with papain; liver, heart, tongue, cheek and head meat, trimmings, boneless beef, tenderloin, tails, tripe and cuts of meat not showing an imprint of the roller brand reading, tenderized with papain, shall be properly identified and kept separate from other product. Kidneys must be segregated and properly labeled. When such product leaves an official establishment, the immediate container shall bear a label showing, in addition to the other required labeling, a statement like tenderized with papain prominently displayed contiguous to the product name. The establishment will furnish retail dealers handling such product with labels bearing the statement, tenderized with papain prominently displayed contiguous to the product name for use by such dealers on consumer packages or on product prepared from carcasses of animals injected with papain. Inspection personnel visiting retail markets should observe the effectiveness of this requirement. When retail outlets do not follow this identification, these facts should be immediately reported to the Food Labeling Division.

**ENZYME TRIMMINGS FROM ANTE-MORTEM INJECTED BEEF:** Beef trimming from this operation may be used in fresh meat products without label declaration.

**,"ENZYMES -PROTEOLYTIC:** A 3 percent limit permitted pickup on dipped items, e.g., steak and solid pieces of meat. The label must declare the presence of the enzyme, e.g., Tenderized with Papain.

**,"u201d Trimmings from this method may be used in fresh meat products up to 25 percent of the formula, provided the finished product is immediately frozen and that distribution is limited to institutional use only.**

**The labeling record should state the conditions and means of inspection control.** Meat from this method may be used in cooked ground beef products up to 25 percent of the formula without showing the ingredients of the solution. See: 9 CFR 317.8(b)(25) 9 CFR 424.21 9 CFR 381.120

**EXOTIC\NON-AMENABLE PRODUCTS-USE OF CURE AGENTS:** Only amenable meat\poultry products can contain curing agents (i.e., nitrites etc.), with the exception of ratites (ostrich, rhea, emu) and squab. The prior function of nitrite and nitrate, according to FDA regulations, applies only to those species that were considered meat\ or \cpoultry\ prior to September 1958. Therefore, amenable species that can contain cure agents are identified as the following:

1. Poultry \u2013 (domesticated birds) chicken, turkey, duck, geese,

and guineas. 2. Meat \u2013 cattle, sheep, swine, and goat. Non-amenable products, such as buffalo, reindeer and pheasant, can not contain curing agents; such products are considered to be regulated under FDA regulations. However, if non-amenable products are included in an amenable product, curing agents would be permitted. The curing agents would be calculated based on both the amenable meat\poultry product and non-amenable meat\poultry product. For example, the formula includes 3 lbs. Cooked chicken and 97 lbs. buffalo. The calculation for the curing agents would be based on 100 lbs. of meat. In addition, in those situations where the meat block consists of an amenable product and a nonamenable product (refer to the example), the appropriate inspection legend should represent the amenable product. Therefore, using the example above, the label would have a poultry legend. Product derived from exotic\non-amenable species that contain over 3 percent raw meat (cattle, sheep, swine, goat, horses or other equine) are subject to inspection. The game meat used in these products must be derived from carcasses slaughtered under the Food Safety and Inspection Service. Products made with meat from exotic and non-amenable exotic species with 3 percent or less of meat or edible portion from cattle, sheep, swine, goat, horses or other equine, or up to 30 percent fat from these species are non-amenable provided the only reference to meat or meat byproducts on the labeling is in the statement of ingredients and the product name includes the term \u201cflavored with (amenable species).\u201d",---- Custom prepared products composed of meat from exotic\Nonamenable species and up to 30 percent animal fat are not amenable. Labeling such products with the term applies (see: 303.1 (a) (2)). Products made with meat from game animals with 3 percent or less of meat or edible portion from cattle, sheep, swine, goat, or up to 30 percent meat fats provided the only reference to meat or meat byproducts on the labeling is in the statement of ingredients or referred to as \u201cflavored with.\u201d Custom prepared products composed of meat from game animals and up to 30 percent animal fat. Labeling \u201cNot For Sale\u201d applies. See: 303.1 (a)(2) Buffalo and venison must be federally or state inspected; however, venison may also be produced under the supervision of inspection officials of a country approved to export meat products into the United States. All other meat from exotic\Nonamenable species that is used in formulating amenable products must be derived from carcasses slaughtered under the Food Safety and Inspection Service. EXTRA AND MORE THAN: The terms \u201cextra\u201d or \u201cmore (component) than\u201d may be used provided the following guidelines are followed: (1) There is at least a 10 percent increase in the particular component of interest over the amount that is found in the usual or \u201cregular\u201d formulation. (2) Information must be provided with the label application that compares the product formulation containing the \u201cextra\u201d amount of the component to the regular formulation of the same product to establish that at least a 10 percent increase in the component has occurred. Therefore, the usual or \u201cregular\u201d component claims at the time of label review must be presented so that the necessary comparison of formulations can be made. (3) In the situation where production of the \u201cregular\u201d product formulation ceases, the \u201cextra\u201d or \u201cmore (component) than\u201d product labels would be given a 6-months temporary approval. (4) A comparison to a similar product on the market may be made to support the \u201cextra\u201d or \u201cmore\than\u201d type claim, provided suitable market basket data are submitted with the label application that establish the similarity of formulations and show the increased amount of the component over the \u201cusual\u201d amount. See: Policy

Memo 118 dated October 31, 1988", "FABRICATED STEAK: 1. Steaks that include large sections or pieces of meat that are molded or shaped to form one large piece and then sliced. A qualifier such as \u201cformed\u201d must be included in the product name. 2. Raw fabricated steaks with added solutions must be labeled in accordance with 9 CFR 317.2(e)(2). 3. Antioxidants are permitted. 4. When made from simulated fat covering and or marbling, the product name must contain a truthful descriptive designation, for example, \u201cartificially marbled-simulated fat covered beef steak.\u201d FAJITAS: The Spanish translation is \u201clittle belts\u201d or strips of meat. Fajitas are strips of seasoned or marinated red meat or poultry meat, which have been cooked. Red Meat Fajitas require labeling in accordance with the current policy memo for cooked red meat with added solutions (Policy Memo 084A). Fajitas may also be sandwich-like product, requiring 15 percent strips of cooked meat or poultry meat (excluding the solution above green weight), topped with onions, peppers, and sauce, and rolled in a flour tortilla. Fajita, including the name of the meat or poultry, may stand alone, for example, \u201cBeef Fajita,\u201d \u201cChicken Fajita.\u201d Raw meat or poultry strips with added solutions must be labeled in accordance with 9 CFR 317.2(e)(2) or 9 CFR 381.117(h), and identified as \u201c...for fajitas\u201d, for example, \u201cbeef strips containing 10% of a solution of water, salt, spices, and spice extractives for fajitas.\u201d FARM STYLE SAUSAGE: See: Country Style (Farm Style) Sausage FARMER SAUSAGE CERVELAT: Is usually a semi-dry sausage; but may be made in dry form. Usually made of equal parts of pork and beef delicately seasoned without garlic. FARMER SUMMER SAUSAGE: This is a special type of sausage made of beef and pork, salt, spices, nitrite or nitrate, and heavily smoked. It is classed as \u201cCervelat,\u201d and no extenders are permitted. It is dry with an MPR of 1.9:1. The word \u201cFarmer\u201d is considered a generic term, and labels can be approved without any qualifying words like \u201cStyle\u201d or \u201cBrand.\u201d Such labels are not required to bear a statement identifying the place of manufacture. The Product must be trichina-treated. FIBER PRODUCTS: Fiber products such as bran are acceptable only in non specific products.", "Fiber type foods are permitted in meat and poultry products and must be identified by their common or usual name, such as oat bran. However, fiber is not permitted in meat or poultry products, e.g., soy fiber, oat fiber, and wheat fiber. Presently, there is no recognized definition for fiber. FILLET STYLE: \u201cFillet style\u201d must be qualified, e.g., \u201cchunked and formed,\u201d if the meat or poultry product is not made from a solid piece of meat or poultry. The term \u201cfillet\u201d is defined as a solid piece of meat or poultry. FLANKEN IN THE POT: The product must contain at least 25 percent beef. Product is made from beef plates and may contain such components as Matzo Balls, Noodles, and Vegetables. True product name, e.g., \u201cFlanken in the Pot with Matzo Balls, Noodles and Vegetables\u201d must be used. FLAVORED WITH --: Any product with a standard in Section 9 CFR 319 and 9 CFR 381 of the regulations must meet that standard and may not be designated \u201cflavored with.\u201d If a product does not meet the standard as it appears in the Policy Book it can be labeled \u201cFlavored with.\u201d \u201cFlavored with\u201d can be anything from over 3 percent fresh meat or 2 percent cooked meat to below the standard for the product. FLAVORING: Ingredients, e.g., thiamine hydrochloride, monosodium glutamate, disodium inosinate, disodium guanylate, hydrogenated vegetable oil, and other commonly used materials must be listed separately. Such ingredients as diacetyl, hexanal, ethyl alcohol, dimethyl sulfide, diallyl sulfide, and furfuryl mercaptan may be declared as artificial flavors or artificial flavorings

without naming each. When spices and\or flavorings are presented on labels coming from foreign countries, the identity of the spices and\or flavorings must be made known.

**FOIE GRAS PRODUCTS, DUCK LIVER AND\OR GOOSE LIVER:** Goose liver and duck liver foie gras (fat liver) are obtained exclusively from specially fed and fattened geese and ducks. Products in which foie gras is used are classified into the following three groups based on the minimum duck liver or goose liver foie gras content:","

**(A) FRENCH PRODUCT NAME ACCEPTABLE ENGLISH PRODUCT NAME** Foie Gras d'Oie Entier Whole Goose Foie Gras Foie Gras de Canard Entier Whole Duck Foie Gras These are products in which goose liver or duck liver foie gras are the only animal tissues present. They may contain added substances, e.g., seasonings and cures and when truffles are featured in the product name, they are required at a minimum 3 percent level.

**(B) FRENCH PRODUCT NAME ACCEPTABLE ENGLISH PRODUCT NAME** Foie Gras D'Oie Goose Foie Gras Foie Gras de Canard Duck Foie Gras Bloc de Foie Gras D'Oie Block of Goose Foie Gras Bloc de Foie Gras de Canard Block of Duck Foie Gras Parfait de Foie Gras D'Oie Parfait of Goose Foie Gras Parfait de Foie Gras de Canard Parfait of Duck Foie Gras These products are composed of a minimum 85 percent goose liver or duck liver foie gras, although \u201cparfaits\u201d may contain mixtures of goose liver and\or duck liver foie gras. These products may also contain a wrapping or stuffing consisting of the lean or fat of pork, veal, or poultry, pork liver, and\or aspic jelly. When these ingredients are used, their presence must be indicated in a product name qualifier. Truffles, when featured in the product name, are required at a minimum 3 percent level.

**(C) FRENCH PRODUCT NAME ACCEPTABLE ENGLISH PRODUCT NAME** Pate de Foie D'Oie Pate of Goose Liver Pate de Foie de Canard Pate of Duck Liver Galantine de Foie D'Oie Galantine of Goose Liver Galantine de Foie de Canard Galantine of Duck Liver Puree de Foie D'Oie Puree of Goose Liver Puree de Foie de Canard Puree of Duck Liver These products must contain a minimum of 50 percent duck liver and\or goose liver foie gras and may also contain a wrapping or stuffing of the lean or fat of pork, veal, or poultry, pork liver, aspic jelly, extenders, and\or binders. When these ingredients are used, their presence must be indicated in a product name qualifier. Truffles, when featured in the product name, are required at a minimum 1 percent level.","

-- In all groups, an English translation of the term \u201cfoie gras\u201d is not required, although all other product name terms must be translated into English. The kinds of poultry liver(s) used must be indicated in the product name. Also, other species and\or binders used must be indicated in a product name qualifier immediately following the product name, while the ingredients statement must follow the product name or qualifier as the case may be. See: Policy Memo 076 dated September 21, 1984

**FOR FURTHER PROCESSING:** Products that require further processing at another federally inspected plant may leave a federally inspected plant under one of the following conditions: 1. With the name of the finished product qualified by a \u201cFor Further Processing\u201d statement (for example, \u201cTurkey Ham For Further Processing\u201d); or 2. With a fully descriptive name. (for example, uncooked ham contains up to 30% of a solution of water, salt, sodium erythorbate, and sodium nitrite) \u201cFor Further Processing\u201d is not acceptable on a label when a product is formulated or processed in a manner contrary to the regulations.

**FRESH,\u201d \u201cNOT FROZEN\u201d AND SIMILAR TERMS WHEN LABELING MEAT AND POULTRY PRODUCTS:** The word \u201cfresh\u201d may not be used to describe: 1. Any cured product, e.g., corned beef, smoked cured turkey, or prosciutto. 2. Any canned, hermetically sealed shelf stable, dried, or chemically preserved product. 3. Any raw poultry, poultry part, or

any edible portion thereof whose internal temperature has ever been below 26 degrees Fahrenheit. 4. Any injected, basted, marinated poultry, poultry part or any edible portion thereof whose internal temperature has ever been below 26 degrees Fahrenheit. 5. Any other finished processed poultry product (including cooked poultry products) where its temperature has ever been below 26 degrees Fahrenheit, e.g., turkey sausage, chicken meatballs, cooked breaded chicken nuggets, etc. 6. Any uncured red meat product permitted to be treated with a substance that delays discoloration, such as, ascorbic acid, erythorbic acid, or citric acid. 7. Any product treated with an antimicrobial substance or irradiated.", "8. The phrase \u201cnever frozen\u201d or similar verbiage is not permitted on an unprocessed or processed poultry product where the internal temperature of the product has ever been below 0 degrees Fahrenheit or on any red meat product that has ever been frozen. Further, the phrase \u201cnever frozen\u201d or similar verbiage is not permitted on refrigerated secondary products where the meat or poultry component has ever been frozen, e.g., multi-component meals, dinners, etc. Generally, trademarks, company names, fanciful names, etc., containing the word \u201cfresh\u201d are acceptable, even on products produced in a manner described in one through seven above, provided the term is used in such a manner that it remains clear to the purchaser that the product is not fresh. Secondary products, e.g., pizza, multi-component meals, dinners, etc., sold in the refrigerated state, i.e., not frozen or previously frozen, may be labeled as \u201cfresh\u201d when the term is used to describe the product as a whole even when made from components processed in a manner described in one through seven above. This entry cancels Policy Memo 022C dated January 11, 1989, since 022C is out of date.

**FRESH THURINGER:** Not an acceptable name.

**FRIED NOODLES WITH PORK:** The product must contain at least 12 percent fresh pork in total formulation.

**FRIED PRODUCTS:**

1. Frying medium need not be shown on the label.
2. Breading is not limited to 30 percent unless breaded is in the product name.
3. Fried chicken labels do not need to state \u201cfully cooked\u201d or refer to breading because fried denotes fully cooked and breading is expected. Fried poultry products in dinners are limited to 30 percent breading.

**FRIED RICE WITH MEAT:** The product must contain at least 10 percent meat; may contain eggs and vegetables.

**FRIES:**

1. Beef testicles may be labeled as \u201cBeef Fries.\u201d They are not permitted to be used as an ingredient in meat food products.
2. \u201cFries\u201d is not a required part of the product name, \u201cspecies mountain oyster.\u201d

**FRITTERS:** The product must contain at least 35 percent raw red meat\poultry or red meat\poultry food product in the total formulation depending on the name, i.e., \u201cBeef Fritter\u201d must contain 35 percent beef and a \u201cChicken Patty Fritter\u201d must contain 35 percent chicken patty. Fritters can contain up to 65 percent batter\breading (coating). If \u201cbreaded\u201d is included in the product name, the batter\breading is limited to 30 percent. See: Policy Memo 089 dated May 29, 1985

**FRIZZES:** An acceptable name. Similar to pepperoni but not smoked. MPR of 1.6:1.

**GALICIAN SAUSAGE:** Cured beef and pork is seasoned and stuffed into beef rounds. It is then smoked at a high temperature. Cooling is done in a blast of air which produces a wrinkled appearance which is characteristic of Galician sausage.

**GELATIN:** Gelatin is a binder\extender and is only permitted in a few meat and poultry products. Examples where gelatin is permitted include:

1. non-specific products
2. jellied products, e.g., souse, jellied beef loaf and head cheese
3. as a covering for products such as pat\u00e9, to bind two pieces of meat together and in products where \u201cgelatin\u201d would be part of the product name

Gelatin is permitted as a

thickening agent in menudo (i.e., beef tripe stew). If it is used in red meat pat\u00e9 products, its presence must be indicated by product name qualification. It is not permitted in products like sausage, luncheon meat, and meat loves. Gelatin is an acceptable ingredient in souse, jellied beef loaf, headcheese, canned whole hams requires qualifier if gelatin is added. See: MPI Manual 18.19 (b)(2) See: Policy Memo 121B GELATIN IN POULTRY ROLLS: If gelatin or some other binder comprises more than 3 percent of the formula, the name of the product must be qualified by wording, e.g., \u201cGelatin Added.\u201d See: MPI Manual 18.19 (b)(2)"GENERAL OFFICES: The company\u2019s grant of inspection permits the general office address to be used in the signature line for any firm \u201cdoing business as.\u201d GENOA OR GENOA SALAMI: Is a dry sausage product with an MPR not in excess of 2.3:1. It is prepared with all pork or with a mixture of pork and a small amount of beef. The meat is given a coarse grind and enclosed in a natural casing. No smoke is used in its preparation. GEOGRAPHIC AND RELATED TERMS (REQUIREMENTS FOR THE USE ON PRODUCT LABELS): Any label representation that expresses or implies a particular geographical origin of the product, or any ingredient of the product, shall not be used except when such representation is: 1. A truthful representation of geographical origin, e.g., \u201cVirginia Ham\u201d for a ham produced in the State of Virginia; or 2. A trademark or trade name which: a. has been so long and exclusively used by a manufacturer or distributor that it is generally understood by consumers to mean the product of the particular manufacturer or distributor, e.g., \u201cSwiss Chalet;\u201d or b. is so arbitrary or fanciful that it is generally understood by the consumer not to suggest geographical origin, e.g., \u201cMoon Sausage;\u201d or 3. A part of the name required or allowed by an applicable Federal law, regulation or standard, e.g., \u201cFrankfurter,\u201d \u201cVienna;\u201d or 4. A name whose market significance is generally understood by consumers to connote a particular class, kind, type or style of product, or preparation rather than to indicate geographical origin of the product, e.g., \u201cMexican Style Dinner,\u201d \u201cItalian Style Pizza.\u201d Such terms must be qualified with the word \u201cstyle\u201d or \u201ctype,\u201d unless specifically approved by the Administrator as a generic term, e.g., \u201cLebanon Bologna,\u201d \u201cGenoa Salami,\u201d \u201cMilan Salami.\u201d Any geographical representation that does not meet the aforementioned guidelines should be qualified by the word \u201cbrand,\u201d provided that the word \u201cbrand\u201d is not used in such a way as to be false or misleading. A qualifying statement identifying the place where the product was actually made is required in proximity to the brand name, e.g., \u201cMilwaukee Brand Bacon, Made in Chicago, Illinois.\u201d The word \u201cBrand\u201d must be in the same size", "and style of type as the geographical term. If the product has a foreign brand name, it may be identified as having been made in this country, e.g., \u201cScandinavian Brand Bacon, Made in U.S.A.\u201d. See: Policy Memo 068 dated February 9, 1984 GEOGRAPHIC TERMS: 1. Country, Ranch, and Farm in Trade, Branch and Fanciful Names: Trade names, brand names, or fanciful names that include the words country, ranch, or farm, e.g., \u201cCountry Kitchen,\u201d \u201cRanch House,\u201d \u201cHickory Farms,\u201d or \u201cCarabeef Ranch Brand\u201d do not invoke section 9 CFR 317.8 of the regulations regarding the use of the term \u201cCountry\u201d or \u201cFarm\u201d. However, if the terms are used alone in conjunction with the product name, e.g., \u201cCountry Stew,\u201d then such products must be prepared in the country or on the ranch or farm and meet any other requirements prescribed. 2. Southern: The term

\u201cSouthern\u201d is restricted to use only in areas south of the Mason-Dixon Line and east of the Mississippi River as well as Arkansas, Louisiana, and Missouri, which are also considered southern states. GERMAN POTATO SALAD WITH BACON: The product must contain at least 14 percent cooked bacon in total formulation. See: Salad-German Potato Salad

GERMAN SAUSAGES WITH MILK: Whole milk is a permitted ingredient in the following meat food products when the ingredients statement is shown immediately under the name of the product or the milk is shown in a qualifying statement contiguous to the product name: Speckblutwurst, Kalbsbratwurst, Langblutwurst, Blutwurst, Gelbwurst, Zengenwurst, Brand Tongue and Blood Pudding Kalbslebenwurst. (Swiss Liver Sausage, Kalbslebenwurst should be considered on the same basis as Bockwurst (e.g., no limit on water or milk)). Milk is a characterizing ingredient in German sausages and not an extender. Products which contain milk should be called by their proper names.

GIBLET GRAVY (Kind): Requires 7.25 percent giblets. The product must contain an equal number of livers, hearts, and gizzards." "GIBLETS AND\OR NECKS SOLD WITH CARCASSES: Poultry giblets consist of approximately equal numbers of hearts, gizzards, and livers, as determined on a count basis. Rabbit giblets consist of the liver and heart. Although often packaged with them, the neck is not a gibblet. Gibblet packs are expected within the cavities of eviscerated whole birds or eviscerated whole rabbits or when packaged with cut-up whole birds or cut-up whole rabbits, therefore, qualifying the presence of giblets is not required on labeling. However, when giblets are not expected, a product name qualifier is required, e.g., \u201cPacked with Giblets.\u201d In situations where parts of giblets are missing, a product name qualifier is required, e.g., \u201cParts of Giblets Missing\u201d or \u201cParts of Giblets May Be Missing.\u201d In situations where the giblets are missing entirely from an eviscerated carcass or a cut-up whole carcass, a product name qualifier is required, e.g., \u201cPacked Without Giblets.\u201d In addition, an excess of one of the gibblet components can not be added to make up for another missing gibblet component. In this case, a proper qualifying statement is required, e.g., \u201cPacked with 2 Gizzards, 1 Liver.\u201d A neck, when not attached to the carcass of a whole bird, is also expected to be present within the carcass or packed with the cut-up whole carcass. Accordingly, a product name qualifier is not required to flag the presence of the neck. Rather, when the neck is missing, a product name qualifier is required, e.g., \u201cWithout Neck.\u201d See: 9 CFR 381.170 (b) (21) and 9 CFR 354.

(m) GLYCERIN: May not be added to any product as such; may be used in proprietary mixes.

GOETTA: An oatmeal product similar to scrapple. Goetta is prepared with a formula containing not less than 50 percent meat and meat byproducts. The cereal component should consist of oats or oat products and just enough water to prevent product from sticking and burning", "during the preparation process. The term \u201cOld Fashioned\u201d when noted on a label for \u201cGoetta\u201d refers to the round shape.

GOETTINGER CERVELAT: A dry cervelat with no byproducts or binders.

GOOSE LIVER OR GOOSE LIVER SAUSAGE: At least 30 percent cooked goose liver. When pistachio nuts are added, product name must be qualified, i.e., \u201cpistachio nuts added.\u201d

GORDITAS, MEAT\POULTRY: The product must contain at least 15 percent cooked meat\poultry based on the weight of the total product. The \u201cspecies\u201d or \u201ckind\u201d gorditas name (Beef Gordita, Chicken Gordita) may stand alone. If other characterizing ingredients such as potatoes, rice, beans, etc, are included in the name, they must be reflected in their order of predominance, e.g., Beef and Potato Gorditas, Rice and Chicken Gorditas, as determined by the formula.

GOTEBORG: A Swedish dry

sausage made of coarsely chopped beef and sometimes pork. Mildly seasoned with thyme. It has a somewhat salty flavor and is heavily smoked, usually in long casings and air dried.

GOTHAER CERVELAT: Originated in Gotha, Germany. Usually made of very lean pork finely chopped and cured. GOULASH: A stew-like product with at least 25 percent meat or 12 percent poultry meat. Unless designated "Hungarian," generally means stew, whether veal, pork, beef, turkey, etc., are used. Product may be just meat and gravy or meat and gravy with vegetables served with or without rice, potatoes, or noodles. GOULASH, HUNGARIAN STYLE: The product must contain paprika and at least 25 percent meat or 12 percent poultry meat. May not contain noodles, potatoes or dumplings.", "GRADE MARKS: Labeling of grades on species that are not officially graded, that reference US, USDA, or enclosed within an official shield, are not permitted (e.g., "USDA Choice pork," or "US Prime pork") statements are not allowed because pork product is not graded). However, official grade names may be used for non-graded species products, provided they do not reference US, USDA, or are enclosed in or near an official grade shield. For example, Prime Ham or Choice Pork Shoulder. Grade marks for products imported from foreign countries can only use that country's grading system. Foreign countries cannot use USDA, AMS grading terminology, i.e., prime, choice, select on foreign product entering or processed in the U.S. The grading term "good" on poultry is considered puffery and is acceptable. Meat (beef, veal, and lamb) grading terms, "prime," "choice," "select," may not be used immediately preceding "kind" poultry, unless the poultry is equivalent to USDA Grade A. For example, "Choice Turkey" or "Select Chicken" must come from Grade A birds. Graded product labeled as "Select or Higher" "Choice or Higher" are only allowed on wholesale labeled product, not on retail. Product intended for retail can only be labeled with one specific grade e.g., "Choice" product in a Choice retail package." GRAVIES: The product must contain at least 25 percent meat stock or broth, or 6 percent meat. Mono and diglycerides allowed in amount of 1 percent in gravies. GRAVY AND BEEF: The product must contain at least 35 percent cooked beef (beef same size lettering as gravy). For 25 percent cooked beef (beef lettering no larger than one-half size gravy). GRAVY AND DRESSING WITH PORK OR GRAVY AND PORK WITH DRESSING: The product must contain at least 14 percent cooked pork. GRAVY AND POULTRY SALISBURY STEAK: Not more than 65 percent gravy and at least 35 percent poultry salisbury steak. GRAVY AND SWISS STEAK: The product must contain at least 35 percent cooked meat. GRAVY AND YANKEE POT ROAST: The product must contain at least 35 percent cooked beef. Beef is cooked with or without vegetables.", "GREEK SAUSAGE: The product must contain orange peel. GROUND BEEF: May not contain added fat. Maximum total fat 30 percent. Cheek meat is permitted up to 25 percent and must be declared in the ingredients statement. For more than 25 percent, show as "Ground Beef and Cheek Meat," all the same size. Beef of skeletal origin, or from the diaphragm or esophagus (weasand) may be used in the preparation of chopped beef, ground beef, or hamburger. Heart meat and tongue meat as organ meats are not acceptable ingredients in chopped beef, ground beef, or hamburger. See: Policy Memo 027 dated June 15, 1981 GROUND BEEF CHUCK AND ROUND: Product to be labeled "Ground Beef Chuck" or "Ground Beef Round" must comply with the following guidelines:

1. "Ground Beef Chuck" must be derived from all or part of the primal part of the beef carcass commonly referred to as the "Beef Chuck" except as provided for in 3.

The product must comply with the fat requirements of 9 CFR 319.15(a). 2. \u201cGround Beef Round\u201d must be derived from all or part of the primal part of the beef carcass commonly referred to as the \u201cBeef Round,\u201d except as provided for in 3. The product must comply with the fat requirements of 9 CFR 319.15(a). 3. Generally, shank meat may be added but may not exceed the natural proportion of the beef carcass, which is considered to average 6 percent. Higher quantities of shank meat may be used if the shank meat remains attached during the cutting and boning of the boneless chuck or round, or if the processor can demonstrate that a higher percentage is applicable. See: Policy Memo 091 dated September 16, 1985 GROUND BEEF -Hamburger and Soy Products: Combinations of ground beef or hamburger and soy products may be descriptively labeled, e.g., \u201cHamburger and Textured Vegetable Protein Product\u201d or \u201cGround Beef and Isolated Soy Protein Product\u201d if the combination product is not nutritionally inferior to hamburger or ground beef. If the combination products are nutritionally inferior, they are to be labeled as Imitation Ground Beef (or Imitation Hamburger) or Beef Patty or Beef Patty Mix in accordance with Section 9 CFR 317.2(j)(1) and Section 9 CFR 319.15(c) respectively. See: Policy Memo 016B dated August 18, 1994", "GUM ARABIC: May be used up to 2 percent in breading and batter mixes. GUM TRAGACANTH: A carrier and stabilizer in liquid spice extractives not to exceed 0.1 percent in finished product. Not permitted in sausage products. GUM-Vegetable: Spice extractive products which employ vegetable gums as emulsifiers have been approved. The addition of vegetable gum is limited to no more than 15 percent in the seasoning blend emulsion. GUMBO: A Creole word for okra. It is now recognized as meaning a dish or a soup thickened with okra. To qualify, the dish must have okra as an ingredient. Either the soup or the stew standard would apply, depending on product name (\u201cChicken Gumbo\u201d). Product identified as \u201cCreole Style Gumbo\u201d does not contain okra, however, it must contain a roux (flour, milk, or water, etc.) or gumbo file (dried powder young leaves and leaf buds of sassafras). GYROS: Products identified with this term must contain at least 65 percent meat and no more than 12 percent extenders and binders. Examples include gyro loaf, gyro cone, gyro portions, and gyro slices. HALAL AND ZABIAH HALAL: Use of the terms, \u201cHalal and Zabiah Halal\u201d on labeling requires certification by an appropriate third party authority. HAM A LA KING: Must contain at least 20 percent ham (cooked basis). HAM AND BACON LOAF: There is a limit of 3 percent water in this product.", "HAM AND CHEESE LOAF: Nonspecific loaf. Cheese is chopped into small cubes and combined with finely ground ham. HAM AND CHEESE SALAD: Product must contain at least 25 percent ham (cooked basis). See: Salads HAM AND CHEESE SPREAD: Product must contain at least 25 percent ham (cooked basis). HAM AND DUMPLINGS AND SAUCE OR GRAVY: Product must contain at least 18 percent cooked ham. HAM, BOILED: A fully cooked, boneless product which must be cooked in water and may be processed in a casing or can. The product may be of various shapes and may be partially cooked in boiling water. HAMCOLA: Not an acceptable product name; should be accompanied by true product name, i.e., \u201cBoneless Cooked Ham Coated with Spices.\u201d HAM CAPACOLLA, COOKED: Ham that has been cured and then cooked. HAM CHOWDER -CONDENSED: Product must contain at least 10 percent cooked ham. HAM-COOKED-SECTIONED AND FORMED: The qualifying phrase \u201csectioned and formed\u201d is no longer required on boneless ham products, e.g., \u201cham\u201d and \u201cham-water added.\u201d The addition of small amounts of ground ham added as a binder to such products may be used without declaration.

The amount of ground ham that may be used can represent no more than 15 percent of the weight of the ham ingredients at the time of formulation. Products containing more than 15 percent ground ham trimmings must be labeled to indicate the presence of the ground ham, e.g., "\u201ca portion of ground ham added.\u201d Policies regarding the required use of terminology such as \u201ccunked and formed\u201d and \u201cground and formed\u201d will continue. See: Policy Memo 023 dated February 10, 1981 Policy Memo 041B dated February 15, 1991 Whole hams require a cooking temperature to differentiate the ready to eat products from trichinae treated products. The reason that the temperature is required is to determine the label requirements (e.g., safe handling) and proper serving size. HAM

CROQUETTES: Product must contain at least 35 percent cooked ham. If chopped ham is used, the product name must be \u201cChopped Ham Croquettes.\u201d HAM, FRESH (or uncured): Ham that does not contain a cure must be labeled either \u201cFresh\u201d or, if the ham meets the requirements of 9 CFR 319.2, \u201cUncured.\u201d This also applies to cooked product, and must be labeled cooked product \u201cCooked Uncured Ham.\u201d HAM HALF: \u201cHalf Ham\u201d is permitted on labels for semi-boneless ham products which during their processing have had the shank muscles removed. The two halves of the finished product have approximately an equal amount of bone. The term \u201cNo Slices Removed\u201d has also been deemed suitable for use with a ham item referred to as \u201cHalf Ham.\u201d HAM OMELET: Product must contain at least 18 percent cooked ham. HAM\PARMA

HAM\PROSCIUTTO DI PARMA: Ham, when labeled \u201cParma Ham\u201d and\or \u201cProsciutto di Parma,\u201d would have to be produced in the region of Parma, Italy, in accordance with Italian Law, which defines the denomination of origin, the territorial limits of production, characteristics of the product, and the method of manufacture. HAM, QUARTER, SEMI-BONELESS (No Slices Removed): The product consists of a ham prepared as a

\u201cRegular Semi-Boneless, Half Ham\u201d which is sectioned again to result in four pieces just about equal not only in weight but also in content of bone.", "HAM ROLL SAUSAGE: Ham trimmings and ham shank meat are permitted. HAM SALAD: Product must contain at least 35 percent cooked ham. Chopped ham may be used without it appearing in the product name.

See: Salads HAM, SCOTCH STYLE: A cured, uncooked, boned, and rolled whole ham either tied or in a casing. HAM, SHANKLESS: When the term, \u201cshankless\u201d is used in reference to a ham, it indicates that the shank has been removed by a cut through the joint at a right angle to the femur bone. The distal tip of the semitendinous muscle may be severed above its tendinous attachment, leaving an extension approximately 2 inches long. The extension is considered an integral part of the ham's body and is usually folded over the femur's end. HAM SHORTCAKE: Product must contain at least 25 percent cooked ham. HAM TRIMMINGS: Ham trimmings, to be labeled as ham, cannot contain excess shank meat. The fat content will not exceed 35 percent. It will consist of at least 65 percent lean meat as determined by chemical analysis. HAM, WESTPHALIAN OR WESTPHALIAN STYLE HAM: Ham is cut with bone in, the hip bone cut out, cured in a combination of dry and pickle cure but not a pickle alone. It is smoked in a medium warm (no greater than 100o F.) smokehouse until a shining red brown or chestnut color is acquired. Beechwood may be used and will impart the characteristic Westphalian flavor. Other hard woods are also acceptable. Juniper berries are permitted.", "HANDLING STATEMENTS: Acceptable handling statements, in addition to those required in sections 9 CFR 317.2(k) and 9 CFR 381.125, include \u201cKeep Refrigerated -May be Frozen\u201d or

\u201cKeep Refrigerated-Can be Frozen.\u201d See: Policy Memo 014 dated September 12, 1980. HANDLING STATEMENTS ON RETORTED PRODUCTS: Handling statements may appear on labels for shelf stable product, even though such product does not have to be refrigerated or frozen, and provided the statement will accurately reflect conditions of distribution and sale. These products are to be handled in the plant as shelf stable items including incubation and condition-of-container examinations. Once the product is refrigerated or frozen for shipment, distribution, and display for sale it is to be handled as a refrigerated or frozen item. See: Policy Memo 104 dated February 13, 1987 The statement \u201cpreviously handled frozen for your protection, refreeze or keep refrigerated\u201d is now acceptable on poultry products under the usual restriction of use for such statements. HEAD MEAT: After removal of the cheeks, lips, snout, skin, and tongue from the head there remains small pockets and areas on the skull to which muscle tissue is attached. This muscle may be removed and used in product and declared on labeling as beef or pork as the case may be. However, there are a few standardized products in which the regulations limit the amount of this meat that may be used and require that it be specifically declared on the label (e.g., chili, chili with beans, and corned beef hash). See: Beef Cheek Meat and Beef Head Meat (use and labeling as an ingredient in meat Food Products) HEADCHEESE: A jellied product consisting predominantly of pork byproducts and seasoning ingredients. It must contain some product from the head. Extenders like cereal, soy derivatives, nonfat dry milk, etc., are not permitted ingredients of headcheese.", "HEARTS: Beef and Pork Hearts that include the heart cap are considered meat by-products defined in 9 CFR 301.2. They may not be labeled as \u201cbef,\u201d \u201cpork,\u201d etc. in an ingredients statement. When used in a product, they must be identified by species, for example, \u201cBeef Hearts.\u201d Hearts that include the heart cap may be considered meat only for the purpose of calculating the meat to textured vegetable protein ratios. HEAT AND EAT SAUSAGE: Not the same as Brown and Serve Sausage. When the \u201cheat and eat\u201d term is used, product must comply with cooked sausage regulations, e.g., limitation of 10 percent added water and not more than 3 1\2 percent binder. HICKORY SMOKED: \u201chickory flavored\u201d ad \u201chickory taste\u201d are acceptable terms on products that have been smoked with some hickory in the sawdust. They do not need to be smoked with 100 percent hickory smoke. HIGH FRUCTOSE CORN SYRUP (HFCS): HFCS may be used to flavor meat or poultry products in amounts sufficient for its intended purpose, provided the following conditions are met: 1. HFCS must contain not less than 40 percent fructose on a solids basis. 2. HFCS must have a dextrose equivalence (D.E.) of not less than 93. 3. HFCS must have a sweetening power greater than or equal to sugar (sucrose). 4. HFCS must be identified on the label as High Fructose Corn Syrup in the ingredients statement, curing statement, etc. See: Policy Memo 035 dated October 27, 1981 HOLSTEIN OR HOLSTEINER: Product is the same as FARM STYLE SAUSAGE, except that it is stuffed into wide casings and heavily smoked, usually in long casings, and air dried. No extenders are permitted.", "HONEY CLAIM IN PRODUCT: A honey claim may be made or implied on a product label if: 1. The product contains at least 3 percent honey. 2. Honey contains at least 80 percent solids, U.S. grade C or above. 3. When other sweeteners, (sugar, dextrose, maltose, invert sugar, corn syrup solids, and similar ingredients) are used, the quantity may not exceed one-half that of the honey, e.g.. If 3 percent honey is used, then no more than 1 1\2 percent of all other sweeteners may be used. 4. Product to be identified as \u201choney Glaze\u201d must contain honey to other sweeteners at a ratio no less than 2:1. If dried honey

is used, the ratio is to be no less than 1.6:1. 5. When honey is included in a breading, a honey claim may be made regardless of the quantity of honey used. HONEY CURED OR SUGAR CURED: \u201cHoney Cured\u201d may be shown on the labeling of a cured product if: (1) the honey used contains at least 80 percent solids or is U.S. grade C or above; (2) honey is the only sweetening ingredient or when other sweetening ingredients are used in combination with honey, they do not exceed one-half the amount of honey used; and honey barbecue touch of honey (3) honey is used in an amount sufficient to flavor and\or affect the appearance of the finished product. Traditionally, cured products which are labeled to indicate the presence of honey, e.g. Honey ham, must meet the parameters prescribed herein. \u201cSugar Cured\u201d may be used on the labeling of a cured product if: (1) the sugar used is cane sugar or beet sugar; (2) sugar is the only sweetening ingredient or when other sweetening ingredients are used in combination with sugar, they do not exceed one-half the amount of sugar used; and (3) sugar is used in an amount sufficient to flavor and\or affect the appearance of the finished product.", "\u201cHoney and Sugar Cured\u201d or \u201cSugar and Honey Cured\u201d may also be used on labeling if: (1) the honey and sugar are of the nature described above; (2) the honey and sugar are the only sweetening agents or when other sweetening ingredients are used in combination with the honey and sugar, they do not individually exceed either the amount of honey or sugar used and collectively do not exceed one-half the total amount of honey and sugar; and (3) the honey and sugar are used in amounts sufficient to flavor and\or affect the appearance of the finished product. See: Policy Memo 038 dated December 16, 1981

HORS D'OEUVRE (Snack): Product must contain at least 15 percent cooked meat or 10 percent bacon (cooked basis). True product name must be shown, e.g., \u201cPuffed Pastry Wrapped Frank.\u201d HOT DOG CHILI SAUCE WITH MEAT: Product must contain at least 6 percent meat. HOT DOG CHILI WITH MEAT: Product must contain at least 40 percent meat. Sausages and bologna rework not permitted. HUNAN STYLE SEASONED PORK: Acceptable for pork shoulder sliced into one inch pieces and marinated in a solution of soy sauce, garlic, and ginger, cooked and returns to green weight. The product may be flavored with other seasoning ingredients, e.g., star anise and coriander.

HYDROLYZED BEEF STOCK: A beef stock which has been treated with acid, alkali, or enzymes to digest the protein. The protein molecules are broken down into amino acids, peptides, polypeptides, and peptones. As the digestion is carried out for longer periods of time, more and more of the larger molecules are broken down into amino acids, with free alpha-amino groups. By analyzing these alpha-amino nitrogens one can determine the degree of hydrolysis. 100 percent hydrolysis would mean that all the nitrogen (protein) is in the form of amino acids. 10 percent of hydrolysis would mean that only 10 percent of the nitrogen is in the form of free amino acids, while the rest is still present in polymeric form.", "The label should indicate the degree of hydrolysis. This is determined from the ratio of amino nitrogen to total nitrogen. amino nitrogen = percent hydrolysis total nitrogen

A product labeled 50 percent Hydrolyzed Beef Stock must, therefore, have 50 percent of the total nitrogen present as amino nitrogen. Adding percent solids is optional. The percent solids would not necessarily be the same percent as hydrolysis depending on the thickness (consistency) of product.

HYDROLYZED GELATIN: Hydrolyzed gelatin is permitted in frankfurters and similar products (9 CFR 319.180) at levels typically used for flavorings (less than 2 percent). Hydrolyzed gelatin may currently be used a 2 percent in 9 CFR 319.180 and like products as a flavoring. If gelatin is used in a product, make sure it is permitted for use in the product.

Hydrolyzed gelatin is acceptable in poultry franks 9 CFR 319.180 and like products at levels not to exceed 2 percent of total formula until otherwise notified. Hydrolyzed gelatin is recognized as a binder rather than flavoring and may be used at levels of 2 percent or less in 9 CFR 319.180 type products. HYDROLYZED OAT FLOUR: Hydrolyzed oat flour is safe and may be used in non-standardized meat\poultry products as a binder at below typical binder use levels, i.e., 3 percent. It may be used in low fat hamburger, water, and hydrolyzed oat flour product as per Policy Memo 121. HYDROLYZED PROTEIN: \u201cHydrolyzed Protein (milk, egg, soy)\u201d is an acceptable common or usual name provided all components are hydrolyzed.

\u201cHydrolyzed Protein (potato, gelatin)\u201d is an unacceptable ingredient declaration and must be declared as \u201chydrolyzed potato protein and hydrolyzed gelatin.\u201d Salt is present in hydrolyzed protein and must appear in the sublisting of the hydrolyzed protein if it does not appear elsewhere in the ingredients statement. HYDROXYPROPYL METHYLCELLULOSE (HPMC): Emulsifying agent, binder, thickener, and a stabilizer. This is accepted for its emulsifying qualities when prepared as a solution and applied as a dip. 1. Not more than 2 percent in solution.", "2. Not more than 4 percent weight gained in product. 3. Not more than .08 percent hydroxypropyl methylcellulose in finished product. 4. Must be identified in the ingredients statement for purpose. 5. Approved on individual basis only. ICE GLAZES WITH

FLAVOR: If an ice glaze component contributes to the flavor profile of the product, the ice glaze coating must be counted toward the total net weight of the finished product. In addition, the product name must contain a descriptive designation for the coating and coating percentage in accordance with 9 CFR 317.2(e)(2) or 381.117(h), for example, \u201craw chicken breast filets with rib meat containing up to 16% of a solution of water seasonings and salt and coated with 6.5% butter garlic seasoning.\u201d Or, if the same solution is used for injection (or by any other method of incorporation) and for the ice glaze coating the percentages may be combined, for example, \u201cchicken breast filets with rib meat, containing and glazed with up to 22.5% of a solution of water, salt, seasonings, and garlic.\u201d ICE-GLAZED BREADED CHICKEN

NUGGETS: If an ice glaze is applied for the purpose of setting the breading, the term \u201cice glazed\u201d needs to appear in close contiguous to the product name. The water cannot be included as part of the net weight statement and the transmittal form should indicated this.

IMITATION FLAVORS: Imitation beef flavor, imitation mushroom flavor, flavor base for gravies and similar substances which enhance, fortify, or help to simulate a flavor are usually composed of food additives and, as such, are not \u201cartificial flavors\u201d for labeling purposes. This class of imitation flavors can be composed of such ingredients as flour, fats, oils, salt, hydrolyzed vegetable protein, vegetable gums, thiamine hydrochloride, beta alanine, disodium inosinate, glutamic acid, and a host of other ingredients. These flavorings must be identified on labels by showing each individual ingredient by its common name. Class names, e.g., amino acids are not acceptable. Each specific amino acid must be listed. INCIDENTAL ADDITIVES: As defined in the Food and Drug Administration regulations (21 CFR 101.100(a)(3)), incidental additives are substances present in foods at insignificant levels and that do not serve a technical or functional effect in that food. In determining whether a substance is an incidental additive, the following criteria may be applied: 1. Substances that are present in a food as a result of having been present in an ingredient added to the food and have a technical or functional effect on the", "ingredient but not on the finished food, or 2. Substances that are processing aids, defined as: a. substances added during processing but removed before the

food is packaged in its finished form, or b. substances added during processing but that are converted to constituents normally present in the food, and do not significantly increase the amount of those constituents naturally found in the food, or", "c. substances that are added to a food for their technical or functional effect in the processing but are present in the finished food at insignificant levels and do not have any technical or functional effect in that food.

**INGREDIENT LABELING:** 1. All ingredients in FDA standardized products, e.g., Cheddar Cheese (Water, salt, cheddar, etc.), and on standardized products, e.g., Soy sauce, Worcestershire sauce, require complete disclosure of all ingredients on the labels of meat and poultry products. 2. Protein hydrolysates must identify the common and usual names and identify the source from which the protein is derived, e.g., \u201chydrolyzed vegetable protein\u201d would be declared as \u201chydrolyzed corn protein.\u201d 3. FDA certified color additives require the listing of the common or usual names, e.g., FD&C Blue No. 1, Blue 1, or Blue 1 Lake. Color additives not subject to certification may be declared as \u201cartificial color,\u201d \u201cartificial color added,\u201d or \u201ccolor added.\u201d Alternatively, color additives not subject to certification may be declared as \u201ccolored with ,\u201d or \u201c color,\u201d with blank space filled in with the name of the color additive listed in 21 CFR 73, e.g., \u201ccolored with annatto\u201d or \u201ccaramel color.\u201d 4. Cured meat products used as ingredients, regardless of their level of use, require complete disclosure of all ingredients in the formulation of meat and poultry products. See: FSIS Directive 7237.1, Rev. 1, \u201cLabeling of Ingredients\u201d FSIS Directive 7140.1, Rev. 1, \u201cQuestions and Answers Relating to Ingredients\u201d

**INSERT LABELS FOR USE AT RETAIL STORES:** No inspection legend is permitted on insert labels. **INSPECTION LEGENDS (DUAL):** Products consisting of mixed meat and poultry ingredients shall bear either the official meat inspection legend or poultry legend, depending on which ingredients are present in the greater amounts. If meat or poultry ingredients exist in equal proportions, either official legend may be used. If meat and poultry ingredients exist in exact proportions and both appear in the product name, the official legend must reflect the ingredient appearing first in the product name. Containers of products intended for sale to household consumers can bear only the official mark of inspection of the product enclosed. Containers of products intended for distribution to other than the retail trade may bear both the official meat inspection legend and the official poultry products inspection legend.", "See: Policy Memo 075 dated August 14, 1984

**INSPECTION MARK ON WING TAG:** When the inspection mark is shown on a wing tag, either the plant number or the firm's name and address must also appear.

**INTESTINES:** Intestines can be prepared as edible product and bear the mark of inspection.

**IRISH STEW:** Product does not require a geographical qualifying statement nor the words, \u201cStyle,\u201d \u201cType,\u201d or \u201cBrand.\u201d Usually it contains lamb or mutton but beef may be used. It must meet the stew standard. Vegetables include onions, carrots, potatoes, and turnips. Dumplings are often used. Beans are not acceptable in \u201cIrish Stew.\u201d

**ISOLATED SOY PROTEIN:** This food ingredient is similar to soy protein concentrate except that additional extraction has removed more of the non-protein fraction, thereby increasing its protein content. It is prepared by alkaline solubilization of the soy protein and then precipitation of same in an acid bath. It may be powdered, extruded, or spun into fibrils and has a protein content of 90 to 95 percent. Products of spun fibrils may be referred to as \u201cTextured Soy Protein Isolate,\u201d \u201cIsolated Soy Protein Fibers,\u201d or \u201cSpun Isolated Soy Protein.\u201d

The PER

of isolated soy protein is about 1.9 and indicates a poorer quality protein than that of soy flour or soy protein concentrate (PER 2.2). When hydrated textured (structured) protein isolate is added to meat food products, the ingredients statement should read \u201cHydrated Textured (Structured) Isolated Soy Protein.\u201d ITALIAN SAUSAGE: Beef and pork Italian sausage is acceptable. Tomato products and other unexpected ingredients can be added if the product name indicates their presence. Red pepper permitted under 9 CFR 319.145(b)(1). See: 9 CFR 319.145 ITALIAN STYLE: Acceptable term for products containing anise or fennel or Italian type cheese (e.g., Mozzarella, Parmesan, Provolone, Ricotta, Romano) or at least three of the following: basil, garlic, marjoram, olive oil, or oregano. Sausage products must meet the Italian Sausage requirements as per Regulation 9 CFR 319.145. "ITALIAN STYLE SMOKED SAUSAGE: This is a smoked sausage (10 percent added water) and is not a 9 CFR 319.145 (Italian sausage) product. However, the product must contain Italian style ingredients found in the policy book under Italian style. JAGWURST: The product is the same as yachtwurst (The Americanized name for the item). It is a cooked sausage made from a fine emulsion with cubes of lean meat rather than fat (as in mortadella). JAMAICAN STYLE: Term may be used to identify meat and poultry food products made with allspice, garlic, onion, red pepper, and thyme. The name of the product must be further qualified with a statement, like \u201cwith Jamaican Style Seasoning,\u201d e.g., \u201cJamaican Style Chicken Wings-with Jamaican Style Seasonings.\u201d If the product formula contains textured soy product, then the ration rules apply. JAMAICAN STYLE PATTIES: Product has at least 25 percent meat enclosed in a crust. The label must show true product name, e.g., \u201cBeef Turnover.\u201d If the formula contains textured soy product, then the ratio rules apply. JAMON: Spanish word for \u201cham.\u201d In the usage of Spanish-speaking people outside Spain, it has come to mean cured pork. \u201cJamon di Cocinar\u201d is cured pork for cooking as opposed to slicing. When the term \u201cJamon\u201d appears before the name of a limb, it means the product is cured. With the exception of products available for sale in Puerto Rico, all Spanish product names followed with the English translation. Examples of acceptable product names are: Jamon de Paleta - Cured Pork Shoulder Jamon de Pierna -Cured Pork Leg JARDINIERE (FR): Must contain at least 50 percent cooked meat based on total product. It means \u201cin the manner of the gardener.\u201d The term applies to dishes made with diced garden vegetables which have been cooked with meat. Jardiniere should be followed by a true product name, e.g., \u201cBeef with Vegetables.\u201d "JERK OR JERK STYLE: The terms \u201cJERK\u201d or \u201cJERK STYLE\u201d can be used to describe red meat or poultry whole muscle, fabricated products, and other meat poultry food products that are mixed or placed in a \u201cspicy seasoning.\u201d The seasoning usually contains scallion, onion, thyme, allspice (pimento), hot peppers, and usually contains at least one or more of the following: nutmeg, cinnamon, sugar, brown sugar, garlic, and rice or wine vinegar. The seasoning may be in the form of paste, marinade, sauce, or dry seasoning mixture. The product is mixed or placed in the spicy hot seasoning raw or the product may be grilled, cooked, or smoked. Examples of acceptable product names are, for example, \u201cOven Roasted Jerk Chicken\u201d, \u201cJerk Pork Sausage\u201d or \u201cJerk Style Smoked Beef Sausage.\u201d Raw \u201cjerk\u201d or \u201cjerk style\u201d meat or poultry products with added solutions must be labeled in accordance with 9 CFR 317.2(e)(2) or 9 CFR 381.117(h), for example, \u201cJerk Style Beef containing 10% marinade of water and spicy seasoning.\u201d JERKY: All Jerky products must

have a MPR of 0.75:1 or less; \u201cspecies\u201d or \u201ckind\u201d must be in the name. Products may be cured or uncured, dried, and may be smoked or unsmoked, air or oven dried. A reference to the particular type of drying method is not a labeling requirement.

1. \u201cBeef Jerky\u201d -Produced from a single piece of beef. May also be classified as \u201cNatural Style Beef Jerky\u201d provided this product name is accompanied by the explanatory statement \u201cmade from solid pieces of beef\u201d or comparable terminology. When a \u201cNatural\u201d claim (not natural style) is made, the policies as outlined in Policy Memo 055 are to be applied.

2. \u201cBeef Jerky Chunked and Formed\u201d -Produced from chunks which are molded and formed and cut into strips.

3. \u201cBeef Jerky Ground and Formed or Chopped and Formed\u201d -Produced as described, molded and formed and cut into strips.

4. Jerky products that contain over 3\u00bd percent binders (2 percent ISP) must reflect the binder in the product name, i.e., \u201cBeef Soy Protein Concentrate jerky, ground and formed. Jerky products that contain binders at levels below 3\u00bd percent should express the binder in a qualifying statement, e.g., beef jerky -soy protein added." ,

"5. \u201cSpecies (or Kind) Jerky Sausage.\u201d The word \u201cJerky\u201d can appear on labels for product in which the \u201cspecies\u201d or \u201ckind\u201d has been processed by chopping or grinding and stuffed into casings under the following conditions only:

a. The word \u201cSausage\u201d must appear immediately contiguous to \u201cJerky\u201d whenever it is shown. \u201cSausage\u201d must be in type at least one-third as high as \u201cJerky\u201d in the same color ink and on the same background. The words \u201cstick,\u201d \u201cpiece\u201d etc. cannot be used as substitutes for \u201csausage\u201d in the product name. \u201cSausage\u201d means that the product has been chopped.

b. The product may be dried at any stage of the process.

JUNIOR MEAT SNACKS: Product must conform to the sausage standards going into the jar before processing. Limited to 3 1/2 percent extenders.

JUNIPER BERRIES: Juniper berries and twigs are normally thrown on the fire from which dry cured hams are smoked. Juniper berries have been approved in the curing ingredients of Westphalian Ham.

KABOBS: Product consists of chunks of red meat or poultry and vegetables placed on a metal or wooden skewer.

\u201cKabob\u201d may be included in the descriptive name, e.g., \u201cBeef, Mushrooms, and Onion Kabob.\u201d A kabob may be cooked or uncooked, but the label must clearly indicate this. This product may contain but does not require vegetables.

KALBELWURST: Product is similar to Bockwurst with no limit on water or milk.

KATRIFITAS: A coined word used to describe a type of empanadillas. The product consists of dough containing yucca made to resemble a meat turnover and has a special meat filling. The product must contain at least 25 percent raw meat (beef) in total formulation. Label must include a true product name in conjunction with \u201cKatrifitas,\u201d e.g., \u201cKatrifitas, Beef Turnover made with Yucca Shell,\u201d or similar wording.

KELCO-GEL: A thickening agent used in sauces. It contains sodium alginate, calcium carbonate, and disodium phosphate. The amount of disodium phosphate in the finished product is approximately 0.099 percent. Its use should be judged on an individual basis.",

"KIDNEYS FROM ENZYME INJECTED BEEF: Product may be exported to other countries. They must be labeled \u201cBeef Kidneys, Tendered with Papain -For Export Only.\u201d

KIELBASA: A sausage that is cured, cooked, and usually smoked. Kolbassy is Czechoslovakian spelling; other variations include Kielbassy, Kolbasa and Kolbase. Kielbasa is made from coarsely ground pork or coarsely ground pork with added beef or mutton. \u201cHungarian Style

Kolbase\ufe0f is finely ground product, seasoned and stuffed into casings. The 70\30 rule can be used, however, pork must always be the predominant meat ingredient. \ufe0fcBeef Kielbasa\ufe0f is prepared with only beef as the meat ingredient. Byproducts are not permitted ingredients in these sausages. An uncured (fresh), uncooked variety, with no more than 3 percent water exists. \ufe0fcFresh\ufe0f shall be used in the name when the product is uncured. When fresh Kielbasa is cooked or smoked, then cooked or smoked is required in the product name. The requirements of Policy Memo 110 apply when these perishable, cooked, uncured products are packaged in hermetically sealed containers. KIPPERED BEEF: A cured dry product similar to beef jerky but not as dry. MPR of 2.03:1 is applied to product. KISKA; Kisba, Kishka, or Stuffed Derma. Ingredients statement is part of the product name. A meat food product prepared two ways: 1. Prepared with meat byproducts, including beef blood, pork snouts, pork livers, pork cheeks, etc. Packaged in fully labeled retail size packages or individually banded. When beef blood is used, it must be shown as part of product name. 2. Prepared with more than 30 percent animal fat, mixed with farinaceous (consisting of or made of flour or meal) materials containing no other meat byproducts and ordinarily stuffed into beef casings and cooked. Product containing 30 percent or less fat is not considered amenable to the Federal Meat Inspection Act.","KNISHES: Product must contain at least 15 percent cooked meat or poultry or 10 percent bacon (cooked basis). Same as snack standard. The type of meat or poultry should be identified in a true product name, e.g., \ufe0fcChicken Knishes.\ufe0f KONJAC FLOUR: Food ingredient that provides the effects of thickening, gelling, texturizing, and waterbinding, e.g.,\ufe0dbinder,\ufe0f similar to that of starch vegetable flours, such as potato flour. Konjac flour can be used in meat and poultry products in which starch vegetable flours are permitted, e.g., 3.5 percent in cooked sausage products such as frankfurters and bologna. KOSHER: Use of the term, \ufe0fcKosher\ufe0f on labeling requires certifications by an appropriate third party authority. KOSHER (Product Containers): Containers must be labeled \ufe0fcKosher tags attached\ufe0f when used for hearts, livers, and other products or tissues with attached metal tags indicating kosher inspection. KRAKOW: Acceptable name for a cooked sausage similar to \ufe0fcBerliner.\ufe0f KREPLACH: Product must contain at least 20 percent meat. The type of kreplach should be identified in a true product name, e.g., \ufe0fcBeef Kreplach.\ufe0f KUBBEE: Other acceptable names are: Kubbe, Kibbe, Kabeda, Kilin, Kibbes, Kibby, Kabbo, or Kabe.\ufe0f A product popular in Syria and Lebanon. It must contain at least 25 percent meat based on total formulation; it must contain soaked cracked wheat and show the true product name, e.g., \ufe0fcFried Cracked Wheat and Beef Balls,\ufe0f \ufe0fcBaked Stuffed Wheat and Beef Patty.\ufe0f Products may be shaped like a hamburger and fried or shaped into balls and fried.","KUEMMELWURST: An acceptable name. The product is the same as Carawaywurst and is a cooked sausage of the ring variety, with whole caraway seeds. Usual ingredients are beef, pork, salt, caraway, flavorings, and cure. KURMA: Product must contain at least 50 percent meat or at least 35 percent poultry meat. LABELING, CHECK-OFF BLOCKS: The use of check-off blocks on immediate containers for identifying products that look alike but are different in composition is not permitted. Examples of product that may look alike but are different in composition are as follows: \uf0a7 Ground Beef and Beef Patty Mix \uf0a7 Partially Defatted Chopped Beef and Partially Defatted Beef Fatty Tissue \uf0a7 Frankfurters and Frankfurters with Variety Meats \uf0a7 Finely Ground Chicken and Finely Ground Chicken Meat \uf0a7 Comminuted Chicken and Comminuted Chicken With Kidney and Sex Glands Removed

However, exceptions to this policy may be granted. Exceptions would require that the establishment operators develop a procedure which the assigned inspector can readily monitor to ensure correct labeling. Such procedures, accompanied by written comments from the assigned inspector and where possible, the circuit supervisor, must be forwarded to the area supervisor for review and approval. Approved procedures must be attached to the label records accompanying new or modified labels submitted for approval. See: Policy Memo 083A dated May 12, 1988

**LABELING FOR SUBSTITUTE PRODUCTS:** If a product fails to comply with a standard only because the meat or poultry content is lower than required and the product has generic identity as a nonmeat product (e.g., pizza, stew, pies), then the product may be designated by the nonmeat terminology in the standardized name (e.g., \u201cPIZZA,\u201d \u201cSTEW,\u201d \u201cPIE\u201d), provided the meat\poultry content of the product is conspicuously disclosed contiguous to the product name along with a", "statement of the amount of meat\poultry in the standardized product. (For example, PIZZA (contains 5 percent sausage; SAUSAGE PIZZA contains 12 percent sausage.) Such product may not be nutritionally inferior to the standardized product it resembles. For this purpose, nutritional inferiority is defined, consistent with the requirement of 21 CFR 101.3(e)(4), as any reduction in the content of an essential nutrient that is present at 2 percent or more of the U.S. RDA per serving of protein or any of the vitamins or minerals for which U.S. RDAs are established. A quality control procedure must be approved for such products by the Processed Products Inspection Division before the label can be used. If a product is nutritionally inferior to the standardized product it resembles, it must be labeled \u201cimitation\u201d in accordance with 9 CFR 317.2(j) and 9 CFR 381.1(b). See: Policy Memo 069 dated March 23, 1984

**LABELING OF PRODUCTS WITH GROUND OR EMULSIFIED TRIMMINGS:** The addition of small amounts of ground or emulsified ham trimmings, beef trimmings, or poultry trimmings to these products may be used without declaration. However, if poultry skin is being used to produce poultry trimmings, it may not exceed natural proportions as prescribed in 9 CFR 381.117 and 381.118 of the Poultry Products Inspection Regulations. The amount of ground or emulsified trimmings that may be used can represent no more than 15 percent of the fresh or green weight of the ham, beef, or poultry block at the time of formulation (e.g., 85 lbs. intact muscle and 15 lbs. of trimmings). These trimmings may be from a different process, however, they must be derived from like cuts or parts, e.g., emulsified round trimmings injected into product called \u201cBoneless Roast Beef Round,\u201d emulsified breast meat trimmings injected into product called \u201cBoneless Roasted Turkey Breast,\u201d or emulsified chuck trimmings injected into product called \u201cCooked Roast Beef\u201d derived from the beef chuck. The information pertaining to the source of trimmings and cut of product being used must be indicated in the product formulation on label submittals. Emulsified trimmings consist of suspending ground trimmings in a curing solution or other solutions (i.e., that impart flavor) through the use of a mechanical emulsifier, then injecting the liquid suspension directly into the whole muscle portion of the hams, beef roasts, or poultry products. The emulsified suspension must be used during the same day of production. Furthermore, a written proposal outlining processing procedures for injecting the suspensions of ham, beef, or poultry trimmings into the boneless product must be submitted by establishments, through appropriate inspection channels, to the Processed Products Inspection Division, Science and Technology, for review and approval. Such approval is a prerequisite for label use. Products containing more than 15 percent ground trimmings or emulsified trimmings

must be labeled to indicate the presence of the ground ham, beef or poultry trimmings added or emulsified ham, beef or poultry trimmings being injected, e.g., "A Portion of Ground Ham Added," "Emulsified Beef Added," "Ground Poultry Trimmings," "Added," or "Emulsified Beef Trimmings Added." Policies regarding the required use of terminology such as "chunked and formed" and "ground and formed" will continue. See: Policy Memo 041B dated February 15, 1991 LABELING OF MODIFIED BREAKFAST SAUSAGE, COOKED SAUSAGE, AND FERMENTED SAUSAGE PRODUCTS IDENTIFIED BY A NUTRIENT CONTENT CLAIM: Modified breakfast sausage, cooked sausage, and fermented sausage products are substitute versions of the standardized or traditional products that have been formulated and processed to reduce the fat contents to qualify for use of nutrient content claims, but do not comply with the standard of identity or composition as described in the meat and poultry regulations or the Standards and Labeling Policy Book (Policy Book) because of the use of ingredients used for fat replacement which are precluded or restricted by these standards. The deviation from the standard or the traditional, i.e., regular product, is conveyed by associating an expressed nutrient content claim for the appropriate reduction in fat content and the standardized or traditional product name, e.g., "Reduced Fat Frankfurter" or "Low Fat Pepperoni." The nutrient content claims that may be used are those related to a reduction in fat contents that are identified in the regulations for meat products in 9 CFR Part 317 and for poultry products in 9 CFR Part 381. Maintaining Product Integrity: The following guidelines must be applied to assure that the modified versions of the subject meat and poultry sausage products do not violate the integrity of the standardized or traditional product for which they purport to be substitutes: (1) the product must be similar in shape, flavor, consistency, and general appearance to the product as prepared according to the regulatory or traditional standard, (2) the meat or poultry used to formulate the modified product must come from the same anatomical location when the standardized term is related to an anatomical region on an animal, e.g., "ham" is expected to be from the hind leg of the hog and cured; thus, "smoked ham sausage" would be comprised of meat from the hind leg of a hog that has been smoked and cured, (3) the modified sausage product must result from the same processing procedures as those specified for the subject sausage products described by regulatory or Policy Book standards, (4) there must not be deviations from product safety criteria (e.g., salt content, curing agents, pH, water activity and/or moisture/protein ratio) that are provided in the regulatory or Policy Book standards for sausages, and (5) the modified product must achieve the appropriate reduction in fat content to be eligible to use a nutrient content claim in conjunction with the standardized or traditional product name. Performance Characteristics: In producing modified, substitute versions of sausages, the deviations from ingredient provisions of the regulatory and Policy Book standards should be the minimum necessary to qualify for the nutrient content claim while maintaining the performance characteristics similar to the standardized or traditional product, i.e., similar preparation, cooking, and handling characteristics. If a modified version of the standardized or traditional sausage does not perform in substantially the same way as the standardized or traditional item, the label must include a prominent statement informing "the consumer of such differences. For example, a "low fat frankfurter" that essentially has all of the characteristics of a frankfurter, but cannot be grilled, would indicate "not recommended for grilling." A "reduced fat pepperoni" that displays essentially all the characteristics of

pepperoni, but cannot be cooked, would, for example, indicate \u201cnot recommended for cooking\u201d or \u201cdon\u2019t cook.\u201d Safe and Suitable Ingredients: A modified, substitute sausage product must be formulated with approved safe and suitable ingredients, e.g., those identified in 9 CFR 424.21, and those determined to be safe and suitable by the Food Standards and Ingredients Branch, Product Assessment Division. Such ingredients are to be used at the lowest level necessary to achieve the intended effect of reducing fat as compared to the standardized or traditional product. Safe and suitable ingredients are those used to replace fat, improve texture, and prevent syneresis. An ingredient or component of an ingredient that is specifically required by the regulatory or Policy Book standard for characterizing purposes, e.g., cheese in a cheesefurter, fresh livers in liver sausage, cured ham in a ham sausage, and fennel or anise in an Italian sausage, shall be present in the required amount, if applicable, or otherwise in a significant amount to provide a characterizing identity to the product. Moreover, an ingredient or component of an ingredient that is not permitted by regulations for use in any meat or poultry sausage product, e.g., sodium benzoate, shall not be added to a modified, substitute product. Product Identity: The name of the modified version of the standardized or traditional product that complies with all parts of the policy prescribed herein is the appropriate expressed nutrient content claim for the meat and\or poultry product with a reduction in fat content and the applicable standardized or traditional term, e.g., \u201cLean Sausage,\u201d \u201c97 percent Fat-Free (or \u201cLow Fat\u201d Kielbasa,\u201d \u201cLow-Fat Frankfurter Made with Beef, Pork and Turkey,\u201d \u201cReduced Fat Pepperoni,\u201d \u201cExtra Lean Turkey Italian Sausage,\u201d and \u201cLite Genoa Salami.\u201d The size and style of type must conform to the nutrition labeling regulations. Ingredients Statement: To assist the consumer in differentiating between the standardized or traditional sausage product and the modified, substitute version, ingredients that are not provided for by regulatory or Policy Book standards, or used in excess of the allowable levels specified, must be appropriately identified with an asterisk in the ingredients statement. The statement(s) defining the asterisk(s), e.g., \u201c\*Ingredient(s) not in regular \u201c(fill in name of the standardized or traditional product), or \u201c\*Ingredients(s) in excess of amount permitted in regular \u201c(fill in name of the standardized or traditional product), or both as appropriate, must be legible and conspicuous, and shall immediately follow the ingredients statement in the same size and style of type. See: Policy Memo 123 dated January 20, 1995", "LABELING OF MEAT AND POULTRY STICK ITEMS: Stick items such as beef jerky, pepperoni sticks, and beef sticks must be labeled (i.e., contain the required label features as outlined in 9 CFR 317 and 9 CFR 381, Subpart N) according to the following guidelines: 1. If sold in fully labeled bulk containers, i.e., canisters, caddies, or similar containers, stick items do not have to be fully labeled unless they are individually wrapped. This type of container cannot be reused. 2. If sold in bulk containers, i.e., canisters, caddies, or similar containers that are not fully labeled, stick items must be fully labeled. Bulk containers such as these may only be refilled with fully labeled product. 3. If sold in small, fully labeled cartons, boxes, or similar containers (e.g., 3 oz., net weight) that are only intended for retail sale intact, stick items may be individually wrapped and unlabeled. See: Policy Memo 111 dated June 6, 1988 LABELING OF MODIFIED SUBSTITUTE VERSIONS OF FRESH (SPECIES) SAUSAGE, HAMBURGER OR GROUND BEEF PRODUCTS: This policy allows modified versions of fresh (species) sausages, ground beef, or hamburger to contain non-meat or poultry, \u201cfat-

replacing ingredients (e.g., binders such as carrageenan, modified food starch) and to be identified by certain nutrient content claims in accordance with nutrition labeling regulations effective on August 8, 1994, in conjunction with descriptive labeling, e.g., "Lean Pork Sausage with a X percent Solution of ..., " or "Low Fat Ground Beef, Water, and Carrageenan Product." This policy allows for the use of terms defined in regulations, e.g., "Lean," "Reduced Fat," "Low Fat," etc., to be used to describe fresh (species) sausage, ground beef, or hamburger products with a reduction in fat content resulting from the use of added ingredients (i.e., fat replacers) such as carrageenan and isolated soy protein). These products must meet the criteria for use of the nutrient content claim associated with the fat reduction. The nutrient content claim may be used in conjunction with the standardized name provided the consumer is informed of the actual components of the product through labeling, i.e., descriptive product name, ingredients statement, and Nutrition Facts. Meat products, including those that meet the criteria established for claims, such as "Lean," "Low Fat," "Lower Fat," "Reduced Fat," etc., that combine fresh (species) sausage, ground beef, or hamburger, and other safe and suitable ingredients, for the principal purpose of replacing fat, may be descriptively labeled. Examples of such products are "Lean Ground Beef, Water, and Carrageenan Product," "Low Fat Ground Beef With a X percent Solution of ..., " "Lean Beef Sausage, Water, and Carrageenan," "Product," or "Reduced Fat Pork Sausage, Water, and Binders Product," provided conditions prescribed in the regulations, viz., 9 CFR 317, for use of the nutrient content claim are satisfied. In contrast, modified versions of fresh (species) sausage, ground beef or hamburger product containing added ingredients that do not qualify for use of a nutrient content claim prescribed in the nutrition labeling regulations must be labeled as Imitation Pork Sausage, Imitation Beef Sausage, Imitation Ground Beef, Imitation Hamburger, Beef Patty or Beef Patty Mix in accordance with 9 CFR Section 317.2(j)(1) and Sections 9 CFR 319.141 (Fresh pork sausage), 319.142 (Fresh beef sausage), and 319.15 (Miscellaneous beef products), respectively. Descriptively labeled, modified, substitute versions of fresh (species) sausage, ground beef, or hamburger product with a reduction in fat content must comply with the following guidelines:

1. The descriptive name of a modified, substitute product with a reduction in fat content is the applicable nutrient content claim used in conjunction with the appropriate standardized name and fat-replacing ingredients, e.g., "Low Fat Ground Beef, Water and Carrageenan Product," or "Lean Pork Sausage with an X percent Solution of Water, Modified Food Starch, Spices, and Salt." Words in the descriptive name may be of a different size, style, color, or type but, in all cases, the words must be prominent, conspicuous, and legible. Moreover, no word in the descriptive name should be printed in letters that are less than one-third the size of the largest letter used in any other word in the descriptive name. The solution statement, when used, is considered to be part of the descriptive product name and must comply with descriptive name sizing requirements.
2. Fat-replacing ingredients (e.g., binders and water) and fat in the finished product may not exceed 30 percent of the product as formulated for the modified, substitute ground beef, hamburger, or fresh beef sausage product, and no more than 40 percent of the product formulation for the substitute fresh pork sausage. The fat content must be in accordance with requirements for use of the applicable nutrient content claim.
3. The product includes mandatory nutrition labeling prescribed in the

meat inspection regulations, viz., 9 CFR 317. 4. The product is formulated with approved safe and suitable ingredients, e.g., those identified in 9 CFR 424.21(c)(4), and which are determined to be safe and suitable by the Labeling and Consumer Protection Staff, that are used at the lowest level necessary to achieve the intended effect as a fat-replacing ingredient (i.e., binder). See: Policy Memo 121B dated January 20, 1995 LABELING OF PRODUCT NAMES, FANCIFUL NAMES, WORD SIZE: Words in product names or fanciful names may be a different size, style, color, or type, but in all cases, the words must be prominent, conspicuous, and legible. Moreover, no", "word in a product name, i.e., a common or usual name, a standardized name, or a descriptive name should be printed in letters that are less than one-third the size of the largest letter used in any other words of the product name. The same guidelines apply to letters of words in fanciful names that may accompany the product name. For example, for a product labeled Chili Mac--Beans, Macaroni and Beef in Sauce, \u201cChili Mac\u201d is the fanciful name and \u201cBeans, Macaroni and Beef in Sauce\u201d is the product name. No letter in \u201cChili Mac\u201d may be smaller than one-third the size of the largest letter in \u201cChili Mac.\u201d Similarly, no letter in the descriptive name may be smaller than one-third the size of the largest letter in the descriptive name. This policy is not intended to address the relative size of words in fanciful names versus product names. The size of words in qualifying statements, e.g., \u201cWater Added,\u201d \u201cContains up to ...,\u201d \u201cSmoke Flavoring Added,\u201d etc., are not affected by this policy memo. See: Policy Memo 087A dated September 16, 1985 LABELING OF PRODUCTS CONTAINING MEAT WITH ADDED SOLUTIONS OR OTHER NONMEAT INGREDIENTS IN SECONDARY PRODUCTS: In those situations where meat containing an added solution or other nonmeat ingredients, for example, Ham-Water Added, Cooked Corned Beef and Water Products, Uncooked Beef-Containing up to 10% of a solution of water, salt, and sodium phosphate, are used in secondary products in sufficient quantities to meet the minimum meat requirement without including the added solution, or nonmeat ingredients, the product name need not include any reference to the added solution or nonmeat ingredients; for example, Corned Beef and Cabbage would be an acceptable name for a product if the corned beef portion of the corned beef and water product was present in a sufficient quantity to satisfy the 25 percent cooked corned beef requirement. The ingredients statement, however, must include nomenclature as required by the regulations or policy (see also 9 CFR 317.2(e)(2) and 084A (Cooked Red Meat Products Containing Added Substances)). In this example, the ingredients statement would list \u201cCooked Corned Beef and Water Product-X percent of added ingredients are . . .\u201d For products in which the added solution ingredient as a whole is used to meet the minimum meat requirement, the product name must contain The appropriate nomenclature (i.e., descriptive designation for raw red meat products or containing statement for cooked red meat products above green weight) for the added solution component, for example, a product made with cooked beef with solution above green weight named \u201cBeef (containing up to 10% of a flavoring solution) Burgundy\u201d. The ingredients statement must also include the same nomenclature for the added solution meat ingredient. See: Policy Memo 102 dated January 6, 1987 (The Labeling of Products Containing Meat with Added Solutions or Other Nonmeat Ingredients in Secondary Products) LABELING OF PRODUCTS WHICH INCLUDE PACKETS OF OTHER COMPONENTS: Wording indicating that the product contains, in addition to the meat or poultry product, another component, e.g., a gravy, sauce, or seasoning packet must

appear in conjunction with the name of the product in such a manner that it is obvious to the purchaser that he","or she is also purchasing that packet along with the meat and\or poultry product. The wording must be shown in print no smaller than one-third the size of the largest letter in the rest of the product name, of such color that will insure it not being overlooked at point of purchase, and positioned contiguous to the rest of the product name, so as not to appear in whole or part on any panel except the main display panel. The net weight individual components may be shown but are not required. See: Policy Memo 099 dated September 2, 1986 LABELING OF SAFE THAWING INSTRUCTIONS ON CONSUMER PACKAGES: Thawing instructions which appear on the label of a frozen meat or poultry product must be given in accordance with FSIS' recommendations for safe thawing procedures. These procedures are as follows: 1. Thawing product in the refrigerator. 2. Thawing product in cold water, changing water every 30 minutes until product is thawed. 3. Thawing product in a microwave oven for less than 2 hours. Cook immediately. Upon request, alternative thawing procedures may be considered. However, scientific evidence which thoroughly establishes the safety of an alternative thawing procedure must be presented with the procedure when it is submitted for review. See: Policy Memo 119 dated September 28, 1989 LABELING PROMINENCE GUIDELINES FOR CURED, COOKED PRODUCTS WITH ADDED SUBSTANCES THAT DO NOT RETURN TO GREEN WEIGHT: The cured, cooked products covered by sections 9 CFR 319.100 (\u201ccorned beef\u201d), 319.101 (\u201ccorned beef brisket\u201d), 319.102 (\u201ccorned beef round and other corned beef cuts\u201d), and 319.104(a) (\u201ccured pork products\u201d under PFF) of the Federal meat inspection regulations; and by Policy Memos 057A (\u201cLabeling Turkey Ham Products Containing Added Water\u201d) and 084A (\u201cCooked Corned Beef Products and Cured Pork Products with Added Substances\u201d), whose weights after cooking exceed the weight of the fresh uncured article, shall bear the product name and qualifying statements on the principal display panel using the following guidelines: (1) The product name and the qualifying statements must be prominent and conspicuous. (2) The label will bear the product name on the principal display panel in lettering not less than one-third the size of the largest letter in terms commonly associated with","the product name, e.g., cooked, boneless, chopped, pressed, smoked, or words which could be a part of the product name, e.g., steak, butt portion, shank portion. (3) The product name will be judged prominent if the lettering is of the same style and color, and on the same color background as that which is used for the terms commonly associated with the product name or words which could be a part of the product name (see guidelines (2)). If other styles, colors, and\or backgrounds are used, the prominence must be judged equal to those terms and words which could be associated with or part of the product name. (4) The product name must be distinct and separate from other label information. Thus, the product name should not be part of or embedded in qualifying phrases or descriptions that include a list of added solution ingredients. Examples of acceptable terminology are \u201cCorned Beef and Water Product\u201d and \u201cCured Pork and X percent of a Solution.\u201d (5) The label for the products covered by this policy memo must also bear qualifying statements that conform to established policies on the size of the lettering in these statements in relation to product name (as outlined in Policy Memo 087A, FSIS Directive 7110.2, and Policy Memo 057A). See: Policy Memo 109 dated October 8, 1987 LABELING REQUIREMENTS FOR PUMP-CURED BACON PRODUCTS TREATED WITH D-OR D1-ALPHA-TOCOPHEROL IN SURFACE APPLICATIONS: Pump-cured bacon treated on the surface

with d-or d1-alpha-tocopherol must be labeled with a product name qualifier which identifies the substances involved and the method of application. The qualifier must identify both the carrier and active substance in their order of predominance. The specific names, d-or d1-alpha-tocopherol, or the term, Vitamin E, may be used in the name qualifier. Examples of acceptable name qualifiers are \u201cSprayed with a solution of vegetable oil and Vitamin E\u201d or \u201cDipped in a solution of corn oil and d-alpha-tocopherol.\u201d The name qualifier must be contiguous to the product name and printed in a style as prominent as the product name. The type used for the statement must be at least one-fourth the size of the most prominent letter in the product name, except that the ingredients of the mixture may be in print not less than one-eighth the size of the most prominent letter in the product name. The specific name of the ingredients, d-alpha-tocopherol or dl-alpha-tocopherol, and of the carrier must be listed as such in the ingredients statement or curing statement, as required by 9 CFR 317.2(f)(1). See: Policy Memo 105 dated April 13, 1987 LAMB CURRY: Product must contain at least 50 percent fresh meat.", "LANDJAEGER CERVELAT: A semi-dry sausage that originated in Switzerland. It is about the size of a large frankfurter but pressed flat, smoked and dried giving it a black appearance. LARD CONTINUOUS PROCESS: This nomenclature identifies the commodity produced from clean and sound edible tissues of swine by a low-temperature separation process in which the oil is separated from the fatty tissue by means of a combination of heat and centrifugal force. Labeling records containing the above designation should identify in detail the process and equipment used in producing the commodity. LARD -CURED PORK TISSUE USE: Cured pork trimmings may be rendered to produce lard manufactured in compliance with the lard and leaf lard standard. Rendered bacon is not acceptable in lard. See: Policy Memo 052 dated September 15, 1982 LARD REFINED: This term is applied to open-kettle rendered, prime steam, or dry-rendered lard put through a filter press, with or without bleaching agent. LASAGNA: Sauce is an expected ingredient of lasagna products and its declaration in the product name is optional. Cheese Lasagna with meat: 12 percent meat Lasagna with Meat and Sauce: 12 percent meat Lasagna with Meat Sauce: 6 percent meat in total product Lasagna with Poultry: 8 percent poultry meat Lasagna with Tomato Sauce, Cheese, and Pepperoni: 8 percent pepperoni Meat Lasagna: 12 percent meat Poultry Lasagna: 8 percent poultry meat", "LAU -LAU: Product must contain at least 25 percent meat. A Hawaiian dish made with pork and fish, wrapped in taro leaves. Label must have a true product name, e.g., \u201cPork and Fish Stuffed Taro Leaves.\u201d LEBANON BOLOGNA: A coarse ground, fermented, semi-dry sausage. If the product has a MPR of 3.1:1 or less and a pH of 5.0 or less, no refrigeration is required. It is made with beef. No extenders or hearts are permitted in the product. This is not a 9 CFR 319.180 product. LEGENDS: Products consisting of mixed meat and poultry ingredients shall bear either the official meat inspection legend or poultry legend, depending on which ingredients are present in the greater amounts. If meat or poultry ingredients exist in equal proportions, either official legend may be used. If meat and poultry ingredients exist in exact proportions and both appear in the product name, the official legend must reflect the ingredient appearing first in the product name. LENTIL SOUP WITH BACON - German Style: Acceptable name for a lentil soup containing only bacon. The bacon requirement is 4.0 percent for condensed and 2.0 percent for ready to eat. LEONA: An acceptable name. A coarse ground cooked sausage. LIMA BEANS WITH HAM OR BACON IN SAUCE: Product must contain at least 12 percent ham or bacon. See: 9 CFR 319.310 LINGUICA: A Portuguese type

sausage containing pork and excluding other meat and meat byproducts. Usually contains nonfat dry milk and condiments, e.g., vinegar, cinnamon, cumin seed, garlic, red pepper, salt, and sugar. Paprika and cures are acceptable in this product. See: Policy Memo 015A dated June 22, 1981","LINKS: This designation falls into four categories: 1. \u201cLinks\u201d without further qualification refers to an all pork fresh sausage in links. 2. \u201cLinks Sausage\u201d can be used to designate any sausage type formulation usually cured and smoked in links, except for those formulations containing poultry. (See Policy Memo 030A.) 3. \u201cLinks cereal and nonfat dry milk added\u201d usually formulated with meat and meat byproducts cured and smoked, and approved with the understanding each link is banded with an approved band label. 4. \u201cLinks, A pork and textured vegetable protein product\u201d followed immediately by the ingredients statement is acceptable. \u201cLinks,\u201d \u201cTop's Links,\u201d \u201cJoe's Links\u201d are coined names and must be followed immediately by true product name. LITTLE SMOKIES: A smoked small variety sausage link made with beef and pork. LIVER AND ONIONS: Product must contain at least 45 percent liver. LIVER, CHOPPED: Product must contain at least 50 percent liver. LIVER, ONIONS AND EGGS: Product must contain at least 40 percent liver. LIVER PRODUCTS: The product name does not have to include the species for multi-ingredient liver products, such as chopped liver, liver pate, and pureed liver. However, the species must be identified in the ingredients statement. For single ingredient liver products, such as sliced beef liver, the species must be identified in the product name. \u201cKind\u201d liver must always be identified. Products with liver in the name (except for products listed) must contain a minimum of 30 percent liver.", "LIVER SPREAD (STREICH LEBERWURST): The product name \u201cLiver Spread (Stretch Leberwurst)\u201d is acceptable. Product name must contain at least 30 percent liver in total formulation. LIVERWURST OR \u201cPATE DE FOIE -STYLE LIVERWURST\u201d: Product must meet liver sausage requirements. (See Regulation 9 CFR 319.182) LOAF: A \u201cLoaf\u201d (other than meat loaf) consists of meat in combination with any of a wide range of nonmeat ingredients. These products are not identified with the term \u201cMeat Loaf,\u201d \u201cBeef Loaf,\u201d or the like but with designations, e.g., \u201cOlive Loaf,\u201d \u201cPickle and Pimiento Loaf,\u201d \u201cHoney Loaf,\u201d \u201cLuxury Loaf,\u201d and others that are descriptive. LOAF, CANNED, PERISHABLE: Canned perishable products in the loaf category must: 1. Meet the perishable requirements. (See 9 CFR 317.2(k).) 2. Show a brine concentration of not less than 3.5 percent in finished product. Show a brine concentration of not less than 6.0 percent when the products contain cereal, starch, or other extenders. 3. Be cooked to a minimum internal temperature of at least than 150o F. 4. When extenders are added the product name must be qualified, e.g., \u201c(Name of extender) added.\u201d LOLA AND LOLITA (IT): Dry sausage products of Italian origin. Consists of mildly seasoned pork and contains garlic. Lolita comes in 14 oz. links, while Lola comes in 2 1\2 lb. links. LONDON BROIL: Name can only be applied to a cooked product. Products including the expression \u201cLondon Broil\u201d on labels must be prepared with beef flank steak. Uncooked product must be labeled to indicate this, e.g., \u201cBeef Flank Steak for London Broil.\u201d If prepared from another cut, the identity of that cut must accompany the term \u201cLondon Broil,\u201d e.g., \u201cSirloin Tip London Broil.\u201d", "LONG ISLAND STYLE OR TYPE: Not acceptable for poultry products. LONGANIZA: Longaniza is a fresh sausage product. If it is prepared otherwise, the product name must indicate its nature, e.g., \u201cCured

Longaniza.\u201d Paprika is an acceptable ingredient because it is expected. LONGANIZA AND PUERTO RICAN STYLE LONGANIZA: Longaniza is an acceptable name for Puerto Rican sausage made from pork which may contain beef but does not contain annatto. Added fat is not permitted. Puerto Rican Style Longaniza is acceptable labeling for sausage made from pork which may contain beef and does contain annatto. Added fat is not permitted, although up to 3 percent lard may be used as a carrier for annatto. When annatto is used, it should be included in the ingredients statement as \u201cannatto\u201d in accordance with Section 9 CFR

317.2(j)(5) of the meat inspection regulations. See: Policy Memo 021 dated February 9, 1981

LOUKANIKA: An acceptable name for cooked fresh Greek sausage. It is usually made with lamb and pork, oranges, allspice, whole pepper, and salt. LUMPIA or LOOMPYA: A Philippine style or Filipino style egg roll. There are no special ingredient requirements; it refers to a shape of the egg roll. Lumpia or Loompya are generally longer and thinner than traditional egg rolls.

LUNCHEON MEAT: 1. \u201cLuncheon Meat\u201d cannot contain livers, kidneys, blood, detached skin, partially defatted pork or beef tissue, or stomachs. 2. On the label the meat components of \u201cLuncheon Meat\u201d are identified in the ingredients statement as \u201cbeef,\u201d \u201cpork,\u201d \u201cbEEF tongue meat,\u201d \u201cpork tongue meat,\u201d \u201cbEEF heart meat,\u201d and \u201cpork heart meat.\u201d 3. In the ingredients statement \u201cBeef\u201d and \u201cPork\u201d means lean meat with overlying fat and the portions of sinew, nerve, and the blood vessels which normally accompany muscle tissue and which are not separated in the process of dressing","but not including bone and skin. Up to 10 percent of the meat portion of the formula can consist of cured and smoked meat trimmings which does not require special declaration in the ingredients statement except included under \u201cpork\u201d and \u201cbeef.\u201d 4.

Heart or heart muscle, tongues, or tongue meat and cheek meat can be included in \u201cLuncheon Meat\u201d under the following restrictions: a. Hearts or heart meat or tongues or tongue meat must be declared individually by species in the ingredients statement on the label. b. No restriction on the percentage limits of hearts, heart meats, tongues, and tongue meats in the formulation. c. The terms \u201cheart meat\u201d and \u201ctongue meat\u201d refer to the muscle tissue remaining after heart caps, glands, nodes, connective tissue, etc. are trimmed away. 5. Water added to \u201cLuncheon Meat\u201d during manufacture cannot exceed 3 percent by weight of the total ingredients, this is controlled by weighing ingredients and not by analysis. Care must be used to see that water is not added indirectly through the use of undrained hearts and tongues. 6. The only ingredients permitted in \u201cLuncheon Meat\u201d are curing ingredients, sweetening agents, spices, and flavoring. All of these substances must be declared in the ingredients statement by name, except the various \u201cflavorings\u201d and \u201cspices\u201d which need not be named individually. \u201cSpices\u201d refer to natural spices and not to extracts. LYONER WURST: A

cooked, smoked, and finely ground sausage originating in Germany. It is usually made with

beef, pork, (no chicken) flavoring, cure, and contains green peppercorns. LYONS SAUSAGE (FR):

A dry sausage made exclusively of pork (four parts finely chopped lean and one or two parts small diced fat) with spices and garlic which is stuffed into large casings, cured and air-dried. MACARONI AND BEEF IN SAUCE: Product must contain at least 12 percent beef.", "MACARONI AND CHEESE WITH HAM: Product must contain at least 12 percent cooked ham. MACARONI SALAD WITH (Meat or Poultry): Product must contain at least 12 percent cooked meat or

poultry meat. MADE WITH \u2026 QUALIFIERS: Need only mention the species or kind in the statement even when only a byproduct of the specific species or kind is used, e.g., pork, chicken and beef hearts in a sausage would carry a qualifier \u201cmade with pork, chicken and beef.\u201d MADE WITH 100 percent REAL CHEESE: This statement is acceptable on products as long as the cheese components are all 100 percent real cheese. It is not acceptable if a cheese food product or imitation cheese is included in the formula. MALIC ACID: Malic acid has been used extensively for many years as part of flavoring\//seasoning mixtures which are added to components of meat or poultry products. It may be approved as a flavoring agent, and is acceptable as a component in a seasoning mix, e.g., in marinades and sauces, but may not be added alone to a product. MANICOTTI (IT): Product must contain at least 10 percent fresh meat. An Italian main dish consisting of rectangular-shaped pasta spread with a filling of meat (e.g., sausage, ground beef, or chopped prosciutto) and\//or cheeses (e.g., ricotta and mozzarella). The pasta is rolled, edges pressed to seal, and covered with grated parmesan cheese and tomato sauce. A true product name must be shown, e.g., \u201cBeef Manicotti in Sauce.\u201d MARGARINE SUBSTITUTES: Meat food products that are substitutes for margarine because they contain less than 80 percent fat and\//or oil need not be labeled \u201cimitation\u201d if the product has a fully descriptive name and the finished product contains 15,000 international units of Vitamin A per pound. The descriptive name of the product may include the term \u201cSpread\u201d (or \u201cSpred\u201d), which has been widely adopted as a generic fanciful name for this class of product.", "The following guidelines shall be used in selecting the appropriate descriptive product name: 1. \u201cAnimal Fat Spread (or Spred)\u201d is an acceptable product name for a product prepared from animal fat as the sole source of fat. 2. \u201cAnimal Fat and Vegetable Oil Spread (or Spred)\u201d is an acceptable product name for a product prepared with a combination of animal fat(s) and vegetable oil(s) in which the vegetable oil(s) content is greater than 20 percent of the total of the fat(s) and oil(s) used but less than 50 percent of the total. 3. \u201cAnimal Fat Spread (or Spred) -Vegetable Oil Added\u201d is an acceptable product name for a product prepared with a combination of animal fat(s) and vegetable oil(s) in which the vegetable oil(s) content is 20 percent or less of the total of the fat(s) and oil(s) used but greater than 2 percent of the total. 4. The fanciful name \u201cSpread\u201d (or \u201cSpred\u201d) accompanied by a list of all ingredients individually identified by their common or usual name in order of decreasing predominance is acceptable regardless of the nature and amount of fat(s) and\//or oil(s) used. In 1., 2., and 3. above, the descriptive product name may include the percent of each fat and\//or oil and may include the common or usual name of each fat and\//or oil used. See: Policy Memo 045 dated April 7, 1982 MARENGO: Product must contain at least 35 percent cooked meat or poultry meat. It has chicken or veal in a sauce containing tomatoes, mushrooms, onions, and wine, and label must show true product name, e.g., \u201cChicken Marengo.\u201d MARINE OIL: Herring oil and other marine species oils found by FDA to be satisfactory may be combined with animal and mixture of animal and vegetable oils processed as meat food products. Labels will bear statements identifying the presence of such substances, e.g., a shortening consisting of 50 percent herring oil and the remainder equal amounts of animal and vegetable oils would be \u201cShortening, Prepared with Herring Oil, Animal and Vegetable Oils.\u201d MARKING: Labeling may consist of a combination of printing, stenciling, box dyes, etc. for large true containers and for shipping containers. Crayons are unacceptable for applying required labeling

features except for figures indicating content quantity. Approval of official marks appearing in newspaper advertisements, billboards, etc. is not necessary; however, such marks may be reviewed locally before publication. Such markings should conform to the illustrations in the regulations and not be misleading.", "\u201cMAY CONTAIN\u201d STATEMENTS: The use of \u201cmay contain\u201d or \u201cand\u201d labeling may be used in the ingredients statement\u2019s sublisting of sliced and\u201d or diced products from various sources. See: \u201cComposite Ingredients Statement.\u201d MEAT AND DRESSING: Product must contain at least 50 percent cooked meat. MEAT AND DRESSING WITH GRAVY: Product must contain at least 30 percent cooked meat. MEAT BASE: A granular, paste-like product which is shelf-stable primarily because of its high salt content (30-40 percent). 1. Beef Base -15 percent beef or 10.5 percent cooked beef 2. Pork Base -15 percent pork or 10.5 percent cooked pork 3. Ham Base - 18 percent ham MEAT BROTH OR MEAT STOCK: MPR 135:1. Condensed 67:1 MEAT BYPRODUCTS: Byproducts must be individually declared by species and specific name in the ingredients statement, e.g., Pork Liver, Beef Tripe, and Beef fat.", "MEAT CASSEROLES: Product must contain at least 25 percent meat or 18 percent cooked meat. MEAT CURRY: Product must contain at least 50 percent meat. MEAT FLAVORING: Meat flavoring \u2013 when characteristic meat flavorings such as bacon are added in amounts less than 2 percent in addition to the required meat component of a product, such meat flavorings need not appear in the product label. MEAT FOLDOVER MIT DRESSING: Product must contain at least 50 percent meat (chopped and formed). MEAT FOOD PRODUCTS CONTAINING POULTRY INGREDIENTS - LABELING: Meat food products containing poultry ingredients in amounts that exceed 20 percent of the total livestock and poultry product portion of the meat food product must have product names that indicate the presence of the poultry ingredients, e.g., \u201cBeef and Chicken Chili\u201d or \u201cChili made with Beef and Chicken.\u201d Meat food products containing poultry ingredients in amounts at 20 percent or less of the total livestock and poultry product portion of the meat food product must have product names that are qualified to indicate the presence of the poultry ingredients, e.g., \u201cBeef Stew -Turkey Added.\u201d However, meat food products that do not meet specified minimum livestock ingredient requirements because poultry ingredients are replacing any part of the required livestock ingredients must have product names that indicate the presence of the poultry ingredients, e.g., \u201cBeef and Turkey Stew\u201d or \u201cStew Made with Beef and Turkey.\u201d This policy does not apply to: (1) red meat products that are expected to contain poultry ingredients, e.g., \u201cBrunswick Stew and Potted Meat Food Product\u201d (Section 9 CFR 319.761); (2) cooked sausages identified in Section 9 CFR 319.180 of the meat regulations (Policy Memo 005A); or (3) nonspecific loaves, rolls, logs, etc., e.g., Pickle and Pimento Loaf. See: Policy Memo 030A dated September 13, 1982", "MEAT LOAF: Uncooked or cooked pork, beef, veal or lamb, and other ingredients in loaf form, but not canned. 1. Ingredients, e.g., cracker meal, oatmeal, bread crumbs, nonfat dry milk, soy ingredients (untextured), milk, and whole eggs are not required in the product name. 2. Product may contain: a. Head meat, cheek meat, heart meat, and tongue meat under label declaration in the ingredients statement only. b. Not more than 12 percent extenders and binders. c. Partially defatted chopped beef or pork up to 25 percent and declared as meat in the ingredients statement. 3. Product must contain at least 65 percent meat. 4. Onion, tomato juice, water, and other liquid extenders are not directly controlled. MEAT LOAF, CANNED (Perishable): Canned perishable products in the loaf category

must: 1. Meet the perishable labeling requirements. See: 9 CFR 317.2(k), 2. Be cured with at least 1 ounce nitrate per 100 pounds of product and 1½ percent dextrose or 1 percent sugar. 3. Have a brine concentration of at least 3.5 percent in the finished product. Products that contain cereal, starch, or other extenders must have a brine concentration of at least 6.1 percent. MEAT LOAF, CANNED (Sterile Packed): No head, cheek, heart, or tongue meat permitted. Other requirements are the same as uncanned cured meat loaf. Binders and extenders must be shown in the product name, e.g., Meat Loaf, cereal added.

MEAT PASTY OR PASTIES: Product must contain at least 25 percent meat. The label must show the true product name, e.g., Beef Pasty.

MEAT PIE FILLING: Product must contain at least 37 percent meat.

MEAT PIES (OR VEGETABLE MEAT PIES): Product must contain 25 percent meat; meat in gravy may be counted towards meat content.

MEAT/POULTRY EXTENDED PRODUCTS: These should always be listed in the ingredients statement of the secondary product by their correct name, e.g., Beef, water and binder product, unless it is included in the name of the product, e.g., Chili made with beef and binder product.

MEAT RAVIOLI: Product must contain at least 10 percent meat in ravioli.

MEAT RAVIOLI IN MEAT SAUCE: Product must contain at least 10 percent meat in ravioli and at least 50 percent ravioli in total product, and at least 6 percent meat in sauce.

MEAT RAVIOLI IN SAUCE: Product must contain at least 10 percent meat in the ravioli and at least 50 percent ravioli in the total product.

MEAT SAUCE: Product must contain at least 6 percent ground meat.

MEAT SPREADS: Product must contain at least 50 percent meat or 35 percent cooked meat. When another major component is considered a significant source of protein such as cheese is added the requirement is reduced to 25 percent cooked meat. Product must show a true product name, e.g., Sausage and Cheese Spread.

MEAT STICK AND CHEESE COMBINATION PRODUCTS: The following criteria are used for dry meat stick and cheese combination products that need not bear a "keep refrigerated" handling statement.

(1) The dry meat stick portion must have a water activity of less than 0.90, the cheese portion must have a water activity of less than 0.94, and the equilibrium of the water activity of the two components must be no greater than 0.92;

(2) the dry meat portion, if fermented, must be fermented by an active fermentation culture (typically to a pH 5.0 or below) and;

(3) for products where the meat portion and the cheese portion are packaged together, there must be a heat seal between the dry meat stick and cheese components which separates the meat stick from the cheese stick by at least 4 mm.

(4) Dry meat stick and cheese combination products not meeting these criteria must be labeled with a "keep refrigerated" statement in lieu of compelling data that establish safety. Products not meeting the criteria stated above can be labeled without a "keep refrigerated" statement if a control program ensuring safety and shelf stability is established by the established.

MEATBALL STEW: Meatball stew contains at least 25 percent meatballs and usually contains vegetables such as potatoes, peas, carrots, etc., and gravy or thick broth resulting from cooking all ingredients together. The meatballs must meet the Meatball Standard.

MEATBALLS: Uncooked or cooked pork, beef, veal, and lamb, and other ingredients in a ball form.

1. Product must contain at least 65 percent meat.

2. Binders and extenders are limited to 12 percent of the total product. 6.8 percent of isolated soy protein is considered the equivalent to 12 percent of the other binders or extenders. The permitted binders and extenders include, but are not limited to, cereal, bread crumbs, cracker meal, soy flour, soy protein concentrate, isolated soy

protein, and textured vegetable protein. 3. Cheeks, hearts, and tongues are not allowed, but product may contain head meat, cheek meat, heart meat, and tongue meat when declared in the ingredients statement. 4. Partially defatted chopped (PDC) (species) may be used up to 25 percent of the meat block. PDC (species) can be identified as (species) in the ingredients statements. (See entry for Partially Defatted Chopped (species).)"**MEATBALLS IN SAUCE:** Requires a 50 percent minimum of meat-balls, by weight in finished product. **MEATBALLS, SWEDISH STYLE:** Product must contain at least 65 percent fresh meat. \u201cSwedish Meatballs\u201d or \u201cSwedish Style Meatballs\u201d are small in size and usually contain two or three different varieties of meat, nutmeg and\or allspice, potatoes, and milk. \u201cSwedish Brand Meatballs Made in USA\u201d means any meatball. **MEATBALLS, TURKEY:** Product must contain at least 65 percent raw turkey meat. Skin is permitted in natural proportions of meat used, if skin is in excess of natural proportions, it shall be reflected in the product name. **MEDITERRANEAN STYLE:** Acceptable identification for product containing onion or garlic, olive oil and four of any of the following groups: 1. Vegetable or fruit: dried apricot, artichoke, dried date, dried fig, eggplant, tomato, pepper (green or red), squash, lemon or lemon juice, raisin and olives. 2. Legume or nut: fava bean, chick pea, white cannelloni bean, green bean, lentil, almond, pine nut, pistachio. 3. Seasoning: dill, coriander, cinnamon, cumin, fennel, basil, oregano, thyme, saffron, rosemary, parsley, mint, sumac, turmeric. 4. A regional dish as component, e.g., pita bread, yogurt, Italian or Greek type cheese, pasta, couscous or bulgur. **MERGUEZ, MERGUES OR MERGHEZ SAUSAGE:** A hot and spicy fresh sausage originating in North Africa and common in France which contains hot pepper and\or paprika. The meat component must contain beef and may contain lamb or mutton when labeled as \u201cMerguez Sausage.\u201d When pork is used as part of meat component, the product is labeled as \u201cMerguez Sausage with Pork.\u201d When pork is the only meat ingredient, the product is labeled \u201cPork Merguez Sausage.\u201d", "**METTWURST:** An uncooked cured smoked sausage in which byproducts and extenders are not permitted. Beef heart meat is acceptable. Water is limited to 3 percent and the fat content shall not exceed 50 percent. See: Policy Memo 020A dated March 26, 1981 **METTWURST, COOKED:** Mettwurst which is cooked must be labeled \u201cCooked Mettwurst,\u201d and may contain up to 10 percent water based on the finished product. See: Policy Memo 020A dated March 26, 1981 **METZ SAUSAGE:** Cured lean beef and pork and bacon are finely chopped, seasoned, and stuffed into beef middles. It is air-dried for 5 days, then given a cool smoke. It is classed as a semi-dry sausage. **MEXICAN STYLE:** Acceptable for products that contain at least four of the following: jalapeno peppers, chili peppers, green chilies, cumin, cayenne peppers, red or green peppers, chili powder, jalapeno powder, Monterey Jack cheese, or cheddar cheese. This policy applies to a single food and does not supersede Policy Memo 068. **MEXICAN STYLE DINNERS:** Products like tamales, enchiladas, and tacos must make up 25 percent of the dinner or entree to qualify as \u201cMexican Style.\u201d The individual product standard must also be met. **MEXICAN STYLE SAUCES:** A garnish (decoration) of cheese in or on the sauce of Mexican style foods does not require the presence of the cheese to be declared in the product name or qualifying statement. **MILAN OR MILANO SALAMI:** A dry sausage with a maximum MPR of 1.9:1. It is an Italian-type salami, except the meat is finely cut. It is made with beef, pork fat, spiced with garlic, and has a distinctive cording.", "**MINCE MEAT:** Product must contain at least 12 percent fresh meat or 9 percent cooked meat. Heart meat may be substituted. In addition to

\u201cMince Meat,\u201d the product name should include kinds of meat, e.g., \u201cMince Meat with Beef\u201d or \u201cMince Meat with (species) Heart Meat.\u201d When 2 percent or more cooked meat but less than 9 percent cooked meat is present in the formula, the product is amenable and the name must state that the product is \u201cMince Meat Flavored With .\u201d A product marketed as \u201cMince Meat\u201d which contains less than 2 percent cooked meat or contains only beef suet as the ingredient of animal origin, is not considered as a meat food product and is not amenable. MIXTURES: Mixtures of nonfat dry milk (NFDM), calcium reduced dry skim milk (CRDSM), or dried whey, reduced lactose whey, reduced minerals whey, and whey protein concentrate with other substances are not allowed, except in batter and gravy mixes and batters. Mixtures of cereal, soy preparations and/or sodium caseinate with other substances are permitted to come into the plant for use in batter and gravy mixes, but they must be labeled to show their intended use, e.g., \u201cPatty Mix\u201d or \u201cGravy Mix.\u201d The labels of the mixtures must show the ingredients in order of their predominance. MOCK DRUMSTICKS: An imitation product; nonspecific. MOCK TURTLE SOUP: Product must contain at least 10 percent beef and may be made with beef and beef byproducts. MOFONGO: Pork skins and plantain type product with at least 20 percent pork skins in the total formulation. It must show true product name, e.g., \u201cPork Skin Filling Wrapped in Plantain.\u201d", "MOISTURE PROTEIN RATIO (MPR)": Frizzes 1.6:1 Ukrainian Sausage 2.0:1 Jerky 0.75:1 Kippered Beef 2.03:1 Pepperoni 1.6:1 Dry Salami 1.9:1 Dry Sausage 1.9:1 Genoa Salami 2.3:1 Tropic Cure Pork 3.25:1 Sicilian Salami 2.3:1 Thuringer 3.7:1 Italian Salami 1.9:1 Dried Meat 2.04:1 Roast Beef, Canned 2.25:1 Chipped Beef 2.04:1 Farmer Summer Sausage 1.9:1 MOISTURE PROTEIN RATIO (MPR) -PH: Nonrefrigerated or shelf-stable sausages must have an MPR of 3.1:1 or less and a pH of 5.0 or less, unless commercially sterilized. This does not apply to products containing more than 3.5 percent binders or 2 percent isolated soy protein. MONDONGO: A mixture of one or more of the following: (a) beef tripe, (b) cattle feet with or without hide on, (c) chitterlings, and (d) beef intestines. See: Beef Tripe Stew MORCELLA BLOOD PUDDING: Nonspecific. The product is made from pork fat, beef blood and/or pork blood, and may contain meat. MORTADELLA: Normally a cooked sausage but can be dry or semi-dry. It is similar to salami and cervelat except that it has large chunks of pork fat. Red sweet peppers up to 4 percent and pistachio nuts up to 1 percent are acceptable as long as they are shown in the true product name. MORTADELLA (CANNED): Canned items designated \u201cMortadella\u201d must be labeled with the phrase \u201cPerishable, Keep Under Refrigeration\u201d and must have an MPR of 3.85:1 or less. See: Manual 18.46", "MORTADELLA -POULTRY: Poultry Mortadella is a dry, semi-dry, or cooked sausage formulated with poultry. The sausage must contain large chunks of pork fat and may contain extenders and/or binders. Red sweet peppers are permitted up to 4 percent and pistachio nuts up to 1 percent and shown as added in the true product name. See: Policy Memo 029 If product is canned, the MPR must not exceed 3.85:1, the internal temperature must have reached 160o F and the product labeled \u201cPerishable, Keep Under Refrigeration\u201d or similar wording. MORTADELLA WITHOUT FAT CUBES OR CHUNKS: Product must meet the standard for Mortadella and the label be qualified to indicate the absence of Fat Cubes or Chunks, e.g., \u201cMortadella without Fat Cubes\u201d or \u201cMortadella without Fat Chunks.\u201d MOUSAKA, MOUSSAKA, MUSAKA (GK): Must contain at least 25 percent meat. Mousaka is a casserole containing layers of meat and eggplant made in various ways throughout the Middle

East. A true product name is required, e.g., \u201cEggplant and Meat Casserole.\u201d MULLICATAWNY SOUP: Product must contain at least 2 percent cooked poultry meat and enough curry powder and pepper to characterize the product. The label must show a true product name, e.g., \u201cChicken Mullicatawny Soup.\u201d MULLIGAN STEW: Product must contain at least 25 percent fresh meat or meat and poultry. Mulligan stew is a mixture of vegetables and meat combined in a gravy or sauce. The label must have a true product name, e.g., \u201cChicken and Meat Mulligan Stew.\u201d MUSTARD BRAN: This is not considered a spice and must be declared as \u201cMustard Bran.\u201d It is not acceptable in sausage.

MUSTARD FLOUR: It is a spice that is commonly used in sausage products." , "MYVACET: (Distilled Acetylated Monoglycerides). Acceptable for use as a coating on sausage casings. Sausages coated with Myvacet shall show, adjacent to the product name, a qualifying statement disclosing the presence of the compound, e.g., \u201cSummer Sausage Coated with a Solution of Distilled Acetylated Monoglycerides.\u201d NACHO STYLE, NACHO FLAVOR, AND SIMILAR TERMS: Acceptable terminology for products possessing the commonly expected flavor characteristics associated with \u201cNachos,\u201d a Mexican hors d'oeuvre. The characterizing flavor components generally include, but are not limited to, cheese (Cheddar or Monterey Jack), tomato (tomato solids, tomato powder), spices, or other natural seasonings and flavorings (usually garlic and onion), and chili peppers (mild or hot). Romano and Parmesan cheese are also often present. However, these cheeses may not be used to satisfy the above cheese requirement.

NATURAL CLAIMS: The term \u201cnatural\u201d may be used on labeling for meat products and poultry products, provided the applicant for such labeling demonstrates that: (1) the product does not contain any artificial flavor or flavoring, coloring ingredient, or chemical preservative (as defined in 21 CFR 101.22), or any other artificial or synthetic ingredient; and (2) the product and its ingredients are not more than minimally processed. Minimal processing may include: (a) those traditional processes used to make food edible or to preserve it or to make it safe for human consumption, e.g., smoking, roasting, freezing, drying, and fermenting, or (b) those physical processes which do not fundamentally alter the raw product and\or which only separate a whole, intact food into component parts, e.g., grinding meat, separating eggs into albumen and yolk, and pressing fruits to produce juices. Relatively severe processes, e.g., solvent extraction, acid hydrolysis, and chemical bleaching would clearly be considered more than minimal processing. Thus, the use of a natural flavor or flavoring in compliance with 21 CFR 101.22 which has undergone more than minimal processing would place a product in which it is used outside the scope of these guidelines. However, the presence of an ingredient which has been more than minimally processed would not necessarily preclude the product from being promoted as natural. Exceptions of this type may be granted on a case-by-case basis if it can be demonstrated that the use of such an ingredient would not significantly change the character of the product to the point that it could no longer be considered a natural product. In such cases, the natural claim must be qualified to clearly and conspicuously identify the ingredient, e.g., .all natural or all natural ingredients except dextrose, modified food starch, etc.\u201d , "All products claiming to be natural or a natural food should be accompanied by a brief statement which explains what is meant by the term natural, i.e., that the product is a natural food because it contains no artificial ingredients and is only minimally processed. This statement should appear directly beneath or beside all natural claims or, if elsewhere on the principal display panel; an asterisk should be used to tie

the explanation to the claim. The decision to approve or deny the use of a natural claim may be affected by the specific context in which the claim is made. For example, claims indicating that a product is natural food, e.g., \u201cNatural chili\u201d or \u201cchili - a natural product\u201d would be unacceptable for a product containing beet powder which artificially colors the finished product. However, \u201call natural ingredients\u201d might be an acceptable claim for such a product. Correction: In the August 2005 edition of the Policy Book, a \u201cNote\u201d was added to the entry on \u201cnatural claims\u201d indicating that \u201cSugar, sodium lactate (from a corn source), and natural flavorings from oleoresins or extractives are acceptable for \u201call natural\u201d claims. The Note was followed by other new text that stated \u201cThis entry cancels Policy Memo 055 dated November 22, 1982. See: 7 CFR NOP Final Report, Part 205.601 through 205.606 for acceptable ingredients allowed for all natural claims.\u201d This \u201cNote\u201d is now revised to read as follows: Note: Sugar and natural flavorings from oleoresins or extractives are acceptable for \u201call natural\u201d claims. The other text, including the reference to \u201csodium lactate (from a corn source)\u201d has been removed from the guidance on \u201cnatural claims\u201d for the reasons explained below. The note regarding sodium lactate (from a corn source) was added to the \u201cnatural\u201d entry in recognition that manufacturers could show that the ingredient was from a natural source (i.e., from corn), was no more than minimally processed, and provided a flavoring effect, not an antimicrobial effect, at levels consistent with those regulated for the purpose of flavoring (i.e., less than 2 percent of a formulation). Thus, the Agency considered such uses to be consistent with the meaning of \u201cnatural.\u201d However, recent information provided to FSIS raises questions about this judgment. This information indicates that sodium lactate, potassium lactate, and calcium lactate provide an antimicrobial effect at levels that have been regulated as providing a flavoring effect. Therefore, regardless of whether it can be shown that any form of lactate is from a natural source and is not more than minimally processed, the use of lactate (sodium, potassium, and calcium) may conflict with the meaning of \u201cnatural\u201d because it may be having a preservative effect at levels of use associated with flavoring. Thus, listing \u201csodium lactate (from a corn source)\u201d in the previous entry may have been in error, at least without qualifying the listing by stating that the use of this ingredient or any ingredient known to have multiple technical effects needs to be judged on a case-by-case basis at the time of label approval to assess that the intended use, level of use, and technical function are consistent with the 1982 policy. Whether there should ever be a blanket acceptance of any ingredient that has multiple functions, including an antimicrobial or preservative function, in products labeled \u201cnatural\u201d is a complicated issue that is best addressed through notice and", "comment rulemaking. Therefore, FSIS has removed the reference to sodium lactate from this guidance but will judge claims that foods to which a lactate has been added can be characterized as \u201cnatural\u201d on a case-by-case basis, pending the outcome of a rulemaking on the use of \u201cnatural\u201d that the Agency intends to initiate in the near future. This correction also removes the statement in the entry on \u201cNatural Claims,\u201d \u201cSee: 7 CFR NOP Final Report, Part 205.601 through 205.606 for acceptable ingredients allowed for all natural claims.\u201d This statement was intended to help manufacturers locate a source to support the claims that ingredients they use in \u201cnatural\u201d products are not more than minimally processed, are not artificial or

synthetic, and do not act to preserve products. The Agency has removed this text because it was confusing users of the policy guidance who thought that any ingredient that is \u201corganic\u201d could be used in a \u201cnatural\u201d product, which is not the case.

**NATURAL SMOKED COLOR:** Approval can be properly granted to labels with this statement when the products involved are \u201cSmoked\u201d and not artificially colored. The results of the use of artificial smoke materials can, by means of a number of processing operations, result in a color characteristic being acquired by the frankfurters, bologna, and the like. The term \u201cNatural Smoked Color\u201d can be used to properly identify this point.

**NAVARIN:** Navarin is a stew containing lamb or mutton and vegetables and considered a national dish of France. It must meet the meat stew standard of 25 percent meat. Show true product name, e.g., \u201cNavarin-Lamb Stew.\u201d

**NEGATIVE LABELING:**

- (1) Negative labeling is allowed if it is unclear from the product name that the ingredient is not present. For example, the use of the term \u201cno beef\u201d on the label of \u201cturkey pastrami\u201d would further clarify that the product does not contain beef.
- (2) Negative labeling is allowed if the statement is beneficial for health, religious preference, or other similar reasons. For example, highlighting the absence of salt in a product would be helpful to those persons on sodium-restricted diets.
- (3) Negative labeling is allowed if the claims are directly linked to the product packaging, as opposed to the product itself. For example, flexible retortable pouches could bear the statement \u201cno preservatives, refrigeration or freezing needed with this new packaging method.\u201d
- (4) Negative labeling is allowed if such claims call attention to the absence of ingredients because they are prohibited in a product by regulation or policy. The statement must clearly and prominently indicate this fact, so as not to mislead or, "create false impressions. For example, \u201cUSDA regulations prohibit the use of preservatives in this product\u201d would be an acceptable statement for ground beef.
- (5) Negative labeling is allowed to indicate that absence of an ingredient when that ingredient is expected or permitted by regulation or policy. This could also apply to ingredients which are not expected or permitted by regulation or policy if the ingredients could find their way into the product through a component. For example, the use of \u201cno preservatives\u201d on the label of \u201cspaghetti with meat and sauce\u201d (where regulations do not permit the direct addition of preservatives) would be acceptable if the product contained an ingredient, such as cooking oil, which could contain antioxidants but do not. These guidelines do not preempt the requirements of the nutrition labeling regulation. Therefore, negative claims such as \u201cunsalted\u201d would have to comply with the provisions stated in the nutrition labeling regulations. See Policy Memo 019B dated August 18, 1994.

**NET QUANTITY OF CONTENTS ON COMBINATION PACKAGES:** The guidelines for stating the net quantity of contents on combination packages containing both liquid and solid products are as follows:

1. The declaration of net quantity of contents for a combination package shall be expressed in terms of fluid measure for individual products that are liquid and in terms of avoirdupois weight for individual products that are solid, semisolid, or viscous, provided the quantity statements for identical packages or units are combined. For example, the fruit drink would be expressed in fluid measure and the meat, cheese, crackers, and cookies would be expressed in the combined avoirdupois weight.
2. The declaration of quantity shall be preceded by one of the following terms, as appropriate: \u201cNet Weight,\u201d \u201cNet Wt.,\u201d or \u201cNet Contents.\u201d The net quantity of contents declaration may appear in more than one line.

Therefore, both stacked and side-by-side declarations would be considered appropriate. - Descriptive terms may be used to identify the liquid and solid components of the package, e.g., entree, meal, or drink; however, such terms shall not include brand names. -Connecting words such as \u201cand\u201d or \u201cplus\u201d are permitted to be used as part of the declaration of contents. Examples of acceptable net content declarations are as follows: (1) Entree Net Wt. 8 oz., Drink 4 fl. oz. (120ml)", "(2) Net Contents: lunch 8 oz. plus fruit drink 4 fl. oz. (3) Net Wt. 8 oz. Drink 4 fl. oz. (120ml) (4) Net Weight 8 oz. and 4 fl. oz. Federally inspected meat and poultry products are exempt from the requirements of the Fair Packaging and Labeling Act (FPLA), including the mandatory metric labeling provisions that went into effect February 14, 1994. However, if metric labeling is included voluntarily, such labeling should comply with the FPLA. The guidelines contained in this policy memo will be subject to the provisions prescribed in 9 CFR 317.2(h) and 9 CFR 381.121 of the Federal regulations. See: Policy Memo 124 dated January 17, 1995 NET WEIGHT STATEMENT: Divider Pak: On a product where two cans are taped together, one of which contains the meat or poultry item and the other a vegetable, e.g., \u201cChicken Chow Mein,\u201d the meat or poultry label may include the net weight on the 20 percent panel. The vegetable can bears the true name of the product with the total net weight of the other can and the drained weight of the vegetable can. Double Packing: When a poultry product and a non-poultry product are separately wrapped and placed in a single immediate container bearing the name of both products, the net weight shown on the immediate container may be the total net weight of the two products or the net weight of the poultry product and the non-poultry product separately. Additional Net Weight Information: Nonregulatory information of a net weight nature, e.g., 4-3 oz. packages, accompanying a net weight statement is acceptable and need not adhere to the size and spacing restrictions. Open Net Weights: Open net weights may be presented in pounds and ounces, decimals, decimal fractions, or fractions, e.g., 1 1\2 lbs., 1.6 lbs. Net Weight Requirements: The statement of net quantity of contents is required on all products intended for sale at retail intact. In addition, shipping containers must bear a net quantity of contents statement if product inside is not uniform in weight (i.e., random weight). Piece counts may not be used in lieu of a required net quantity of contents statement on a shipping container but may be used as additional information. Multi-Unit Retail Packages: Fully labeled packages of more than one of the same meat or poultry product packages in an open (i.e., clear) overwrap do not have to include a net weight statement.", "See: 9 CFR 317.2(h), and 9 CFR 381.121(b) MPI Bulletin 211 NET WEIGHT STATEMENTS ON PACKAGES WITH HEADER LABELS: The guidelines for determining the size and location of net weight statements on meat food product packages with header labels are as follows: 1. The entire front of the package is considered the principal display panel of the package and its area is used to determine the size of the net weight statement. Print size specifications for the net weight statement specified by the regulations must be followed. 2. The net weight statement should be placed within the lower 30 percent area of the header label if no other mandatory labeling features are printed on the rest of the principal display panel of the package. If mandatory features do appear below the header label, the net weight statement must be placed within the lower 30 percent of the total area containing any mandatory information. A \u201cHeader Label\u201d is a small label applied across the top of a package usually bearing all of the mandatory labeling information. The rest of the package is most often a clear film containing a meat or poultry product, e.g., luncheon

meat. This type of packaging is designed to be used on pegboard type displays. See: Policy Memo 047 dated May 3, 1982 \u201cNEW\u201d AND SIMILAR TERMS: Terms like \u201cnew,\u201d \u201cnow,\u201d \u201cimproved,\u201d and similar terms may be used within the following guidelines: 1. The terms may only be used for a period of 6 months from the date of the initial approval, except as noted in 2., 3., and 4. below. 2. Extensions to the 6-month period may be granted if: a. Processors can demonstrate that production or distribution delays precluded the use of the approved labeling as scheduled. In such situations, the lost time can be restored. b. Processors can demonstrate that labeling inventory needs for the 6-month period were over estimated due to poor sales. The processors must maintain records which indicate the amount and the date the labeling was originally purchased. In this situation, up to an additional 6 months can be granted. No further extension will be considered.", "3. In those situations where it is customary to distribute \u201cnew\u201d products to various geographical regions, each geographic area may receive a sketch approval for 6 months if the processor can assure adequate controls over the segregation and distribution of the products. 4. In situations where it is customary to test market product in no more than approximately 15 percent of the intended total marketing area before total distribution begins, labeling for the test market area can receive a sketch approval and also be included in the 6-month sketch approval given to the labeling of the product distributed to the total marketing area. Processors must be able to assure that only 15 percent of the total market is involved in test marketing. See: Policy Memo 107 dated August 18, 1987 NEW ENGLAND BOILED DINNER: Product must contain at least 25 percent cooked \u201cCorned Beef.\u201d NEW ORLEANS STYLE: Acceptable for products that contain any five of the following ingredients: Roux base, rice, onion, green onions garlic, celery, bell peppers, cayenne pepper, white pepper, parsley, or tomato. The product may contain various protein sources including seafood and game. NITRITE: Calculations should be based on the total meat block including the muscle tissue, fat and blood (e.g., \u201cBlood Pudding\u201d). If the product is cured, the blood would be included and considered part of the meat. NON-AMENABLE PRODUCT\VOLUNTARY INSPECTION: [Examples of non-amenable products are sandwiches containing meat or poultry, clam chowder which has less than 1 percent bacon for export to Japan, and natural casings for export]. Any non-amenable product can be produced under voluntary inspection when requested (9 CFR 318.13 and Subchapter B, Part 350.3(c)). However, most FSIS requirements have to be met concerning labeling, i.e., mandatory labeling features, an accurate ingredients statement, handling statement, etc. Safe Handling Instructions are not required even for raw non-amenable products. FDA nutrition labeling rules apply to such products.", "NON-DAIRY WHITE SAUCE OR NON-DAIRY SAUCE: A sauce made with a non-dairy creamer. If this type of a sauce is proposed for use with \u201cChipped Beef,\u201d a suitable name would be \u201cNon-Dairy White Sauce with Chipped Beef\u201d or \u201cNon-Dairy Sauce with Chipped Beef.\u201d The reference to \u201cCream\u201d or any of its derivations should not appear in the product name. NONSPECIFIC MEAT FOOD PRODUCTS: Red meat items of this type do not have specific requirements, i.e., they do not possess a standard of identity or composition. Consequently, these products shall be identified by one of two ways: (1) A descriptive name that identifies characterizing components and\or ingredients, or (2) a fanciful or coined name that is accompanied by an ingredients statement. The latter approach should be used when the use of a descriptive name is not practical, e.g., when the descriptive name would read like an

ingredients statement. When a fanciful name or coined name is used, the ingredients statement should appear contiguous to the product name on the principal display panel of an immediate container. NONSTANDARDIZED COOKED SAUSAGE PRODUCTS CONTAINING BOTH LIVESTOCK AND POULTRY INGREDIENTS: The labeling of nonstandardized cooked sausage products must comply with 9 CFR 319.180. Meat food products are those in which more than 50 percent of the livestock and poultry product portion consists of livestock ingredients. Such cooked sausage products which contain poultry ingredients at more than 15 percent of the total ingredients (excluding water) must have product names that indicate the species of livestock and kind(s) of poultry ingredients, e.g., \u201cBeef and Turkey Frankfurter\u201d or \u201cFrankfurter Made From Beef and Turkey.\u201d Poultry food products are those in which more than 50 percent of the livestock and poultry products portion consists of poultry. Livestock ingredients at more than 20 percent of the total poultry and livestock ingredients must have product names that indicate the kind(s) of poultry and species of livestock ingredients, e.g., \u201cTurkey and Beef Frankfurter\u201d or \u201cFrankfurter Made From Turkey and Beef.\u201d Such cooked sausage products which contain livestock ingredients at 20 percent or less of the total poultry and livestock ingredients must have product names that are appropriately qualified to indicate the inclusion of livestock ingredients, e.g., \u201cTurkey Frankfurter -Pork Added or Turkey Frankfurter -With Pork. \u201d (The product names of cooked sausage products which contain no livestock ingredients designate the kind(s) of poultry ingredients, e.g., \u201cTurkey Frankfurter.\u201d) Cooked sausage products containing over 50 percent meat ingredients would carry the red meat legend while those containing over 50 percent poultry ingredients would carry the poultry legend.", "See: Policy Memo 087A regarding word size in the labeling of product names. See: Policy Memo 005A dated November 25, 1987

NOODLE CHICKEN VEGETABLE DINNER OR NOODLE CHICKEN DINNER WITH VEGETABLES: (Canned or in glass jars). Product must contain at least 6 percent cooked chicken. NUGGET LABELING: Nuggets are irregularly shaped, usually bite-sized meat and\or poultry products which are usually breaded and deep fat fried and intended to be used as finger foods. There are a number of different types of nuggets, the labeling for which is: (1) Products made from a solid piece of meat or poultry may use the term \u201cNugget\u201d as part of the product name without further qualification (e.g., \u201cChicken Nugget,\u201d \u201cBeef Nugget\u201d). (2) Products made from chopped and formed meat or poultry may use the term \u201cNugget\u201d as part of the product name, provided a qualifying statement describing such process is shown contiguous to the product name (e.g., \u201cChicken Nugget, Chopped and Formed\u201d or \u201cBeef Nugget, Chopped and Formed\u201d). (3) Products made from chopped meat or poultry and containing binders, extenders and\or water may use the term \u201cNugget\u201d as a fanciful name, provided a descriptive name immediately follows \u201cSpecies\u201d or \u201cKind\u201d nugget (e.g., \u201cBreaded Nugget-Shaped Chicken Patties\u201d). (4) Products described in (1), (2), and (3) above which are breaded shall be labeled as \u201cbreaded\u201d and shall be limited to 30 percent breading. See: Policy Memo 088 dated May 23, 1985 OAT FIBER: \u201cOat fiber,\u201d should be identified in the ingredients statement as \u201cisolated oat product.\u201d It may be used in non-standardized products and in products, such as, \u201ctaco fillings.\u201d OLEOMARGARINE: The Establishment Number may be omitted from the outer container, provided that articles are completely labeled including Establishment Number inside. See: 9 CFR

317.2(i)", "OMELET, DENVER OR WESTERN STYLE: Product must contain at least 18 percent ham with onions and green and\or red peppers. OMELET, FLORENTINE: Product must contain at least 9 percent cooked meat and must contain spinach. OMELETS WITH: Bacon -must contain at least 9 percent cooked bacon Chicken Livers -must contain at least 12 percent cooked liver Corned Beef Hash -must contain at least 25 percent corned beef hash Creamed Beef -must contain at least 25 percent creamed beef Ham -must contain at least 18 percent cooked ham Sausage -must contain at least 12 percent dry sausage Sausage and Cheese, (omelet with pepperoni, cheese and sauce) -must contain at least 9 percent sausage in the total product. OPEN DATING: Labels showing further qualifying phrases in addition to the explanatory phrase must submit with the application sufficient documentation to support these additional claims. See (9 CFR 317.8(b)(32) and 9 CFR 381.129(c).) Some local authorities require that packaged foods heated and sold hot from industrial catering vehicles be dated with the day the foods were placed in the warming units (e.g., Tuesday, Friday, etc.). When assured by the local authorities that the foods are under a rigid local inspection program, the designations may be approved without an explanatory statement as required by the regulations. To date, only the county of Los Angeles, California, has provided this assurance. The packing date should be shown on immediate or shipping containers of poultry food products as required by regulations (9 CFR 381.126 and 381.129(c)). When meat or poultry products are packed and held in freezer storage for later repacking, the explanatory phrase on repacked product should be in terms of \u201csell by\u201d or \u201cuze before.\u201d However, if a \u201cpacked on\u201d phrase is desired, the date shown shall be that of the original packing of the product.", "OSTRICH AND OTHER RATITES (EMU): Products that do not contain 3 percent of beef, pork, chicken or turkey, can not contain cure ingredients, i.e., Nitrite, nitrate. PAELLA CON BACALAO (SP): Product must contain at least 35 percent cooked meat or poultry meat and include seafood and no more than 25 percent cooked rice. The label must show true product name, e.g., \u201cBeef and Fish with Rice.\u201d PAPAIN: Meat and poultry products that are dipped in a solution containing papain are required to show in conjunction with the product name a statement, for example, \u201cTenderized with a solution of (list ingredients of solution).\u201d Carcasses of animals treated with papain by antemortem injection are required to be roller branded \u201cTenderized with Papain.\u201d Parts not so marked are required to be labeled as \u201cTenderized with Papain.\u201d See: 9 CFR 317.8(b) (25) 9 CFR 381.120 9 CFR 424.21 Enzymes-Proteolytic PAPRIKA: Generally, paprika and\or oleoresin of paprika are not permitted in or on fresh red meat products, fresh ground poultry, or fresh poultry sausage. They are permitted under the following conditions: 1. In both red meat and poultry products where such ingredients are acceptable and expected, including Italian Sausage, Salisica, Chorizo, Longaniza, and Hungarian Style products. All requests for additional products should be referred to the Labeling and Consumer Protection Staff to determine their acceptability. 2. On red meat products where their use does not misrepresent the leanness or freshness, e.g., application to a surface layer of fat and not to the muscle tissue. However, the name must be appropriately qualified, e.g., \u201ccoated with paprika\u201d or \u201cartificially colored.\u201d 3. In or on products where they are expected and the product name discloses this fact, or the product name refers to a component expected to contain the ingredients. Examples include: \u201cBeef with Barbecue Sauce,\u201d \u201cBeef -Barbecue Flavor,\u201d \u201cChicken Paprikash,\u201d \u201cChicken with Orange Sauce,\u201d or

similar type products.", "4. In fresh whole muscle poultry products, provided their presence is properly described, e.g., \u201ccoated with paprika,\u201d or \u201cartificially colored,\u201d as appropriate. PARTIALLY COOKED: 1. Partially cooked bacon \u2013 acceptable nomenclature if shrink requirement for fully cooked bacon is not met must meet requirements for trichinae treatment. Cooking instructions are required. 2. Partially cooked poultry \u2013 unacceptable for cooked poultry products. PARTIALLY DEFATTED (BEEF OR PORK) FATTY TISSUE: These are byproducts produced from fatty trimmings containing less than 12 percent lean meat. These ingredients may be used in meat products in which byproducts are acceptable. Products include nonspecific loaves, beef patties, frankfurters with byproducts, bologna with variety meats, imitation sausage, potted meat food product, sauces, or gravies. May be used in excess of the amounts of meat necessary to satisfy the standard for only the products listed in the Policy Book. However, in this situation, the PDCB or PDCP must always be declared in the ingredients statement. See: 9 CFR 319.15(e) 9 CFR 319.29(a) PARTIALLY DEFATTED CHOPPED (Beef or Pork) (PDCB, PDCP): 1. Partially Defatted Chopped Beef is not permitted in hamburger, ground or chopped beef. The School Lunch Program requires that when PDCB is used in products like taco mix, which later may be used in preparing other products (e.g., tacos or patties), the PDCB or PDCP must always be declared in the ingredients statement on the labeling of the taco mix. All Beef or 100 percent Beef is acceptable as product name. 2. Partially Defatted Chopped may be used in excess of meat necessary to satisfy the standards on only the products listed in the Policy Book. However, in this situation, the PDCP must always be declared in the ingredients statement. See: MPI Manual 18.55 PARTIALLY DEFATTED COOKED (Beef or Pork) FATTY TISSUE: This product may be used as an ingredient in: Beef patties (cooked and uncooked), Potted meat food product, Sauces, Gravies, Imitation sausage, and Nonspecific loaves. No limit on quantity is made. It is believed to be self-limiting.", "THE AMOUNT AND LABELING OF PDCB AND PDCP IN FOOD PRODUCTS CLASS FOOD CATEGORY AMOUNT LABELING Beef or Pork, or both I Beef Patties No Limit Beef or Pork, or both Imitation Sausage No Limit Beef or Pork, or both Non Specific Loaf No Limit Beef or Pork, or both Potted Meat Food Product No Limit Beef or Pork, or both Patty Mix No Limit Always must be declared Beef for Roasting 12 percent of Meat Block II Chinese Egg roll and other Chinese Specialties Up to 12 percent of the Meat Block Beef or Pork Chopped Beef Steak Up to 12 percent of the Meat Block Beef or Pork Corned Beef Hash Up to 12 percent of the Meat Block Beef or Pork Fabricated Steaks Up to 12 percent of the Meat Block Beef or Pork Pepper Steak Up to 12 percent of the Meat Block Beef or Pork Salisbury Steak Up to 12 percent of the Meat Block Beef or Pork Luncheon Meat (nonspecific) Up to 25 percent of Meat Block Pizza Meat Topping Up to 25 percent of Meat Block Beef or Pork Pizza With Meat Up to 25 percent of Meat Block Beef or Pork Cooked Sausage (9 CFR 319.180 (b)) Up to 15 percent of Meat Block Always must be declared Pepperoni Up to 15 percent of Meat Block Must be declared III Chili Up to 25 percent of Meat Block or larger As beef; or pork, if larger must be declared Meat Loaf Up to 25 percent of Meat Block or larger As beef; or pork, if larger must be declared Meat Balls Up to 25 percent of Meat Block or larger As beef; or pork, if larger must be declared Meat Fillings for Tacos, Burritos, Enchiladas, Tamales and other Mexican Foods Up to 25 percent of Meat Block or larger As beef; or pork, if larger must be declared IV Corned Beef Hash Up to 12 percent of Total Product Formulation Beef", "Note: All percentages as calculated on the basis of the fresh weight of meat content. PARTIALLY HYDROLYZED WHEY PROTEIN: An acceptable ingredient name for a binder. PASTELLES (SP): Product must contain at

least 10 percent fresh meat. Product is always made with pork in Puerto Rico. The label must show the true product name, e.g., \u201cPork Pastelles.\u201d PASTELLILLOS (SP): Puerto Rican Style product containing at least 8 percent cooked meat. Species is part of the product name. The label must show the true product name, e.g., \u201cPork Pastellilos.\u201d PASTITSIO: (Greek for casserole). Product must contain at least 25 percent fresh meat or 18 percent cooked meat. A product containing macaroni, ground beef, tomato paste, wine, white sauce, and Parmesan cheese that may be labeled \u201cGreek Style Pastitsio.\u201d PASTRAMI: Cooked cured beef with spices, generally made from the plate but other cuts can be used. The product must be smoked or treated with smoke flavoring. \u201cPastrami, Water Added\u201d is not permitted, although similar products labeled according to Policy Memo 084A are permitted. The term \u201cUnsmoked Cooked Pastrami\u201d must be used when the product is not smoked or does not contain smoke flavoring. Pastrami may or may not be coated with spices. When product is coated, a qualifier is not required. PASTRAMI JERKY: Acceptable name for product processed as pastrami prior to meeting the requirements for jerk. PASTRAMI, TURKEY: A cured turkey product that is cooked. The product must be smoked or treated with smoke flavoring. The term \u201cUnsmoked Cooked Turkey Pastrami\u201d must be used when the product is not smoked or does not contain smoke flavoring. Cured turkey thigh meat is an acceptable name.", "PASTY (CORNISH STYLE): Product must contain at least 25 percent beef. Product consists of a round or square of piecrust with a filling of chopped beef, potatoes, and onions. PATE DE FOIE: Product must contain at least 30 percent liver. Pate means paste; foie means liver. See: Foile Gras Products PATTIE FOLDOVER MIT DRESSING: Product must contain at least 50 percent pattie. PATTIES: Chopped and shaped and similar terms not required on products labeled patties. 1. Paprika not permitted in fresh meat patties. 2. PDCB or PDCP may be listed as beef or pork, except in patties with mechanically separated (species) product and school lunch labeled products. 3. PDBFT and PDPFT permitted. Must show as such in the ingredients statement. 4. Meat patties, with added fat up to 20 percent of the meat block, from a source other than that shown in the name, show as added (ex., Veal Patties, Beef Fat Added): over 20 percent to be part of the product name, e.g., \u201cVeal and Beef Fat Patties.\u201d 5. Ground beef patties -no extenders or water added. Hamburger patties -no extenders or water added. Same requirement as hamburger. 6. Pre-broiled beef patties with simulated stripes (patties are deposited on conveyor and pre-broiled). Parallel stripes are applied with a solution of caramel coloring and water through parallel spigots. Product name will identify artificial color marks on the label. 7. Antioxidants are permitted in pork or beef patties both raw and cooked. 8. Beef Patties: If beef byproducts are added which are not permitted by the standard, the list of ingredients must immediately follow the product name. See: 9 CFR 319.15(c) 9. Pork Patties: The standard for beef patties 9 CFR 319.15(c) shall be applied with the exception that the species is pork.", "PAUPIETTE (FR): Thinly sliced pieces of meat stuffed and rolled. Same standard as \u201cBeef Roulade,\u201d which is at least 50 percent cooked meat. PEANUT FLOUR: Can only be used in nonspecific products that are not subject to moisture controls. PECTIN: Can be used at a maximum use level of 3 percent in nonstandardized meat and poultry food products. The common and usual name of the ingredient, regardless of its source, is \u201cpectin\u201d (21 CFR 184.1588). PEPPER: The term \u201cpepper\u201d: as used in the Italian sausage regulation refers to the pungent spices, such as: black, white, cayenne, or red pepper. \u201cPaprika\u201d as an optional

ingredient is less pungent and is used primarily for its coloring qualities. Bell peppers, chilies, paprika and cayenne or red pepper, are from the capsicum pepper family. These products have specific uses and are recognized by specific names. \u201cPaprika\u201d should not be substituted for \u201cpepper\u201d in a meat or poultry food product.

**PEPPERONI:** A dry sausage prepared from pork or pork and beef. Combinations containing more than 55 percent beef are called beef and pork pepperoni. Pepperoni made with beef must be called beef pepperoni. Pepperoni must be treated for destruction of possible live trichinae and must have an MPR of 1.6:1 or less. Antioxidants are permitted in pepperoni. The casing, before stuffing, or the finished product, may be dipped in a potassium sorbate solution to retard mold growth. Extenders and binders are not permitted in pepperoni. Hearts, tongues, and other byproducts are not acceptable ingredients.

**PEPPERONI, COOKED:** Cooked pepperoni is not an acceptable product name.

**PEPPERONI WITH POULTRY:** Poultry may be added to pepperoni if properly labeled. If the meat block contains 20 percent or less poultry, the product is labeled \u201cPepperoni with Turkey (kind) Added.\u201d When poultry over 20 percent of the meat and poultry block product is labeled \u201cPork and Turkey (kind) Pepperoni,\u201d an MPR of 1.6:1 is applied. If the amount of poultry exceeds that of the meat, the product label reads \u201cTurkey and Pork Pepperoni.\u201d This would carry a poultry legend."

**"PEPPERS AND COOKED SAUSAGE IN SAUCE:** Product must contain at least 20 percent cooked sausage in total formulation.

**PERISHABLE UNCURED MEAT AND POULTRY PRODUCTS IN HERMETICALLY SEALED CONTAINERS:** Establishments seeking approval of label applications for perishable, uncured products which have received a less rigorous heat treatment than traditionally canned product (9 CFR 318 and 381, SUBPARTS G and X, respectively) must submit a sufficiently detailed processing procedure either incorporated on or attached to the FSIS Form 7234-1, APPLICATION FOR APPROVALS OF LABELS, MARKING OR DEVICE. The procedure must include a description of product formulation, method(s) of preparation, cooking and cooling temperatures, type of container, and cooking and handling instructions. Hermetically sealed containers include glass jars, metal cans, flexible retortable pouches, plastic semi-rigid containers, etc., that are airtight and\or impervious after filling and sealing. The policy does not apply to raw meat or poultry, cooked or roast beef, cooked poultry rolls and similar products, whole or uncut cured products, or products that are distributed and marketed frozen. However, products containing cured meat or poultry as components in combination with raw vegetables, e.g., pasta salads and other chilled meat\poultry meals or entrees containing raw or partially cooked vegetables, are covered under this policy, provided the above-mentioned procedural attributes are indicative of the manufacturing process. In addition, an approved partial quality control program (PQCP) is required which must address the critical points in the manufacturing process. As such, the PQCP must contain a detailed description of: ingredient storage controls, product formulation and preparation, container filling and sealing, any heat treatment (times\temperatures) applied, including a description of the equipment used, any other treatments applied, cooling procedures (times\temperatures), lot identification procedures; finished product storage conditions, in plant quality control procedures, and records maintenance procedures. The PQCP must be forwarded to the Processed Products Inspection Division (PPID) for appropriate review and approval before the product label may be used. Guidelines for development of PQCP's for these products may be obtained from PPID upon request. See: Policy Memo 110 dated December 8, 1987

**PET FOOD:** 1. Certified pet food

is manufactured under fee-for-service inspection in a facility approved for the manufacture of animal food. Labeling regulations for certified animal food specify that approval is granted by the labeling staff. However, final approvals are not granted since LCPS no longer grants final approvals. Rather, the company should keep a copy of the final label attached to the sketch approval." "2. Most food for animal consumption produced in a Federal facility is non-certified. It is not an inspected product; therefore, it is inedible product and does not bear any mark of inspection. The product has to be conspicuously labeled to distinguish it from human food. Additionally, the labeling must be in conformance with 21 CFR Part 501, Animal Food Labeling since animal food labeling is also under the jurisdiction of the Food and Drug Administration.

PFEFFERWURST (GR): Product should conform to sausage standard and contain whole peppercorn. Pork livers, pork stock, and beef blood are not acceptable ingredients.

PHOSPHATED TRIMMINGS IN LOAVES: Trimmings from preparation of pork cuts, cured with approved phosphates besides other curing ingredients, may be used without limitation in loaves other than meat loaves. When such trimmings are used, phosphates may be listed in the ingredients statement using the term \u201csodium phosphates\u201d or other applicable generic terms. PHOSPHATES IN DIPPING SOLUTIONS CONTAINING PROTEOLYTIC ENZYMES:

Phosphates have been approved for use as buffering agents in dry mixtures intended for solutions containing proteolytic enzymes. The phosphates should not exceed 0.1 percent of the \u201ctenderizing\u201d solution if they are to be considered incidental additives.

PICADILLO (SP): Product must contain at least 35 percent cooked meat. A Mexican style hash usually made with beef, garlic, onions, vinegar, and raisins. The species should be in the product name, e.g., \u201cBeef Picadillo.\u201d PICKLED PRODUCTS, DRY PACKED: Products that are pickled and dry packed should be qualified with the name of the pickle as part of the product name, e.g., \u201cKnockwurst Pickled with Vinegar,\u201d or \u201cKnockwurst Pickled.\u201d The weight of the package shall be the weight of the product less the weight of the pickle that will weep out of the product.

PIE FILLING: Product must contain at least 37 percent meat. Poultry pie filling must contain at least 18.75 percent cooked poultry meat. PIES: Product must contain at least 25 percent meat. Meat in the gravy may be counted. Poultry pies require at least 14 percent cooked poultry meat." "PIES, ENGLISH STYLE-AUSTRALIAN STYLE: Product must contain at least 25 percent meat or meat byproduct. Contains gravy and no vegetables with a puff pastry top.

PIMENTO (SP): Refers to allspice, but must be specifically named. It is also known as Jamaica pepper. PIMENTO SAUSAGE: Pimientos permitted when declared in product name as \u201cPimiento Sausage.\u201d See: Policy Memo 120 dated August 1, 1990

PINKELWURST (GR): A cooked product that is stuffed in a casing with a diameter of from 1 1/2 to 2 inches and a length of about 10 to 12 inches. It is formulated with beef fat, pork fat, onions, oat groats, water, and sufficient spice to satisfy seasoning requirements.

PIROSHKI OR PIROGI: Product must contain at least 10 percent cooked meat. A Russian or Jewish dish made of thin rolled dough or pastry that is filled and either steamed, baked, or fried. They resemble small turnovers, pockets, or raviolis.

PIZZA: Products identified as \u201cpizzas\u201d that contain a meat or poultry component as part of the product name are no longer required to contain a minimum amount of meat or poultry provided that the meat component is sufficient to make the product subject to USDA jurisdiction. An antioxidant used in pepperoni or sausage need only be reflected in the ingredients statement. See: 9 CFR 317.8(b)(40) and 9 CFR 381.129(f)

PIZZA BURGER: Product meets the burger standard, e.g., hamburger or ground beef patty. It

can be two patties with cheese (usually Romano) and\or tomato or pizza sauce between the patties. PIZZA, CHICAGO STYLE: Acceptable labeling for a product which has been manufactured by first placing the cheese on the crust, then following with the meat and then the sauce. Condimental quantities of a grated cheese may then be placed on the top. The product usually has the deep dish characteristics.", "PIZZA CONTAINING CHEESE SUBSTITUTES: The labels for products containing cheese in a ratio less than one part cheese to nine parts cheese substitute, need to include additional qualifying information. Example: Pizza Sausage, cheese substitute and cheese; Combination Pizza -Sausage -Pepperoni Imitation Cheese and Cheese. See: Policy Memo 01 dated May 6, 1980 PIZZA DOGS: A nonspecific product. PIZZA, PAN STYLE: Pizza that is marketed in a pan and contains a thick crust. PIZZA PUPS: Product has two crusts, filled with a mixture of pork, tomato puree, and condimental substances. The finished article is approximately 8 inches in length, 2 1\2 inches wide with a thickness of 3\4 inches. It is a type of pizza. The label must show a true product name, e.g., \u201cPork and Sauce Filling in A Crust.\u201d PIZZA ROLL: This is a nonspecific meat food product. When the name appears on a label, there must be a contiguous statement identifying the major components of the product or a complete ingredient listing. There are two major types of pizza rolls. One is a cooked sausage-like meat food product that contains cheese, usually contains peppers and has no water limitation. The second type consists of a roll-shaped dough enclosure with various fillings. A manufacturer of the latter type of product has asserted trademark protection of the term \u201cpizza roll.\u201d PIZZA SAUCE WITH SAUSAGE: Product contains at least 6 percent sausage. PIZZA SAUSAGE: Not an acceptable name. Product must be labeled \u201cSausage for Pizza.\u201d PIZZA, SICILIAN STYLE: A thick crust pizza. The crust is usually 50 percent or greater of the total pizza product.", "PIZZA TOPPING CONTAINING SAUSAGE: The sausage portion of cooked pizza topping contains up to 10 percent water and 3.5 percent binders (9 CFR 319.140). The formulation must indicate the sausage portion of the pizza topping. However, the ingredients statement of the cooked pizza topping does not have to list \u201csausage\u201d in its sublisting. There are no restrictions on the amount of seasonings in the sausage portion. 1. Pizza topping must be cooked. 2. In the sausage portion: a. Water \u2264 (less than or equal to) 10 percent of the sausage portion b. Binders including TVP \u2264 (less than or equal to) 3.5 percent of the sausage portion c. Seasonings are unlimited 3. The ingredients statement of the pizza topping can be arranged in different ways: a. Composite e.g., cooked pizza topping [pork, water, TVP (\u2026), Seasonings (\u2026)] b. Component, e.g., cooked pizza topping [sausage (pork, water, seasonings (\u2026), TVP (\u2026), water (\u2026)] These parameters do not apply when specific sausage products are subject to other regulations, e.g., Italian Sausage. In these situations, the specific regulation (i.e., Italian Sausage) provides the requirements, such as, the amount of water and binders are permitted. PIZZA TOPPING MIX: A nonspecific product, which includes products with names that indicate the type of meat or poultry in the product (e.g., Chicken and Pork Pizza Topping or Beef Pizza Topping). Antioxidants are permitted, see 9 CFR 424.21. Water, extenders, and binders are acceptable. PIZZA, WORD SIZE: When a pizza has a true product name, e.g., \u201cCombination Sausage and Pepperoni Pizza,\u201d the true product name must be prominent, conspicuous, and legible, with all words at least one-third the size of the largest letter in any word of the product name. If on the label the manufacturer also elects to display elsewhere the word \u201cPizza\u201d in exaggerated fashion, the word \u201cPizza\u201d is not considered in the determination of the size of the letters within the

true product name. See: Policy Memo 087A dated September 16, 1985", "PFF (PROTEIN FAT FREE) ADJUSTING FOR USE: Protein Fat Free (PFF) controlled cured pork products with qualifying statements, e.g., \u201cHam-Water Added,\u201d may be used in place of PFF controlled cured pork products without qualifying statements, e.g., Ham, to meet the minimum meat requirements of various products. However, the amounts of the PFF controlled cured pork products with qualifying statements used will need to be increased. For example, if a standard requires a certain amount of Ham and a processor wishes to use \u201cHam-Water Added,\u201d a greater amount of the \u201cHam-Water Added\u201d will be needed to meet the standard. The magnitude of the additional amount is directly related to the relationship between the respective PFF values. See: Policy Memo 093 dated December 16, 1985 Example: Ham Salad requires 35 percent Cooked Ham. \u201cHam Water Added\u201d will be used in the product formula. Calculation: Multiply the PFF value for Ham (20.5) by the amount of required Ham (35 percent). Divide this answer by the PFF value of the product being used to formulate the product. (In this example, PFF value for \u201cHam-Water Added\u201d is 17.0.) Answer: [(0.35 x 20.5) \u2225 17.0] x 100 = 42.21 percent \u201cHam-Water Added\u201d needed in the formula. Example: Ham Pie requires 25 percent Ham based on green weight. \u201cHam with Natural Juices\u201d will be used in the product formula. Calculation: Multiply the PFF value for Ham (20.5) by the amount of required ham (25 percent). Divide this answer by the PFF value of the product being used to formulate the product. (In this example, PFF value for \u201cHam with Natural Juices\u201d is 18.5.) Answer: [(0.25 x 20.5) \u2225 18.5] x 100 = 27.70 percent \u201cHam with Natural Juices\u201d needed in the formula.

ADJUSTING FOR \u201cHAM AND WATER PRODUCT X percent OF THE WEIGHT IS ADDED INGREDIENTS.\u201d Consider a formulated product which is required to contain at least 50 percent Cooked Ham. If the processor chooses to use a \u201cHam and Water Product (HWP)\u201d in which 20 percent of the weight is added ingredients as the source of the Ham in the formulation, this product contains 80 percent Ham and 20 percent added ingredients. Clearly, the processor must use more than 50 percent HWP in the process. Using 50 percent HWP would result in only 40 percent Ham in the finished product, i.e., the added ingredients in the HWP represents 25 percent of the ham content. (If it were a 10 lb. HWP, there would be 8 lbs. of Ham and 2 lbs. of added ingredients.  $(2 \u2225 8 \times 100 = 25$  percent). Consequently, an additional 25 percent of HWP is required in the formulation. The following example may be used to determine the percentage HWP needed to equal", "Ham: Ham and Gravy requires 50 percent Cooked Ham. \u201cHam and Water Product 20 percent of Weight is Added Ingredients\u201d will be used in the formulation. Step 1: Subtract the percent added ingredients from 100 percent. In this example:  $1.00 - 0.20 = 0.80$  Step 2: Determine the amount of Ham needed in the formula. (In this example: 50 percent) Step 3: Divide the amount of Ham required. Determined in Step 2) by the answer in Step 1 (In this example:  $(0.50 \u2225 0.80 = 0.625$ ) Step 4: Multiply the answer in Step 3 by 100. Answer for this example is 62.50 percent \u201cHam and 20 percent Water Product\u201d is needed as the equivalent of 50 percent Ham.

PLANTATION: The regulations and policies applicable to \u201cFarm\u201d also apply to plantation.

POINT OF PURCHASE MATERIALS: Point of purchase materials which refer to specific meat or poultry products are considered labeling under certain circumstances. When printed and\u2014or graphic informational materials (e.g., pamphlets, brochures, posters, etc.) accompany or are applied to products or any of their containers or wrappers at the point of purchase, such materials and the claims that

they bear are deemed labeling and they are subject to the provisions of the Federal Meat Inspection Act and the Poultry Products Inspection Act. Although the Food Labeling Division (FLD) does not exercise its authority to subject point of purchase materials to specific prior approval (materials shipped with the products from the federally inspected establishment are an exception), we do expect point of purchase materials to be in accordance with the Federal regulations and all current labeling policies. Upon request, FLD will review and comment on the point of purchase materials submitted to our office. During the review process, promotional materials will be scrutinized for special claims, particularly those related to nutrition, diet, and animal husbandry practices. Claims related to nutrition and diet must be made in accordance with all current nutrition labeling regulations. Continuing compliance with stated claims will be assured through periodic sampling, as necessary. Claims are expected to be within the compliance parameters identified in the nutrition labeling regulations. Animal husbandry claims (e.g., the nonuse of antibiotics or growth stimulants) may be made only for products shipped in containers or wrappers labeled with the same animal production claims. See: Policy Memo 114A dated August 18, 1994", "POLISH SAUSAGE: A sausage that is cured, cooked, and usually smoked. Pork and pork byproducts shall comprise at least 50 percent of the meat and meat byproducts ingredients. To have beef as a predominant ingredient, the product name would be \u201cBeef and Pork Polish Sausage.\u201d Green peppers are permitted up to 4 percent in total formulation. An uncured (fresh), uncooked variety with no more than 3 percent water also exists. \u201cFresh\u201d shall be used in the name when the product is uncured. When Fresh Polish Sausage is cooked or smoked, then the product name is either \u201cCooked Fresh Polish Sausage\u201d or \u201cSmoked Fresh Polish Sausage.\u201d The requirements of Policy Memo 110 apply when these perishable, cooked, uncured products are packaged in hermetically sealed containers. POLYNESIAN STYLE SAUSAGE: Product must contain fruit juices, a sweetening agent, and soy sauce. POLYSORBATE: Permitted in pickling solutions without declaration. PORK AND BACON SAUSAGE: Up to 50 percent bacon permitted provided: 1. bacon is brought back to green weight before use. 2. product is trichinae treated. 3. product name is \u201cPork and Bacon Sausage.\u201d The standard for \u201cPork Sausage and\u201d with Bacon\u201d is 10 to 20 percent bacon, and for \u201cPork and Bacon Sausage\u201d is more than 20 percent but not more than 50 percent bacon. PORK AND DRESSING: Product must contain at least 50 percent cooked pork. PORK AND DRESSING WITH GRAVY: Product must contain at least 30 percent pork. PORK CRACKLINGS: Product eligible to be labeled as \u201cPork Cracklings\u201d must be prepared from fatty tissues from which the skin has been detached. If the skin is not removed from the product before rendering, a descriptive name, e.g., \u201cPork Cracklings, Fried-Out Pork Fat with Attached Skin,\u201d must be used.", "PORK FAT: Pork fat shall be declared as such in the ingredients statement. Clear fatbacks and clear shoulder plates must be declared as \u201cPork Fat.\u201d Pork fat may be declared as pork in the ingredients statement if it contains visible lean and it is used in a standardized product which has a fat limitation. PORK JOWLS: Product may be declared as pork if skinned. See: Pork Skins PORK SAUSAGE: Product identified as pork sausage does not include the use of pork cheeks. When such an item is offered as \u201cWhole Hog,\u201d tongues, hearts, and cheeks may be used in the natural proportion as found in the hog carcass. \u201cFresh\u201d shall be used in the name when the product is not cured, cooked and\u201d or smoked. PORK SKIN RESIDUE AFTER GELATIN EXTRACTION: This material consists of back fat

skins from which the gelatin has been extracted by means of soaking the skin in acid and subsequent low temperature cooking for the extraction of gelatin. It is not permitted in sausage but may be used in imitation sausage, potted meat food product, loaves (other than meat loaves), and other nonspecific products. PORK SKINS: Not permitted in salami, bologna, frankfurters, Vienna sausage, and braunschweiger. When packed in vinegar pickle, they are not permitted to be artificially colored. When pork skin, either attached to fat and\or muscle tissue or detached from fat and\or muscle tissue, is used to manufacture meat or poultry products, it must be specifically listed in the formulation on the label approval application form and in the ingredients statement on the label, e.g., \u201cPork Skins,\u201d Unskinned Pork Jowls,\u201d \u201cUnskinned Pork Shoulder Trimming,\u201d \u201cUnskinned Pork Fat,\u201d and \u201cUnskinned Pork Bellies.\u201d \u201cDetached skin\u201d refers to the portion of skin from which most of the underlying fat is removed, e.g., skin from bacon intended for slicing, skin from closely skinned hams, shoulder cuts, fat backs, etc. If removal of skin portions is incidental to removal of a considerable proportion of underlying fat from ham, shoulder, back, etc., preparatory to rendering such fat, portions of skin so removed should not be regarded as detached skin and may be included with fats and rendered into lard. Ham facings are not regarded as detached skin.", "PORK SKINS, FRIED: When prepared from the skin of smoked pork bellies, it may be labeled as \u201cFried Bacon Skins,\u201d \u201cFried Bacon Rinds,\u201d or \u201cFried Pork Skins.\u201d The kind of skin used must be stated on the labeling records when submitted for label approvals. PORK SPARE RIBS, CENTER CUT: Center cut pork spare ribs refers to pork spare ribs with the loin portion, the brisket (brisket must be removed at a point which is dorsal to the curvature of the costal cartilages), the tail and two ribs from the shoulder removed, this remaining center section may be further portioned or left in one piece. PORK SPARERIBS, ST. LOUIS STYLE: St. Louis Style Spare Ribs are the same as \u201cPork Spareribs\u201d except that the sternum and the ventral portion of the costal cartilages are removed with the flank portion. This cut is made at a point in which the sternum and costal cartilages are removed dorsal to the curvature of the costal cartilages. If specified by the purchaser, the diaphragm shall be removed. This anatomical description of the cut must be provided with the information for label approval. POTATO SAUSAGE, SWEDISH STYLE, OR POTATO RING OR POTATO PUDDING: Labels for sausages and pudding identified as \u201cPotato Sausage,\u201d \u201cPotato Brand Sausage,\u201d \u201cPotato Ring,\u201d and \u201cSwedish Style Potato Sausage\u201d may be approved under the following guidelines: 1. The product must contain a minimum of 45 percent meat and no byproducts. 2. Water must be limited to 3 percent at formulation. 3. When extenders or binders are used, they must be limited to 3.5 percent or 2 percent in accordance with 9 CFR 424.21 of the finished product. 4. The product must include a minimum of 18 percent potatoes. Sausage identified as \u201cSwedish Style Potato Sausage\u201d is provided for under the following guidelines: 1. The product must contain a minimum of 65 percent meat and no byproducts 2. Water must be limited to 3 percent at formulation. 3. No extenders or binders are permitted. 4. The product must include a minimum of 18 percent potatoes. Meat food product identified as \u201cPotato Pudding\u201d is provided for under the following guidelines: ", "1. The product must contain a minimum of 18 percent potatoes. 2. The product does not meet the other requirements for products identified as \u201cPotato Sausage,\u201d \u201cPotato Ring,\u201d or \u201cSwedish Style Potato Sausage.\u201d See: Policy Memo 011 dated September 8, 1980 POULTRY: Cuts of poultry that are not identified in 9 CFR 381.168, Table V, may use the maximum amount of

poultry skin permitted for that \u201ckind.\u201d For example, \u201cturkey\u201d is listed in the table and may contain up to 15 percent skin. Therefore, a product identified as \u201cwhite turkey\u201d can be placed in this category for a maximum of 15 percent skin.

**POULTRY, ASSORTED PIECES:** The product name \u201cPoultry (Kind) Assorted Pieces\u201d is acceptable and does not require the product to be in natural proportions. In addition, the term \u201cpiece\u201d is not the same as the term \u201cpart,\u201d i.e., a piece does not have to be a whole part, e.g., a breast, thigh, or drumstick.

**POULTRY BACON:** See: Bacon-Like Products

**POULTRY BREASTS:** When poultry breasts with ribs are boned and the resulting product contains portions of the scapula (shoulder) muscles and/or muscle overlying the vertebral ribs, they must be labeled to indicate that fact. Proper names for such products are \u201cBoneless Breast with Rib Meat,\u201d White Chicken Meat or White Turkey Meat,\u201d or if the skin is left intact, \u201cWhite Boneless Chicken or White Boneless Turkey.\u201d Product labeled \u201cBoneless Breast\u201d without further qualification may not contain scapula or rib meat.

**POULTRY FRANKFURTERS (SIMILAR COOKED SAUSAGES):** Products which contain pork fat must be labeled with pork fat added in the product name.

**POULTRY GRADING: (LABELING)** Indicates the quality grades of poultry (U.S. grade A, B, or C). The shield design contains the letters \u201cUSDA,\u201d the U.S. grade of the product, and if not shown elsewhere, the class of poultry. Any letter grade on a consumer package or individual carcass indicates the product was graded by a licensed grader of the Federal or Federal-State grading service, and may not be applied otherwise. Letter grades on bulk packaging or shipping containers only indicate that the product is equal to that particular U.S. Grade." , "A. **APPLYING GRADEMARKS TO SHIPPING CONTAINERS** All poultry classes and kinds listed in 9 CFR 381.170, except necks, giblets, detached tails, wing tips, skin and stripped backs (below Grade C) are eligible for grading. In addition, the following poultry parts may be officially graded: Boneless, Skinless Breast and Thigh Tenderloin or Boneless Breast without Tenderloin Boneless Breast Quarters Breast Quarters with Bone in Boneless Thigh Halves Wing Portion or Section Breast Halves Broiler Turkey or Duck Halves Split Breast Split Fryers Skinless, bone-in Thighs, Drums and Breasts Boneless Breast, Thigh Bone-in products marinated in a colorless solution Poultry cuts other than those identified above may not be eligible for grading; therefore, particular attention should be given to the product name when approving labels for various poultry products which include grade marks (for example, \u201cThin Breast Fillets, Thigh Strips\u201d). Grade marks on raw poultry parts processed with solutions that may impart color (for example, injected with a 5% solution of water, salt, butter) or cooked poultry products are required to include a statement, for example, \u201cPrepared from Grade A Poultry.\u201d The USDA grader in the plant makes the final determination concerning the necessity of the \u201cPrepared from\u201d statement in situations where it is not apparent at the time of label approval that the added solutions have the ability to impart color to the finished poultry product.

Products which may not be grade marked: Detached Necks Giblets Packed Separately Detached Tails Wings Tips Stripped Backs Below C Quality Diced or Shredded Meat B.

**WING DESCRIPTION** The wing is made up of three sections. The section attached to the carcass is the first section. The wing tip is the third section.

**C. GRADING BACKS WITH NECKS** In applying grade standards, when necks are packed with backs following these steps:" , "1. When backs are graded as provided for in the standards, the name of the product is required to read as follows: a. Grade A Backs \u201cwith necks,\u201d or \u201cand necks.\u201d b. Grade B

Backs \u201cwith necks,\u201d or \u201cand necks.\u201d c. Grade C Backs \u201cwith necks,\u201d \u201cGraded backs and necks,\u201d or \u201cbacks and necks.\u201d 2. Necks are to be packed with backs in natural proportions. 3. Necks may or may not be attached to backs. Necks for all officially graded backs are to be free from serious discolorations, feathers, pin feathers, and accumulations of blood and\or excess water. 4. A neck, front, or hind portion of back, when removed from birds which meet the stated quality, may be used to achieve exact weights. Only one of these portions may be used per package. Scraps of backs or necks may not be used. 5. Labels for packages with portions are required to indicate which portions, for example, first (1st) portion, 2nd portion, 1st and 2nd portions, 2nd and 3rd portions, etc. D. PRESSURE SENSITIVE STICKERS AND TAPE: 1. Inserts or pressure sensitive stickers with the trademark are required to have plant number. 2. Trademarks on pressure sensitive tape should not be used on consumer packages. 3. Insert with the trademarks are not to be used inside opaque bags.

**POULTRY HINDQUARTERS:** The term \u201chindquarters\u201d on labels for single cut poultry items is an acceptable alternative to the recognized terminology \u201cLeg Quarter\u201d specified in the regulations. The use of the term \u201cHindquarters\u201d requires only a specified class of poultry to be considered a true product name, e.g., \u201cChicken Hindquarters.\u201d Either term refers to a poultry thigh and drumstick, with a portion of the back attached.",

**"POULTRY HINDSADDLES:** Poultry hindsaddles are connected poultry leg quarters (the rear of the bird). The product name \u201cPoultry Hindsaddles\u201d may be used alone on the product's label if the product is not intended for retail sale. In contrast, the name \u201cpoultry hindsaddles\u201d on the label of a product intended for retail sale must be accompanied by a fully descriptive name (e.g., \u201cPoultry Hindsaddles, Connected Leg Quarters\u201d).

**POULTRY MEAT, RAW:** The labeling of raw poultry meat obtained from other than young poultry includes the class designation, e.g., \u201cYearling Turkey Meat\u201d or \u201cMature Chicken Meat.\u201d

See: Policy Memo 032 dated September 4, 1981 See: 9 CFR 381.117(b)

**POULTRY PARTS:** Specific net weight packages for poultry parts, usually those containing legs or wings, include a single part, e.g., a drumstick or thigh, to make the stated weight. The name on the label must reflect this practice, e.g. \u201cChicken Legs -Chicken Thigh added to make weight.\u201d The single part must be cut at the joint. Wing tips are not permitted as added parts.

**POULTRY PRODUCTS:** In poultry products where \u201cmeat\u201d appears in the product name, e.g., \u201cWhite Meat Chicken Roll,\u201d and \u201cDark Meat Turkey Loaf,\u201d skin and attached fat are permitted in greater than natural proportions. However, the ingredients statement must have the poultry skin or poultry fat listed. When skin and attached fat appear in the ingredients statement, their placement should be in the correct order of predominance and determined by the amount present over the permitted natural proportions.

**POULTRY PRODUCTS CONTAINING MEAT INGREDIENTS-LABELING:** Poultry products containing meat in amounts that exceed 20 percent of the total meat and poultry product portion of the poultry product must be descriptively labeled to indicate the presence of the meat ingredients, e.g., \u201cChicken and Beef Stew or Stew made with Chicken and Beef\u201d. Poultry products containing meat ingredients in amounts at 20 percent or less of the total meat and poultry product portion of the poultry product must have names that are qualified to indicate the presence of the livestock ingredients, e.g., \u201cChicken Stew-Beef Added\u201d. However, poultry products that do not meet specified minimum poultry ingredient requirements because meat ingredients

are replacing any part of the required poultry", "ingredients must be descriptively labeled to indicate the presence of meat ingredients, e.g., \u201cTurkey and Pork Chop Suey\u201d. See: Policy Memo 029 dated September 4, 1981 POULTRY PRODUCTS WITH OTHER THAN NATURAL PROPORTIONS OF WHITE AND DARK POULTRY: Poultry products containing white and dark chicken or turkey of a distinguishable nature and in quantities other than natural proportions of white to dark meat must bear a qualifying statement identifying the types of poultry meat used in conjunction with the kind of poultry in the product name. The poultry block of white and \dark meat (excluding products labeled as \u201cMechanically Separated (Kind of Poultry)\u201d) solely determines the usage of the terms \u201cwhite and dark,\u201d \u201cdark and light,\u201d \u201cwhite,\u201d \u201cdark,\u201d etc. in the product name. Ground poultry (excluding the skin) that bears the terms \u201cwhite\light,\u201d \u201cdark,\u201d \u201cbreast,\u201d \u201cthigh,\u201d etc. in the product names is also considered as part of the poultry block for determining the usage of terms \u201cwhite and dark,\u201d \u201cdark and light,\u201d \u201cwhite,\u201d \u201cdark,\u201d etc.

However, products labeled as \u201cMechanically Separated (Kind)\u201d do not have any bearing on the use of terms \u201cwhite,\u201d \u201clight\u201d or \u201cdark\u201d in the product name since, \u201cMechanically Separated (Kind)\u201d is as indistinguishable paste-like product that is considered a separated standardized poultry food product ingredient. Additionally, products with mixture of distinguishable poultry (white or dark) and \u201cMechanically Separated (Kind)\u201d can not bear claims of \u201call white,\u201d \u201cpure breast,\u201d \u201c100 percent dark,\u201d or similar terms. In this situation, the poultry portion of the product contains at least two separated poultry ingredients, or one of which is \u201cMechanically Separated (Kind).\u201d See 9 CFR 381.117(c), Table 1 POULTRY PUFFS: Product must contain at least 15 percent cooked poultry meat. Chicken or Turkey Puffs are classified as hors d'oeuvres and must show a true product name, e.g., \u201cBreaded Chicken and Rice Balls.\u201d POULTRY, RAW WITH ADDED SOLUTION: Unless addressed by other regulations and policies, water and\or oil based solutions may be added to raw poultry and poultry parts at various levels. The product name must contain a descriptive designative in accordance with 9 CFR 381.117(h). POULTRY SALAMI PRODUCTS: Poultry sausages prepared to resemble salami and offered to consumers as a salami shall bear product names as follows: 1. \u201c(Kind) Salami\u201d shall be the product name when the moisture-to-protein ratio in the finished product does not exceed 1.9:1. This product resembles a dry salami made from red meats." 2. \u201cCooked (Kind) Salami\u201d shall be the product name when the product is cooked and the moisture-to-protein ratio is above 1.9:1. This product resembles \u201ccooked salami\u201d made from red meats. See: Policy Memo 006 dated July 30, 1980 POULTRY SAUSAGE: Sausage products made from poultry must be labeled to indicate kind, e.g., \u201c(Chicken) Sausage,\u201d \u201c(Turkey) Bologna,\u201d etc. Products containing more than one kind of poultry or red meat must declare the added ingredient in the product name, e.g., \u201cChicken Bologna, Beef Added\u201d and \u201cTurkey Franks, Chicken Hearts Added\u201d per Policy Memo 029 dated September 4, 1981. The basic sausage standards, per meat 9 CFR 319.140, also apply to poultry, except for added water and fat." POULTRY SKIN: When determining the amount of poultry skin allowed, refer to 9 CFR 381.168. If the specific part is not identified in this part, use the figure for boneless kind. POULTRY STANDARDS: Name Minimum or Maximum percentage Poultry a la King At least 20

percent poultry meat Poultry Barbecue At least 40 percent poultry meat Poultry, Breaded No more than 30 percent breading Poultry, Brunswick Stew At least 12 percent poultry meat Brunswick Stew with At least 8 percent poultry meat Poultry Poultry Burgers 100 percent meat with skin and fat in natural proportions Poultry Cacciatore At least 20 percent poultry meat or 40 percent with bone. Poultry Cannelloni At least 7 percent poultry meat Poultry Chili At least 28 percent poultry meat Poultry Chili with At least 17 percent poultry meat Beans Poultry Chop Suey At least 4 percent poultry meat Chop Suey with Poultry At least 2 percent poultry meat Poultry Creole with Rice At least 35 percent cooked poultry meat and sauce portion. Not more than 50 percent cooked rice in total product. Poultry Chow Mein At least 4 percent poultry meat (w/o noodles)", "Poultry Croquettes At least 25 percent poultry meat Poultry, Creamed At least 20 percent poultry meat Poultry Dinners At least 18 percent poultry meat Poultry Fricassee At least 20 percent poultry meat Poultry Fricassee At least 40 percent poultry wings with Wings (cooked basis with bone) Poultry Gizzards and At least 35 percent cooked Gravy gizzards Poultry Hash At least 30 percent poultry meat Poultry Liver Omelet At least 12 percent cooked poultry liver Poultry Meatloaf At least 65 percent raw poultry or 50 percent poultry meat and a Poultry Noodle Dinner At least 15 percent poultry meat. Poultry Noodle Dinner At least 6 percent poultry meat. with Gravy Poultry with Noodles At least 15 percent poultry meat or Dumplings or 30 percent poultry meat with bone. Noodles or Dumplings At least 6 percent poultry meat. with Poultry Poultry Paella At least 35 percent poultry meat or 35 percent poultry meat and other meat, no more than 35 percent cooked rice, must contain seafood. Poultry Parmigiana At least 40 percent breaded poultry See: Veal Parmigiana Poultry Pies At least 14 percent poultry meat Poultry Ravioli At least 2 percent poultry meat", "Poultry Salad Mix At least 45 percent poultry Poultry Salad At least 25 percent poultry See: Salad, Poultry Poultry Soup At least 2 percent poultry meat Poultry Flavored Soup No minimum requirement (less than 2 percent poultry meat) Poultry Spread At least 30 percent poultry Poultry Stew At least 12 percent poultry meat Poultry Stew with At least 8.4 percent poultry meat Dumplings (Based on 70 percent of Stew requirement). Poultry Subgum At least 12 percent poultry Poultry Tamales At least 6 percent poultry meat Poultry Tetrazzini At least 15 percent poultry meat Poultry Turnover At least 14 percent poultry meat Poultry with Gravy\ At least 35 percent poultry meat Sauce Gravy with Poultry At least 15 percent poultry meat Poultry with Gravy and At least 25 percent poultry meat Dressing Poultry with Rice At least 15 percent poultry meat Poultry Scrapple At least 30 percent poultry and/or poultry byproducts. Poultry with At least 15 percent poultry meat. Vegetables POULTRY TENDERS AND POULTRY TENDERLOINS: A \u201c(Kind) Tender\u201d is any strip of breast meat from the kind of poultry designated.", "A \u201c(Kind) Tenderloin\u201d is the inner pectoral muscle which lies alongside the sternum (breast bone) of the kind indicated. See: Policy Memo 100 dated September 3, 1986 POULTRY WING SECTIONS -(KIND): Wing Sections is an acceptable designation for a product consisting of equal proportions of the parts of a wing. It may be and is usually used for equal proportions of wing portions and drummettes. PREMIER JUS OR (OLEO STOCK): The product obtained by rendering at low heat the fresh fat of heart, caul, kidney, and mesentery collected at the time of slaughter of bovine animals. The raw material does not include cutting fats. Premier Jus is not an acceptable name unless accompanied by the term \u201cOleo Stock.\u201d PRESSURE SENSITIVE LABELS: Labels applied to packages shall be of the self-destructive type and must adhere to the packages under all conditions of use. PRESSURE SENSITIVE STICKERS AND

**INDELIBLE INK:** Pressure sensitive stickers are as a means for manufacturers to use existing labeling material by covering inaccurate and\or misleading labeling information with corrected text or used as a promotional tool, e.g., a starburst encircling sweepstakes terminology. A pressure sensitive sticker must be the type that destroys the underlying label or package if removed, or be self-destructive. Similarly, indelible ink is used as a means for manufacturers to use existing labeling material by covering inaccurate and\or misleading labeling information with opaque ink or adding required information with a rubber stamp. Temporary label approval is not required when the entire label including the pressure sensitive sticker or marking\covering from indelible ink is truthful, not misleading, and the product is not misbranded. Corrected text on pressure sensitive sticker can cover mandatory or non-mandatory information. Indelible ink may be used to cover inaccurate information or apply markings to existing labeling material in order to make the labeling accurate and truthful. Labeling bearing pressure sensitive stickers or marking\covering from indelible ink falls under the provisions of the generic label approval regulations in 9 CFR 317.5 and 9 CFR 381.133, which provides the conditions for use of final labeling without first submitting sketch labeling for evaluation and approval at headquarters. Companies need to create and maintain records of all final labeling, otherwise known as generic approvals.","Consistent with the rules on generic labeling approval, sketch labeling approval is required for the entire label when pressure sensitive stickers or marking from indelible ink contain special claims (e.g., quality, nutrient content, health, negative, geographical origin, animal production (e.g., \u201cno antibiotics administered,\u201d breed claims, and \u201cno hormones added\u201d), and other claims (e.g., \u201cnatural\u201d), guarantees, foreign language or a change of the nutrition facts serving size. For non-standardized amenable product labeling (e.g., descriptive name products, meat flavors or poultry reaction flavors, etc.) that received sketch approval and the existing labeling is modified by use of pressure sensitive stickers or indelible ink, a sketch approval is required when a change is made to the product label not covered by generic approval regulations 9 CFR 317.5(b) (9) and 381.133(b) (9), e.g., a product name change. Certain products are not compliant with the generic approval regulations, e.g., exotic animal product labeling, rabbit product labeling, certified pet food labeling, etc. In situations where existing labeling is modified by use of pressure sensitive stickers or indelible ink, the labels must be submitted to the Labeling Consumer Protection Staff in Washington, D.C for sketch approval. Transferred labels bearing a pressure sensitive sticker covering the existing legend or indelible ink covering the existing legend, are operating under the original establishment\u2019s final label approval record, even though the establishment number is for that of the producing establishment. When pressure sensitive stickers are used to cover and correct other existing information or indelible ink is used to cover or add information, the rules for sketch approval and generic labeling apply to the entire label. This entry cancels Policy Memo 115 dated July 11, 1988, since 115 is out of date.

**PRIMAL PARTS AND SUBPRIMAL MEAT CUTS:** Red meat carcasses, primals, subprimals or cuts can be labeled: 1) as the species of origin, e.g., beef tenderloin bearing the simple product name of \u201cbeef,\u201d 2) as species without identifying the primal or subprimal when certain terms associated with various sizes are part of the product name, i.e., chop, cutlet, steak, fillet, filet, roast, strips, etc., e.g., \u201cBeef Steak,\u201d 3) as species and primal or subprimal cut, e.g., "Veal Shoulder Blade Steak," and 4) as species, coin name (butt, cala, daisy, picnic, etc.) and primal or subprimal cut. The species

and coin name are not appropriate as a complete product name since it is missing the primal or subprimal cut, e.g., the phrase \u201cpork picnic\u201d is incomplete without \u201cshoulder.\u201d Recent editions of the \u201cUniform Retail Meat Identity Standards (URMIS),\u201d published and distributed by the National Livestock and Meat Board, and \u201cThe Meat Buyers Guide,\u201d published by the National Association of Meat Purveyors, may be used to identify recommended names. These guides have been prepared through extensive review and analysis of the most recent edition of \u201cInstitutional Meat Purchase Specifications (IMPS)\u201d,"and in cooperation with the U.S. Department of Agriculture, Agriculture Marketing Service (AMS) and public and industry associations. PRIME RIB OF BEEF OR STANDING BEEF RIB ROAST FOR PRIME RIB: These products do not have to be derived from USDA prime grade beef. PRINCIPAL DISPLAY PANEL, ALTERNATE: The determination as to whether or not a panel is an alternate principal display panel shall be based on whether or not the panel is likely to be displayed, presented, shown, or examined under customary conditions of sale. If the intent of the panel cannot be determined and demonstrated, and if it has the appearance of a principal display panel, the presence of three or more mandatory labeling features shall serve to characterize the panel as an alternate principal panel. As such, any remaining mandatory features required to be placed on a principal display panel must be also included. See: Policy Memo 037 dated November 4, 1981 PRODUCT NAMES: 1. A product standard should only be applied if the product name is the same as that described by the standard in the regulations or in the Policy Book. For example, the product, \u201cBeef, Cheese and Vegetables in a Crust,\u201d would not be required to meet the standard for a \u201cturnover\u201d in the policy book. 2. Products such as \u201cPizza Pouches\u201d must meet the standard for pizza since they are named \u201cPizza\u201d even though they are not traditional type pizza. Furthermore, cheese may not be substituted for meat in products named \u201cPizza.\u201d PRODUCT NAME QUALIFIERS: Product name qualifiers have no sizing requirements other than appearing contiguous to the product name and being prominent and conspicuous. Examples of product name qualifiers are \u201cSmoked Flavor Added\u201d and \u201cColored with Paprika.\u201d PRODUCT NAME QUALIFIERS IN SECONDARY PRODUCTS: Product name qualifiers, e.g., \u201cbinders added,\u201d are not required on secondary products with labeling, with the exception of the statement \u201cCalcium Propionate Added to Retard Spoilage of Crust\u201d on pizza labeling. Secondary products are those meal like products that contain a multi-ingredient meat or poultry component, e.g., \u201cLemon Pepper Seasoned Chicken Breast with Rib Meat, Binders Added in \u2018Lemon Pepper Chicken Breast with Vegetable Medley.\u2019\u201d The characteristics of the meat or poultry added ingredients, are disclose in the ingredients statement. See: Policy Memos 112 and 117" "PRODUCT OF USA: Labeling may bear the phrase \u201cProduct of U.S.A.\u201d under one of the following conditions: 1. If the country to which the product is exported requires this phrase, and the product is processed in the U.S., or 2. The product is processed in the U.S. (i.e., is of domestic origin). This entry cancels Policy Memo 080 dated April 16, 1985 PROSCIUTTO: Italian for ham, dry cured. The product name \u201cProsciutto\u201d is acceptable on labeling to identify a dry-cured ham. PROSCIUTTO, COOKED: The product name \u201cCooked Prosciutto\u201d is acceptable on labeling to identify a dry-cured Prosciutto ham that is cooked. PROSCIUTTO COTTO, COOKED HAM: The product name \u201cProsciutto Cotto, Cooked Ham\u201d is acceptable on labeling to identify a regular pickle-cured cooked

ham. Prosciutto Cotto is the Italian name for cooked ham. PROTECTIVE COVERINGS (MEAT): Processed or Prepared Product -Immediate containers, e.g., bags, cardboard cartons, tray packs, and film bags enclosing processed or prepared product can be considered protective coverings and exempt from the marking and labeling requirements if placed in a shipping container which meets all mandatory labeling requirements of an immediate container. This does not exempt the mandatory identification and marking which is specifically required on the immediate container of cooked beef (9 CFR 318.17). In addition, the shipping container must be clearly marked \u201cPacked for Institutional Use\u201d or an equally descriptive statement of intended limited distribution. Unlabeled product may not be removed from shipping containers for further distribution nor displayed or offered for sale.", "Unprocessed Meat Cuts -Transparent film bags enclosing individual meat cuts in an unprocessed state can be considered protective coverings and exempt from the marking and labeling requirements if placed in a shipping container which meets all mandatory labeling of an immediate container. These unlabeled meat cuts may only be removed from the shipping container for resale and further distribution to retailers, hotels, restaurants, and similar institutions if the product itself or the film bag bears a clearly legible official mark of inspection and the establishment number. See: Policy Memo 090B dated December 18, 1990 PROTECTIVE COVERINGS (POULTRY): Under provision of the Poultry Products Inspection Act, protective coverings may be exempt from labeling requirements for immediate containers. Under certain circumstances, some protective coverings are considered immediate containers; under different circumstances, they are regarded only as protective product coverings. When plastic film bags, cardboard cartons, etc., are used for protecting poultry sold for export or to institutions, e.g., hotels, restaurants, and hospitals (where the contents are consumed on the premises), they are exempt from the mandatory labeling of immediate containers, provided the shipping container meets all the labeling requirements for an immediate container. Such product may not be diverted to retail channels and displayed for sale or be sold to household consumers unless they bear all labeling features required for immediate containers. See: 9 CFR 381.65(p) PUDDING: Nonspecific product. PULLED PORK: Refers to pork removed from bones by hand or by mechanical means. The meat must retain its natural striated muscle fiber structure, i.e., it can be shredded, chunked, etc., but may not be ground, chopped, or comminuted. QUALITY GRADE TERMS AND SUBJECTIVE TERMS ON LABELS: Terms designated as grades of meat, i.e., prime, choice, select, good, etc., may only be used on red meat which has been officially graded. However, the Food Labeling Division (FLD) will take no action to rescind currently approved labels which contain the word \u201cselect.\u201d Labels for new or reformulated products or new product lines will be approved in accordance with the policy for grading terms described above.", "Letter grades A,B,C, which are designated grades for poultry, may only be used on poultry (whole birds and parts) that are officially graded and may not be used on red meat. Although poultry grade terms (U.S. grade A, etc.) are not allowed to be used on red meats, the terms prime, choice, and select may be used on poultry (whole birds or parts) that are equivalent to U.S. grade A. The use of a possessive, e.g., XYZ's Prime, does not relieve a company of this requirement. The use of quality grade terms on further processed meat and poultry products will be evaluated on a case-by-case basis to determine if they wrongly imply that the meat or poultry used in these products has been graded. Terms which are subjective in nature, e.g., but not limited to, fancy, finest, super, supreme, ultimate, premium, greatest, best, old fashioned,

homestyle, hotelstyle, deluxe, special, famous, and old time may be used unqualified on labels for meat and\or poultry products. The term \u201cselected\u201d as well as other terms, will be considered individually by the Labeling and Consumer Protection Staff, again to determine if these terms wrongly imply that the meat or poultry has been graded. See: Policy Memo 101A dated August 30, 1988 QUICHE PRODUCTS: The term \u201cQuiche\u201d does not have to be qualified to indicate it is a custard cheese pie. However, when characterizing ingredients, e.g., bacon, ham, chicken, onion, etc. are used either alone or in combination, the ingredients shall be either clearly identified as part of the product name or prominently displayed elsewhere on the principal display panel (PDP) of the label (e.g., Bacon Quiche, Ham and Onion Quiche, etc.). Similarly, the characterizing ingredients in Quiches bearing fanciful names shall be identified as part of the product name or highlighted elsewhere on the PDP (e.g., Quiche Bercy -made with ham and wine). Since \u201cQuiche Lorraine\u201d is widely recognized, the characterizing ingredients do not have to be identified as a part of the product name or elsewhere on the PDP. Meat and poultry quiches must contain at least 8 percent cooked meat or poultry and sufficient cheese so that the combined total at least comprises 18 percent of the finished product. Quiche Lorraine must contain cooked bacon and\or ham and the only cheeses are Swiss and\or Gruyere. If other characterizing ingredients (excluding cheese), e.g., onions, peppers, olives, etc., are used in addition to the meat or poultry ingredient in Quiche Lorraine or in any other quiche, the combination of these other characterizing ingredients and the meat or poultry ingredients must comprise at least 8 percent of the total product, and the cooked meat or poultry portion must be at least 5 percent of the total product. See: Policy Memo 077 dated October 11, 1985","RANCH: The regulations and policies applicable to \u201cFarm\u201d also apply to ranch. RAVIOLI (MEAT): This product must contain at least 10 percent meat.

REHYDRATED DEHYDRATED VEGETABLES: Rehydrated dehydrated vegetables acceptable as name. The specific vegetable must be identified in the ingredient statement. RELLENO DE PAPA (PR): This product must contain 8 percent cooked meat. A Puerto Rican product that must show a true product name, e.g., \u201cPotato Balls with Beef,\u201d or \u201cPotato Dough with a Beef Filling.\u201d RENDERED BEEF FAT TISSUE SOLIDS: The solid remains of a fat extraction process from beef that was ground and rendered by a high temperature (180o F) continuous wet rendering system. See: Beef Greaves REWORK: Rework \u2013 is allowed in unlimited quantities when added to like product. However, if breaded\battered rework is added to similar products, the rework is limited to 2 percent. RICE AND MEAT: The product must contain at least 12 percent meat. ROASTED: The term \u201croasted\u201d may be used to describe products that have been subjected to cooking methods that result in a roasted appearance. ROLLS: Six uses exist for the term \u201cRoll\u201d in conjunction with names for meat food products: 1.Items consisting of a solid piece of meat, for example, \u201cBoned Veal Rib,\u201d formed and tied as a roll and usually offered with seasonings. 2.Chopped meat in combination with condiments, also formed and processed. It can be and often is offered in the fresh meat state." "Water (or any other liquid) is not an ordinary or usual ingredient in the above \u201cMeat Roll\u201d items. If water (liquid) is an ingredient in these products and they are raw, then the product name must contain a descriptive designation in accordance with 9 CFR 317.2(e)(2). If water (liquid) is an ingredient in these products and they are cooked, then the product name must include a containing statement in accordance with Policy Memo 084A. 3. \u201cSausage Rolls\u201d have similar formulas and water limitations to cooked sausage.

The finished product may contain up to 10 percent added water, is in roll shape, and is Cooked, or Smoked and Cured (species) Roll Sausages. 4. Non-descriptive rolls, for example, \u201cPizza Roll,\u201d \u201cPickle Roll,\u201d \u201cRelish Roll,\u201d etc., contain meat with cheese, peppers, pimentos, relishes, and other similar materials. An ingredients statement is required as a part of the product name on the basis of instructions in 9 CFR 317.2(c)(1) and (2), and 317.2(e). 5. Product made from meat and water that has been chunked, ground, chipped, wafer-sliced, etc., and formed into a roll containing a plant protein product or other binder could be labeled as a \u201cMeat, Water, and Textured Vegetable Protein Roll.\u201d The same size lettering is required to be used for the product name. 6. Product made from meat that has been chunked, ground, chipped, wafer-sliced, hydroflaked, etc., and formed in a roll containing a plant protein product or other binder is required to be labeled as \u201cBeef and Textured Vegetable Protein Roll\u201d or \u201cBeef and Soy Protein Concentrate Roll.\u201d ROLLS, POULTRY: Only natural proportions of skin to the whole carcass or designated part may be used. If skin is in greater than natural proportions, the name must be qualified with the term \u201cSkin Added.\u201d See: 9 CFR 381.159 ROMANO CHEESE: Label must show \u201ckind\u201d of milk, e.g., (Caprino), \u201cRomano Cheese made with Goat's Milk;\u201d (Pecornia), \u201cRomano Cheese made from Sheep's Milk;\u201d or (Vaccino), \u201cRomano Cheese made from Cow's Milk.\u201d The words in parenthesis are not required to be shown. RUMAKI: This product must contain at least 50 percent chicken livers. An hors d'oeuvre or appetizer. Rumaki is a combination of chicken livers, water chestnuts, and bacon.", "SALAD -FREEZE DRIED HAM: Antioxidants have been permitted in Freeze Dried Ham at a level of 0.01 percent, based on total weight of the ham. SALAD -GERMAN STYLE POTATO SALAD WITH BACON: Requires at least 14 percent cooked bacon. SALAD MIX, POULTRY: Product must contain at least 45 percent cooked poultry. SALADS: Standards for salads: Meat salads must include at least 35 percent cooked meat or meat food product (e.g., corned beef, ham). Ingredients, e.g., \u201cHam water added\u201d or \u201cCorned Beef and water product\u201d may be used if the formula is adjusted to account for the amount of added substances. Example: if 85 percent of a meat food product is meat, then 35 percent required meat divided by 0.85 equals 41 percent required meat food product in the salad. Cobb Salad - Contains lettuce and chicken or turkey. The other ingredients that may be found include bacon, hard cooked eggs, tomatoes, Roquefort or other blue cheese or dressing. The product name must include the poultry component(s) and also identify any meat ingredient when present about 2 percent, e.g., \u201cBacon and Chicken Breast Cobb Salad.\u201d Caesar Salad - is an acceptable product name and normally contains cheese, meat, or poultry pieces and may contain other vegetables. Ham and Cheese Salad -Must contain at least 25 percent cooked ham. Macaroni with ham or beef -Must contain at least 12 percent cooked meat. Poultry Salad -Must contain at least 25 percent cooked poultry (natural proportions of skin and fat). Chopped egg and ham salad -Must contain at least 12 percent ham. Chopped egg and bacon salad -Must contain at least 12 percent bacon (9 percent fully cooked bacon). Vegetable and/or fruit with poultry -Must contain at least 25 percent cooked poultry. Cracker meal, bread crumbs, and similar ingredients may be included in meat or poultry salads up to 2 percent of the total formula. If more than 2 percent is used, a product name qualifier is required. Modified food starch and textured vegetable protein cannot be substituted for cracker meal and bread crumbs in salad products.", "SALAMI: A dry sausage that requires an MPR of 1.9:1 or less. Extenders and

binders are permitted. It may be cooked to shorten drying period.

**SALAMI, BEEF:** A cooked, smoked sausage, usually mildly flavored, in a large casing, containing coarsely ground beef. Cereals and extenders are permitted. May contain fat. Product does not have to be labeled cooked.

**SALAMI, COOKED:** The product \u201cSalami\u201d must be labeled to include the word \u201cCooked,\u201d regardless of the type and size of its packaging, unless it is one of the following: 1. A salami with a moisture protein ratio of no more than 1:9 to 1; 2. \u201cGenoa salami\u201d with a moisture protein ratio of no more than 2.3:1; 3. \u201cSicilian salami\u201d with a moisture protein ratio of no more than 2.3:1; 4. Labeled, as . . . , a. Kosher Salami, b. Kosher Beef Salami, c. Beef Salami, d. Beer Salami, and e. Salami for Beer. Pork skins are not a permitted ingredient in cooked salami. See: Policy Memo 031A dated July 23, 1986

**SALAMI, COTTO:** A mildly flavored cooked, cured sausage, in a large casing, usually containing coarsely ground beef and pork. The product contains whole or visible pieces of peppercorns. It is cooked in dry heat.

**SALAMI, HARD:** A dry sausage with an MPR of 1.9:1. It is made with beef and pork and seasoned with garlic. Less highly flavored but usually more heavily smoked than Italian Salami. It is tied with loops or twine that gives a scalloped appearance.

**SALAMI, ITALIAN:** This kind of dry salami is usually prepared in the San Francisco area and is easily", "distinguished by its covering of a white mold. This salami consists of about 80 percent finely chopped pork, to which a small amount of pork fat may be added. Nonfat dry milk can comprise 3 1\2 percent of the finished product. The remainder consists of chopped beef, seasoning, salt, and curing agent. The product should have an MPR not in excess of 1.9:1 to insure the fat content and dryness properties associated with a \u201cdry salami.\u201d

**SALCHICHON (SP):** This term, meaning \u201cLarge Sausage,\u201d This term may only be used for large casing sausage products that are 3 inches in diameter or more. Label must show a true product name.

**SALISBURY STEAK:** Finished product must contain at least 65 percent meat. Fat is limited to 30 percent. Other requirements are: 1. It is an unbreaded cooked product. 2. The meat block may contain 25 percent pork, with the remainder beef. Or, the meat block may contain up to 12 percent partially defatted chopped beef and pork. 3. Extenders are permitted up to 12 percent. When isolated soy protein is used, 6.8 percent is the equivalent of 12 percent of the other extenders. Those extenders include, but are not limited to: cereal, bread crumbs, cracker meal, soy flour, soy protein concentrate, isolated soy protein, and textured vegetable protein. 4. Meat byproducts are not permitted. Beef heart meat is permitted. 5. Permitted liquids include, but are not limited to: water, broth, milk, cream, skim milk and reconstituted skim milk (9 parts water to 1 part NFDM). 6. Product not cooked which conforms to the above may be labeled \u201cPatties for Salisbury.\u201d

**SALISBURY STEAK, TURKEY:** Product must contain at least 55 percent turkey meat in natural proportions (light and dark) or 65 percent turkey with skin and fat in natural proportions (skin 10 percent, turkey met 55 percent). Maximum amount of binders and extenders is 12 percent.

**SALPICAO:** A smoked sausage. The label must show a true product name, e.g., \u201cSmoked Sausage.\u201d No more than 3 percent water can be added at formulation.

**SALSICCIA (IT):** A fresh pork sausage, highly spiced, in which paprika is permitted. It is a rope style sausage made of finely cut pork trimming."

**"SALT AS A CURE:** Dry processed hams, pork shoulders, and bacon are ordinarily cured with mixtures that contain mostly salt along with sugar and nitrates plus nitrites. However, some processors use salt alone in preparing their products. The salt in contact with the meat provides the desired cured color, taste, and necessary product protection. Salt is an

acceptable cure when used singly in the curing and salt equalization of dry processed hams, pork shoulders, and bacon. The cured products must have a 10 percent brine concentration.

SAMOSA: This product originated in India, although it is also associated with Pakistan. It resembles a Meat Turnover and consists of a spiced vegetable and meat mixture in a dough crust. At least 25 percent meat is required. Label must show a true product name, e.g., Beef Turnover.

SAMPLES: Free samples included along with the meat and poultry food products are not to be included in the net weight statement, and the ingredients do not need to be identified in the ingredients statement as long as the ingredients appear on sample package.

SANDALWOOD: SANDWICH -CLOSED: Product must contain at least 35 percent cooked meat and no more than 50 percent bread. Sandwiches are not amenable to inspection. If inspection is requested for this product, it may be granted under reimbursable Food Inspection Service. Typical closed-faced sandwiches consisting of two slices of bread or the top and bottom sections of a sliced bun that enclose meat or poultry, are not amenable to the Federal meat and poultry inspection laws. Therefore, they are not required to be inspected nor bear the marks of inspection when distributed in interstate commerce.

SANDWICH -OPEN: Must contain at least 50 percent cooked meat. Sandwiches are amenable only if they are open faced sandwiches. Product must show a true product name, e.g., Sliced Roast Beef on Bread.

This regulatory policy in no way alters the Department's present policy with respect to caterers who include meat sandwiches in their dinners.

SANDWICHES (MEAT OR POULTRY AS COMPONENTS OF DINNER PRODUCTS): Dinners containing a sandwich type product, e.g., a frankfurter, hamburger, or sliced poultry meat with a bun, are amenable and subject to inspection.", "SANTA FE STYLE: Acceptable for products that contain chilies with corn or beans and one of the following ingredients: Cheese (jack, cheddar, Mexican Style or fresh goat), bell pepper, onion, garlic, tomatoes, tomatillos, cumin, oregano or cilantro. The beans should be either black, kidney, navy, pink, pinto, red, or white beans or an indigenous variety.

SARNO: A dry smoked sausage that is air dried. The label must show a true product name, e.g., Smoked Sausage.

Coarsely chopped beef, pork, and garlic are not permitted.

SATAY: This term refers more to a preparation method than to the nature of a finished product. Satay can be made from chicken, beef, lamb, pork, and other food items, and prepared in two ways: 1. Meat is cut into one inch cubes, then dipped into a spicy sauce, skewered, and roasted over an open fire (similar to Kebobs except no vegetables or fruit). Label must show a true product name, e.g., Beef Cubes on Stick.

2. Meat is cut into one inch cubes, then dipped into a spicy sauce and canned. Label must show a true product name, e.g., Beef Cubes in Spicy Sauce.

SAUCE WITH MEAT OR MEAT SAUCE: Product must contain at least 6 percent ground meat.

SAUERBRAUTEN (GR): Sauerbrauten must contain at least 50 percent cooked beef.

Gravy with Sauerbraten must contain at least 35 percent cooked meat. Sauerbrauten is cooked beef in a vinegar flavored sauce. The beef is marinated in vinegar sauce, then separated from the sauce and partially cooked, and put back in the sauce and cooked completely.

SAUERKRAUT BALLS WITH MEAT: Product must contain at least 30 percent meat or meat food product.

SAUERKRAUT WITH FRANKS AND JUICE: Product must contain at least 20 percent franks.

SAUSAGE CLASSIFICATION: Fresh Sausage: Made of fresh, uncured meat, generally cuts of fresh pork, and sometimes beef. Its taste, texture, tenderness, and color are related to the ratio of fat to lean. Trimmings from primal cuts, e.g., pork, loin,

ham, and shoulders are often used. When ice or water is used to facilitate chopping and mixing, it is limited to a maximum of 3 percent of the total formula. It must be kept under refrigeration and thoroughly", "cooked before serving. Bratwurst is in this class. Binders and extenders are permitted in fresh sausages except where regulations do not permit the use of such ingredients, i.e., 9 CFR 9 CFR 319.140 (Pork Sausage), 9 CFR 319.142 (Beef Sausage), 9 CFR

319.144 (Whole Hog Sausage), and 9 CFR 319.145 (Italian Sausage). See: 9 CFR 319 Subpart E  
Uncooked smoked sausage: Has all the characteristics of fresh sausage except it is smoked, producing a different flavor and color. It must be thoroughly cooked before serving.

\u201cSmoked Pork Sausage\u201d is included in this class. If it is a mixture of pork and other meats, regardless of size, it must be treated for trichinae. See: 9 CFR 319 Subpart F Cooked sausages and\|or Smoked sausages: These products are chopped or ground, seasoned, cooked and\|or smoked. Added water is limited to 10 percent of the finished product. Meat byproducts may be used when permitted by standard. Cure is required for particular sausages, e.g., wieners or Polish sausage. These sausages come in various shapes and sizes, e.g., short, thin, long and chub. Cotto salami, liver sausage, and cooked weisswurst are included in this category.

Wieners, bologna, knockwurst, etc., are also in this class but are further distinguished by a fat and moisture limitation. See: 9 CFR 319.180 Dry and Semi-dry sausages: Dry sausages may or may not be characterized by a bacterial fermentation. When fermented, the intentional encouragement of a lactic acid bacteria growth is useful as a meat preservative as well as producing the typical tangy flavor. The meat ingredients, after being mixed with spices and curing materials, are generally held for several days in a curing cooler. Afterward, the meat is stuffed into casings and is started on a carefully controlled air-drying process. Some dry sausage is given a light preliminary smoke, but the key production step is a relatively long, continuous air-drying process. Principal dry sausage products are salamis and cervelats. Salamis are coarsely cut, cervelats finely cut with few exceptions. They may be smoked, unsmoked, or cooked. Italian and French dry sausage are rarely smoked; other varieties usually are smoked.

Dry sausage requires more production time than other types of sausage and results in a concentrated form of meat. Medium-dry sausage is about 70 percent of its \u201cgreen\u201d weight when sold. Less dry and fully dried sausage range from 80 percent to 60 percent of original weight at completion. Semi-dry sausages are usually heated in the smokehouse to fully cook the product and partially dry it. Semi-dry sausages are semi-soft sausages with good keeping qualities due to their lactic acid fermentation. Although dry and semi-dry sausages originally were produced in the winter for use in the summer and were considered summer sausage, the term \u201csummer sausage\u201d now refers to", "semi-dry sausages, especially Thuringer Cervelat.

SAUSAGE CONTAINING CHEESE: Sausages may contain cheese under the following conditions: 1. If there is a standard for that particular sausage, it must be met as though it contained no cheese. 7. The cheese must characterize the product and appear as part of the product name. Example \u201cItalian Sausage with Cheese.\u201d See: Policy Memo 010 dated September 8, 1980

SAUSAGE -LIQUIDS ADDED: Sausages containing fluid ingredients that are expected such as fruit and juice and vinegar, are permitted at any level as long as the product is descriptively labeled. The sausage portion of the product, however, must meet any applicable standard. Vinegar is an expected ingredient in chorizos and the name does not have to indicate its presence. SAUSAGE -SHELF STABLE: Dry sausage must have a Moisture Protein Ratio (MPR) of 1.9:1 or less, unless an MPR is cited under MOISTURE PROTEIN RATIO. Non-

refrigerated, semi-dry, shelf-stable sausage must have an MPR of 3.1:1 or less and a pH of 5.0 or less, unless commercially sterilized or unless an MPR is cited under MOISTURE PROTEIN RATIO. Alternately, non-refrigerated, semi-dry, shelf-stable sausages are those that: 1. are fermented to a pH of 4.5 or lower (or pH may be as high as 4.6 if combined with product water activity no higher than 0.91), 2. are in an intact form or, if sliced, are vacuum packed, 3. have internal brine concentration no less than 5 percent, 4. are cured with nitrite or nitrate, and 5. are smoked with wood.

**SAUSAGE, REWORK:** This term applies to a fully or partially processed product (excluding uncooked trimmings) re-routed for reasons other than unwholesomeness or adulteration (i.e., emulsion residue, product breakage, slicing operations, smoked meats, returns, etc.) and intended for inclusion in cooked sausage, loaves, and similar products. Rework may be used provided it does not adulterate the product, violate its standard of composition, change the order of predominance of ingredients, or perceptibly affect the "normal", "characteristics of the product. Rework is subject to the following restrictions: 1. Cooked sausage, meat loaves may be used in similar products without limitation. 2. Except in products covered by section 9 CFR 319.180, pieces of cooked and\or smoked meat may be used without limitation if properly identified in the ingredients statement. 3. Pieces of uncooked, cured pork from primal parts may be used without limitation if properly identified in the ingredients statement. 4. Sausage products in edible collagen casings may be used in similar finely comminuted products without limitation and need not be peeled. 5. Finished cooked sausage in natural casings may be used in similar finely comminuted products without limitation, except sausages in bungs, middles, beef rounds, bladders, or stomachs, which must be stripped of the casings before use. Also, natural casings of any type that break during the stuffing operations should not be included in emulsions.

**SAUSAGE TYPE PRODUCTS WITH FRUITS AND VEGETABLES:** Sausage type products that contain unexpected ingredients that significantly alter the character of the product may be descriptively labeled as (characterizing ingredient) Sausage, e.g., \u201cCherry Pecan Sausage,\u201d \u201cWild Rice Sausage,\u201d or other equally descriptive names, e.g., \u201cSausage with Wild Rice.\u201d The sausage portion of fresh sausage products must meet any applicable standards, including fat and added water limitations, moisture\protein ratios, and use of binders and extenders prior to the addition of any characterizing ingredient(s). For cooked, smoked, or dry sausages, the finished sausage type product must meet the sausage standard prior to the addition of any characterizing ingredients. The unexpected ingredient must be present in sufficient quantity or form to characterize the sausage type product in flavor, texture, or other sensory attributes. However, there are no minimum use levels. This policy applies to products containing unexpected food ingredients, e.g., fruits and vegetables, e.g., cherries, pecans, tomatoes, etc., that change the character of the product by the addition of unique flavor and other sensory characteristics. The policy does not apply to imitation products, i.e., products formulated to resemble in taste, texture, color, etc., the traditional sausage products, but which are nutritionally inferior. Sausages containing cheese are addressed Policy Memo 010, and Potato Sausages are addressed in Policy Memo 011.

**SAUSAGE WITH SAUERKRAUT IN SAUCE:** Product must contain at least 40 percent sausage.", "SAUSAGE (Species): (Species) sausages identified in 9 CFR 319.141, 319.142, 319.144, and 319.160 of the meat inspection regulations may be cooked, cured or smoked (or any combination), but must comply with the standards before being processed if the product name is to include \u201c(species) sausage.\u201d For example,

fresh beef sausage identified in 9 CFR 319.142 which is cured and cooked may be labeled \u201ccured, cooked beef sausage.\u201d Prior to this processing, these products could not contain more than the 3 percent water permitted by the standard. Cooked cured sausages or smoked cured sausages containing up to 10 percent added water in the finished product and prepared from one species may be labeled as \u201ccooked cured sausage,\u201d \u201csmoked sausage,\u201d \u201ccooked cured sausage made with (species),\u201d or \u201csmoked sausage made with (species).\u201d Semi-dry and dry sausages made from a single species may be labeled \u201c(species) sausage,\u201d e.g., \u201cbeef sausage.\u201d This policy does not apply to cooked sausages identified in section 9 CFR 319.180 of the meat regulations. See: Policy Memo 051 dated September 13, 1982 SCALLOPED POTATOES AND HAM: Product must contain at least 20 percent cooked ham. SCALLOPED POTATOES AND SAUSAGE: Product must contain at least 20 percent cooked sausage. SCALLOPED POTATOES FLAVORED WITH SAUSAGE: Product must contain at least 3 percent sausage. SCALLOPPINI: Product must contain at least 35 percent cooked meat or poultry meat. Thin slices of cooked veal, sometimes beef or poultry, seared or fried. Label must show a true product name, e.g., \u201cVeal Scaloppini\u201d or \u201cChicken Scaloppini.\u201d SCHICKENWURST (GR): The product is made of two parts, one of which is an emulsion prepared from pork and beef cuts. The second component consists of chunks of ham measuring from 2 to 3 inches in size. The two parts are mixed, stuffed into large casings, and smoked while being cooked. The final product appears as a luncheon sausage with large pieces of red ham meat held together by a light pink binder. The ham sections comprise at least 50 percent of the product and the item has a distinct smoked flavor. This product is very similar in appearance to the product sold as \u201cHam Bologna.\u201d "SCRAMBLED EGGS WITH BACON": Product must contain at least 10 percent cooked bacon. SEAWEED: The term is not an acceptable ingredient declaration. There are many types of seaweed, some are not as safe. \u201cSERVING SUGGESTION,\u201d \u201cSERVE AS SUGGESTED,\u201d AND SIMILAR PHRASES: Vignettes should reasonably illustrate ingredients that could be in the packaged products as sold, and not be misleading to the consumer. See: 9 CFR 317.8 9 CFR 381.129 SHEPHERDS PIE (With or Without Vegetables): Product must contain at least 25 percent meat in total formulation. Shepherds Pie is a meat food product consisting of chopped, minced, or cubed beef or lamb, seasoned with gravy or sauce, with or without vegetables, and baked with a covering layer or surrounding border of seasoned mashed potatoes. The label must show a true product name, e.g., \u201cBeef Shepherds Pie.\u201d SHIPPING CONTAINERS: A mark of inspection and a handling statement is required on all shipping containers. Safe Handling Instructions are required with all other required features only when they shipping container is also the immediate or primary container. See: 9 CFR 316.13 SHU-MAI: Product must contain at least 10 percent meat. A Chinese product that resembles a dumpling. It is similar to a meat ravioli. The label must show a true product name, e.g., \u201cPork Dumpling\u201d. SIGNATURE LINE: It is not necessary to include the term \u201cGeneral Office\u201d in signature lines on labels used by companies with multiple plant operations. A zip code shall appear following the address. See: 9 CFR 317.2(g)(1) 9 CFR 381.122", "SLOPPY JOE: A coined name that must be qualified by a true product name, e.g., \u201cBarbecue Sauce with Beef.\u201d The meat content depends on the name of the product. Heart meat and tongue meat can be used but not to satisfy the minimum meat requirement. SMOKE: For imported Canadian products, e.g., bacon, which are physically

smoked during processing, the word \u201cSmoke\u201d is acceptable in the ingredients statement. Although not required or customary, smoke can also appear in the ingredients statement of domestically produced products which are physically smoked. If included in the ingredients statement, smoke should appear as the last item. SMOKE FLAVORING: The use of smoke flavoring (natural or artificial) in a component of a meat or poultry food product, e.g., ham in a ham salad, does not require that the product name be qualified to indicate the presence of the smoke flavoring. However, the smoke flavoring must be declared in the ingredients statement on the meat or poultry product labels. Secondary product \u2013 when meat and extender product is produced using a meat product in which smoke flavoring is added, the secondary product name does not have to be qualified with a phrase as \u201csmoke flavoring added.\u201d When smoke flavor (natural or artificial) has been directly added to a product as part of a seasoning mix, the presence of the smoke flavor must be identified in a qualifying statement to the product name, e.g. 1. \u201cChicken soup smoked flavor added,\u201d and in the ingredients statement. 2. \u201cBeef soup smoke flavor.\u201d 3. If a product is simply sprayed with liquid smoke, it must be labeled \u201csmoke flavoring added.\u201d See: Policy Memo 117 dated August 30, 1988 SMOKED PRODUCTS: The guidelines for approving labels for products prepared with natural smoke and\or smoke flavor (natural or artificial) are as follows: 1. Meat or poultry products which have been exposed to smoke generated from burning hardwoods, hardwood sawdust, corn cobs, mesquite, etc., may be labeled as \u201cSmoked\u201d or with terms, e.g., \u201cNaturally Smoked\u201d to indicate that the traditional smoking process is used. 2. Meat or poultry products which have been exposed to natural liquid smoke flavor which has been transformed into a true gaseous state by the application of heat or transformed into vapor by mechanical means, e.g., atomization, may be labeled \u201cSmoked.\u201d", 3. Meat or poultry products may be labeled \u201cSmoked\u201d if natural liquid smoke flavor is applied by spraying, dipping, liquid flooding, or similar processes prior to or during heat processing. In such cases, the natural liquid smoke flavoring must be transformed into a true gaseous state by the heat of processing. If a product is simply sprayed with liquid smoke it must be labeled \u201csmoke flavoring added.\u201d 4. Meat or poultry products to which smoke flavor (natural or artificial) has been directly applied to the exposed product surface, e.g., massaging or margination, or incorporated into the product by such means as injection, must be labeled to identify the smoke flavor as part of the product name, e.g., \u201cHam-Natural Smoke Flavor Added,\u201d and in the ingredients statement. 5. Meat or poultry products that are smoked, as provided for in (1), (2) and (3) above and also treated with smoke flavor as described in (4), may only be labeled \u201cSmoked\u201d or with terms, e.g., \u201cNaturally Smoked,\u201d if it is clearly disclosed that the product is also treated with smoke flavor. The presence of the smoke flavor must be identified as part of the product name, e.g., \u201cSmoked Ham-Smoke Flavoring Added\u201d and in the ingredients statement. 6. Product may be labeled as \u201chickory smoked\u201d only if the plant provides the inspector with appropriate certification that such sawdust or wood for smoking is 100 percent hickory. See: Policy Memo 040 dated January 18, 1982 Policy Memo 058A dated August 5, 1983 SMOKED THURINGER LINKS: A cooked smoked sausage made with pork only. SNACKS (HORS D'OEUVRES): Product must contain at least 15 percent cooked meat or 10 percent cooked bacon. The label must show a true product name, e.g., \u201cLiver Pate on Toast.\u201d SODIUM ALGINATE: This is

added as a binder in \u201cTaquitos.\u201d Approval may be given for use at a level of less than 1 percent with .25 percent of calcium citrate to stabilize a pizza sauce or pizzas heated in household toasters. Sodium alginate when used as glue to seal burrito and burrito like products is acceptable, if declared in the ingredients statement, or if a statement such as \u201csealed with sodium alginate\u201d appears at the end of the ingredients statement.

**SODIUM BENZOATE:** Sodium Benzoate is not an acceptable ingredient for meat and poultry products, except in oleomargarine. It is accepted as an incidental additive when it is a part of a product", "prepared under FDA rules, e.g., sauces, gravies, and similar substances.

**SOFRITO WITH PORK:** This is a sauce containing 6 percent smoked pork.

**SOPPRESATE (IT):** This is an acceptable name for a dry salami with an MPR of 1.9:1. This is an Italian salami that is lightly flavored with garlic and, generally, hotly seasoned with paprika and black or red peppers. It is smoked to varying degrees depending on regional tastes.

**SORBITOL:** This is only permitted in 9 CFR 319.180 products, cured pork products, dried beef, kielbasa and products similar to kielbasa. Do not approve when used in other products.

**SOUFFLE (SPECIES) OR (KIND):** Product must contain at least 18 percent cooked meat or poultry meat.

**SOUJOUK (TK):** This is a Turkish sausage made from beef which is very dry and highly spiced with an MPR of 2.04:1. The product is usually flattened or resembles a dry salami or ring bologna. The label must show a true product name, e.g., \u201cDried Beef Sausage.\u201d

**SOUP:** 1. Soups that declare meat stock in the product name are meat food products and shall contain at least 25 percent meat stock with an MPR of not less than: a. Condensed soup -67:1 b. Ready-to-eat -135:1 c. Beef Bouillon - 67:1 and at least 50 percent beef stock 2. Soups made with meat shall contain not less than: a. Condensed soup -4 percent cooked meat b. Ready-to-eat -2 percent cooked meat 3. Soups containing smoked meats shall contain not less than: a. Condensed soup -4.0 percent smoked meat b. Ready-to-eat -2.0 percent smoked meat 4. Soups made with cooked sausages shall contain at least 4 percent cooked sausage. See: Policy Memo 122 dated August 11, 1992","**SOUP PRODUCTS:** Bean & Ham Shank: When soup is made from ham shanks, they must be shown in the true product name, e.g., \u201cBean and Ham Shank Soup.\u201d Blood: Product must contain at least 1 percent blood and be made under inspection.

**Chowders:** Follow standard for soups.

**Consomme:** A broth cooked with vegetables and then strained. Must have an MPR of 135:1.

**Consomme Instant:** Dehydrated -not amenable.

**Cream:** Condensed cream soups may be made from various creams, whole milk, or dry milk powder. The amount of cream, whole milk, or dry milk powder should provide a minimum of .45 percent butterfat to the final product. Examples: A cream containing 18 percent butterfat should make up the product formulation; this provides .45 percent butterfat to the product formulation.

**1. Dry milk powder containing 27 percent butterfat should make up 1.67 percent of the product formulation.**

**Dried Meat Soup Mixes:** Not amenable.

**Italian Style Minestrone:** Soup must contain zucchini. Identify meat in the true product name.

**Pepper Pot:** Soup must contain at least 20 percent scalded tripe.

**Petite Marmite (FR):** A soup made with meat, chicken, and vegetables.

**Scotch Broth:** Soup must contain at least 3 percent mutton in a thick mutton broth.

**Vegetable:** Vegetable soups made with soup stock are not considered amenable.

**SOUSE:** This is a nonspecific product that can be made with all pork byproducts. The ingredients statement directly follows the product name.

**SOUTHERN FRIED:** Southern fried poultry cuts or patties are breaded and fried. This is not geographical.

**SOUTHWESTERN STYLE:** An acceptable identification for products containing any five (5) of the following types of food

ingredients:,"Beans (kidney beans, black beans, pinto beans, red or pink beans), corn, chili peppers, bell peppers, cheddar cheese, cilantro, onions or onion powder, cumin, oregano, garlic or garlic powder, paprika, chili powder, either mesquite smoked, or mesquite smoke flavor added. SOY PROTEIN PRODUCTS: Whenever soy flour, defatted soy grits, soy protein concentrate, isolated soy protein, and similar products are used as ingredients of meat and poultry products, they must be called by their common or usual name (e.g., soy flour, soy protein isolate, etc.). Two percent isolated soy protein is equivalent to 3.5 percent binders. If these products are textured, then \u201ctextured\u201d should also be included in the name. We allow the use of the term \u201ctextured vegetable protein\u201d when the textured soy products are mixed with spices, colorings, enrichments, etc., and the ingredients of the textured vegetable protein are listed parenthetically. \u201cVegetable Protein Product\u201d is an acceptable declaration for a soy product fortified in accordance with Food and Nutrition Service regulations. The ingredients of the VPP must be listed parenthetically. SPAGHETTI: Sauce with meatballs Must contain at least 35 percent cooked meatballs Sauce with meat Must contain at least 6 percent meat with meatballs Must contain at least 12 percent meat with meatballs & sauce Must contain at least 12 percent meat with meat and sauce Must contain at least 12 percent meat with franks and sauce Must contain at least 12 percent franks SPAGHETTI SAUCE WITH MEAT STOCK: This spaghetti sauce consists mainly of tomatoes with seasoning. Product must contain 5 percent fresh beef and 12.5 percent concentrated meat stock. SPAGHETTOS IN CHEESE SAUCE WITH GROUND BEEF: Product must contain at least 12 percent meat. SPANISH RICE WITH BEEF: Product must contain at least 20 percent cooked beef. SPECKWURST: Product should conform to sausage standard (9 CFR 319.140) without the use of","byproducts. Chunks of fat are usually present. STARCH: Starch, wheat starch, and cornstarch are synonymous in meaning. When \u201cVegetable Starch\u201d is used as a designation, it refers to the starchy materials derived from any vegetable source, e.g., potatoes, peas, etc. Tapioca starch cannot be declared as \u201cstarch.\u201d See: Tapioca Starch STEAK, CHINESE PEPPER: Product must contain at least 30 percent cooked steak. A Chinese dish usually served with rice. Beef steak is cut in thin strips, browned, and added to a sauce. Vegetables are also added to the sauce; green pepper strips are always used, and other vegetables may include celery, onions, scallions, red pepper, bean sprouts, tomatoes, or water chestnuts. STEAK, COUNTRY STYLE: This term is popular in the Southern region of the country. It resembles a \u201cGravy and Swiss Steak\u201d product. Characteristics of this product are: 1. It is prepared from the steaking portions of beef (usually from the round) and braised. 2. The meat is mechanically \u201ctenderized\u201d and floured prior to browning. 3. The meat is browned by saut\u00e9ing or oven browning, but not flame browned nor cooked in water. 4. When a true product name is shown as \u201cGravy and Beef Steak,\u201d at least 35 percent cooked steak must be used. 5. When a true product name is shown as \u201cBeef Steak with Gravy,\u201d at least 50 percent cooked steak must be used. STEAK, PEPPER: Product must meet the standard for \u201cFabricated Steak\u201d in 9 CFR 319.15(d) and contain green and\or red peppers. STICKS: There are three types of meat or poultry sticks. 1. Meat Sticks, which are an extended \u201cpattie-like\u201d product and are usually breaded. No more than 10 percent extenders and 30 percent breading are permitted. When whole egg, tomato, and nonfat dry milk are used, they must appear as added ingredients in the true product name, e.g., \u201cBREADED MEAT STICK -NONFAT DRY MILK ADDED. 2. The infant finger food type of sticks

is usually packed in jars. It conforms to the sausage standard and must show a true product name, e.g., "Meat Stick.", "3. Nonspecific dry or semi-dry sticks that do not meet the sausage standard must be followed by the ingredients statement. If products meet the sausage standard, they may be identified as Smoked Sausage." STROGANOFF, MEATBALL: Product must contain at least 45 percent cooked meatballs. Sauce portion shall comply with the Stroganoff Sauce standard. STROGANOFF SAUCE: The sauce must contain at least 10 percent sour cream or a combination of at least 7.5 percent sour cream and 5 percent wine, or 2 percent sour cream, 2 1/2 percent wine, and 9 1/2 percent whole milk.

STROGANOFF SAUCE WITH AND BEEF: Product must contain at least 31 percent beef or 21 percent cooked beef based on the total weight of the product, with sauce portion complying with the stroganoff sauce standard. STROGANOFF SAUCE WITH AND MEATBALLS: Product must contain at least 31 percent cooked meatballs. Sauce portion shall comply with the stroganoff sauce standard. STROMBOLI (IT): Product is not considered a traditional sandwich. Minimum meat requirement is 25 percent fresh or 18 percent cooked meat. The label must show a true product name, e.g., "Pepperoni and Cheese Wrapped in Dough."

STUFFED CABBAGE WITH MEAT IN SAUCE: Product must contain at least 12 percent meat or at least 8 percent cooked poultry. STUFFED PEPPERS WITH MEAT IN SAUCE: Product must contain at least 12 percent meat or at least 8 percent cooked poultry. SUKIYAKI: Product must contain at least 30 percent beef. Sukiyaki consists of cut up vegetables, e.g., mushrooms, leeks and celery, which are cooked briefly with thin slices of beef and soy sauce. SULFITING AGENTS: The presence of sulfiting agents (sulfur dioxide, sodium sulfite, sodium bisulfite, potassium bisulfite, sodium metabisulfite, and potassium metabisulfite) must be declared on the label if their concentration in the finished meat or poultry food product is 10 PPM, or higher. However, some finished meat and poultry food products may be comprised of multiple separable components, e.g., potatoes or apple cobbler in frozen dinner. For these products, if a separable component contains 10 PPM or more sulfiting agents, the sulfiting agents must be declared even though the total product contains less than 10 PPM of sulfiting agents. When sulfiting agents are required to be declared under conditions described above, their declaration shall be according to the following: 1. Sulfiting agents shall be declared by their specific name or as "sulfiting agents." 2. Declaration shall be in the ingredients statement in order of predominance or at the end of the ingredients statement with the statement "This Product Contains Sulfiting Agents" (or specific name(s)). 3. When the total product contains less than 10 PPM, but a separable component contains 10 PPM or more, the sulfiting agent must be declared as part of the component according to (1) and (2) above. See: Policy Memo 094B dated December 17, 1986 SUMMER SAUSAGE: Product may be a semi-dry or cooked sausage. Meat byproducts and extenders are permitted. SWISS STEAK: Swiss Steak and Gravy: Contains not less than 50 percent cooked beef. Gravy and Swiss Steak: Contains not less than 35 percent cooked beef. Product labeled "Swiss Steak" must be floured or dusted before searing, or may have flour added to gravy. SWEET AND SOUR PORK, BEEF OR POULTRY: Product requires at least 25 percent meat or poultry meat, or 18 percent cooked meat or poultry meat. Product also requires sufficient traditional sweet and sour ingredients (fruit, fruit juices, vinegar, etc.) to impart sweet and sour characteristics. SZECHWAN STYLE: Acceptable identification for any product containing one item from three or the four groups below. 1. Soy sauce. 2. Spring onions, scallions or leeks.", "3. Garlic, ginger, ginger root. 4. Chili,

Szechwan peppercorn, Chili oil. TACO: Product must contain at least 15 percent meat. TACO FILLING: Product must contain at least 40 percent fresh meat. The label must show true product name, e.g., \u201cTaco Filling with Meat,\u201d \u201cBeef Taco Filling,\u201d or \u201cTaco Meat Filling.\u201d TACO FILLING, KIND: Product must contain at least 40 percent raw poultry meat. TAGS, TISSUE STRIPS, BRANDS: When tags, tissue strips, brands, etc. are used to apply ingredients statements on sausages and other products in casings or link form, the only additional marking required is the official inspection legend. However, if other features are added, e.g., the product name, all applicable required labeling features are required. See: 9 CFR 316.10 TALLOW: Acceptable product name for the meat food product consisting of rendered beef fat or mutton fat or both. TAMALES: Product must contain at least 25 percent meat. Tamales prepared with meats other than beef and\or pork must include them in the product name, e.g., \u201cChicken Tamale\u201d or \u201cChicken and Beef Tamale\u201d. See: 9 CFR 319.305 When inedible wrappings are used, they must be indicated: a. In the product name, e.g., \u201cBeef Tamale Wrapped in Corn Husk.\u201d b. As a qualifier to the product name, e.g., \u201cremove parchment paper prior to eating,\u201d or", "c. As information in the preparation instructions, e.g., \u201cremove the inedible covering prior to serving.\u201d The wrapper cannot be included as part of the net weight. Filling -must contain at least 40 percent beef. Pie -must contain at least 20 percent fresh meat. Filling must be at least 40 percent of the total product. (kind) -must contain at least 6 percent poultry meat. (kind) With sauce or gravy - must contain at least 5 percent poultry meat. (species) -must contain at least 25 percent meat. (species) With sauce or gravy -must contain at least 20 percent fresh meat. If byproducts are used, their presence must be included in the product name. TAPIOCA PRODUCT: Tapioca flour \u2013 can be used as a binder in some products in which \u201cstarchy vegetable flour\u201d is permitted, as long as it is declared as tapioca flour. Tapioca starch \u2013 can be used as a binder in some meat and poultry products n which \u201cvegetable starch\u201d is permitted as long as it is declared as \u201ctapioca starch or food starch.\u201d Tapioca starch cannot be declared as \u201cstarch.\u201d TAQUITOS: A Mexican dish requiring at least 15 percent meat. Cooked meat product is cut into strips or shredded and placed in center of tortilla. The tortilla is then rolled around the filling. TASAJO SALTED BEEF (SP): MPR not to exceed 2:1. Product is stitch pumped and cured in salt brine for 72 hours or more after which it is dried with circulated warm air for a period of at least 20 days. If the item is dipped in a tallow mixture, a statement must be shown contiguous to the product name identifying the constituents of the dipping mixture. TEAWURST OR TEEWURST: A cooked or uncooked product processed with or without curing and cold smoked 2 to 5 days. It is ground or coarsely chopped and is characterized by a soft spreadable texture.", "Typical meat ingredients include: pork, beef, pork bellies, and bacon. Fresh pork bellies may be used in place of pork fat and bacon. TEMPURA: A Japanese dish consisting of shrimp, fish, vegetable, meat, poultry etc., each dipped in an egg batter and deep fried. The label must show true product name, e.g., \u201cChicken Tempura,\u201d \u201cPork Tempura,\u201d etc. TERIYAKI, MEAT OR POULTRY (COOKED): Cubes or slices of cooked meat or poultry which have been marinated in a sauce containing soy sauce, some kind of sweetener, and usually ginger, garlic, or wine. When the cooked marinated product is combined with additional sauce the product name is required to reflect the sauce; for example, \u201cBeef Teriyaki with Sauce.\u201d See: Teriyaki Products when product has not been cooked TERIYAKI PRODUCTS: Meat and poultry teriyaki products are not required to be cooked,

provided a prominent statement is on the principal display panel informing the consumer that the product is not cooked. Example: \u201cCook and Serve,\u201d \u201cRaw,\u201d and \u201cReady to Bake.\u201d In addition, raw \u201cteriyaki\u201d meat or poultry products with added solutions must be labeled in accordance with 9 CFR 317.2(e)(2) or 9 CFR 381.117(h). See: Policy Memo 012 dated September 8, 1980 (Uncooked Meat and Poultry Teriyaki)

TETRAZZINI, POULTRY OR BEEF: Product must contain at least 15 percent cooked poultry or cooked beef. Made with diced cooked poultry or meat in a rich cream sauce containing sherry. This is added to cooked spaghetti or noodles in a casserole. Usually topped with bread crumbs or grated cheese. TEXTURED VEGETABLE PROTEIN (Textured Vegetable Protein Product) FOR COOKED MEAT and\or POULTRY MEAT: If the cooked meat and\or poultry meat to TVP ratio exceeds 9:1, then the TVP is declared by its common or usual name in the ingredients statement only. If the cooked meat and\or poultry meat to TVP ratio is less than 9:1 but at least 7:1, the label must contain a qualifying phrase contiguous to the product name, e.g., \u201cChicken Salad, Textured Vegetable Protein Added.\u201d If the cooked meat and\or poultry meat to TVP ratio is less than 7:1, the TVP must be shown in the product name, e.g., \u201cChicken and Textured Vegetable Protein Salad.\u201d", "TEXTURED VEGETABLE PROTEIN (TVP) PRODUCTS-FRESH MEAT OR POULTRY MEAT RATIOS: The following guidelines and labeling requirements have been established regarding use of TVP in products other than patties and pizza toppings. If the ratio of fresh meat or poultry meat to TVP is greater than or equal to 13:1, the TVP product is not considered to be characterizing or deceptive, e.g., 40 percent fresh meat: 3 percent textured soy flour = 13.3:1, and the TVP need only to appear in the ingredients statement. If the ratio of fresh meat or poultry meat to TVP product is less than 13:1 but greater than or equal to 10:1, the TVP is characterizing and must be shown as a product name qualifier contiguous to the product name, e.g., \u201cHot Dog Chili Sauce made with Beef Textured Vegetable Protein added.\u201d If the ratio of fresh meat or poultry meat to TVP is less than 10:1, the TVP must be part of the product name, e.g., as \u201cBeef and Textured Vegetable Protein Hotdog Chili Sauce\u201d or \u201cHotdog Chili Sauce Made with Beef and Textured Soy Flour.\u201d THAI STYLE: Acceptable identification for products containing at least five of the following: Basil, chilies or chili products, cilantro, coconut or coconut products, coriander, cumin, fish sauce, galangal, garlic, ginger, green onions, jasmine rice, lemon grass, peanuts or peanut products, rice noodles, shallots, or soy sauce. THURINGER: Usually classed as a \u201cSemi-Dry\u201d sausage with an MPR of 3.7:1. It is usually smoked and complies with the following factors: 1. Pork fat as such may comprise up to 10 percent of the total ingredients. 2. Heart meat (Beef or Pork) may comprise up to 50 percent of meat ingredients. 3. Tongue meat (Beef or Pork) may comprise up to 10 percent of meat ingredients. 4. Cheek meat (Beef or Pork) may comprise up to 50 percent of meat ingredients. 5. No binders or extenders are allowed. 6. \u201cCooked Thuringer\u201d can contain up to 10 percent added water.", "7. Acceptable product names for uncooked Thuringer include: \u201cBeef Summer Sausage -Thuringer Cervelat\u201d and \u201cSummer Sausage -Thuringer Cervelat.\u201d TIPS: Is the sub-primal of the beef round and is often referred to as the \u201cSirloin Tip.\u201d If the term \u201cTips\u201d is used for other than from the \u201cSirloin Tip,\u201d it must be qualified as to the specific part of the primal such as \u201cBeef Ribs Tips.\u201d TITANIUM DIOXIDE: When Titanium Dioxide is used in poultry salads, a qualifying phrase should appear under the product name stating that the product has been

\u201cArtificially Whitened\u201d or \u201cArtificially Lightened.\u201d TOCINO: Spanish word for salt Pork or Bacon. Except in Puerto Rico, must show and use true product name in English, e.g., bacon, salt pork. TOCINO (Filipino or Philippine Style): The thinly sliced piece of meat taken from either the hind leg or shoulder portion of the pork carcass. The product is treated with salt, sugar, and nitrite and\or nitrates, with optional ingredients of ascorbic acid, spices, monosodium glutamate, and phosphates. Acceptable color agents are annatto, beet powder, and paprika that are required to be shown as \u201cartificially colored.\u201d A true product name is required to be shown on the label, for example, \u201cSliced Marinated Cured Pork Shoulder Butt.\u201d In addition, raw \u201ctocino\u201d meat products with added solutions must be labeled in accordance with 9 CFR 317.2(e) (2). TOCINO, POULTRY: Acceptable with a true descriptive product name, e.g., \u201cChicken Tocino, Sliced, Marinated, Cooked, Cured Chicken Thigh Meat.\u201d Raw \u201ctocino\u201d poultry products with added solutions are required to be labeled in accordance with 9 CFR 381.117(h), e.g., \u201cSliced Tocino Cured Marinated Chicken Thigh Meat with 8% solution of water, sugar, salt, and spices.\u201d TOCOPHEROL: May be listed as \u201cTopcopherol (Vitamin E)\u201d on the label but not \u201cVitamin E (Tocopherol).\u201d Tocopherol and Vitamin E are not synonyms. Also, acceptable in rendered or unrendered fat. TOMATO AND BACON SPREAD: Product must contain at least 25 percent cooked bacon.", "TONGUE TRIMMINGS: Labeling terminology for the various kinds of tongue and cheek trimmings shall be as follows: 1. \u201c(Species) tongue trimmings\u201d shall be used to identify all tissues except cartilage and bone that are obtained by converting long-cut to short-cut tongues. This conversion is done by making a transverse cut anterior to the epiglottis, removing the soft palate and epiglottis, and cutting through the hyoid bone. Approximately 1 1/2 inches of the bone is left with the tongue. \u201c(Species) tongue trimmings\u201d may also be used to identify salivary glands, lymph nodes, and fat from which the muscle tissue has not been removed. 2. \u201c(Species) salivary glands, lymph nodes, and fat (tongue)\u201d must be preceded by the name of the species from which derived. Tongue meat should not include any tissues described in paragraph 2. 3. Trimmings from the tongue itself should be identified as \u201ctongue meat\u201d preceded by the name of the species from which derived. Tongue meat should not include any tissues described in paragraphs 2 and 3 above. 4. Trimmings with fat from tongue is acceptable ingredient in cooked sausage products covered under section 9 CFR 319.180 of the regulations. Lymph nodes and salivary glands are not acceptable ingredients. TOPPING -(Species) or (Kind): Topping is an acceptable product name for a nonspecific product containing the species or kind indicated as well as various other ingredients. The ingredients statement must follow the product name. See: Pizza Topping Mix TORTELLINI WITH MEAT: Product must contain at least 10 percent meat. TORTILLA WITH MEAT: Product must contain at least 10 percent meat. Tortilla is a thin, flat unleavened masa cake which is baked on both sides. TOSTADA WITH MEAT: Product must contain at least 15 percent meat. A tortilla is usually topped with refried beans, meat, cheese, and fresh vegetables.", "TOURISTEN WURST: A semi-dry type of sausage. The MPR must not exceed is 3.7:1. \u201cTROPIC CURE\u201d PORK PRODUCTS: Pork products when ready for shipment from the official establishment must have a moisture protein ratio not in excess of 3.25:1, and a salt content not less than 6 percent. TRUFFLES: Meat food product, e.g., \u201cLiver Pate with Truffles\u201d or \u201cSandwich Spread with Truffles\u201d would be expected to be prepared with at the least 3 percent truffles. Labels of product

containing less than 3 percent truffles should indicate the amount of truffle content in the name, e.g., \u201cLiver Pate with 2 percent truffles.\u201d If the name does not feature truffles and they are mentioned only in the list of ingredients, we have no minimum requirement, provided the illustration does not show truffles. TURKEY BRAUNSCHWEIGER: The product name must be shown on the label as \u201cTurkey Liver Sausage.\u201d No byproducts other than liver are permitted in the product. TURKEY CHOPS: Turkey chops are prepared by cutting the frozen breast into slabs with each cut being made perpendicular to the long axis of the keel bone (sternum). The larger slabs are split in half through the center of the sternum, resulting in two individual servings of meat with a piece of bone on one side and a thin layer of skin on the other. The smaller pieces at each end of the breast are left intact as individual servings. The word steak is unsuitable because a turkey steak is boneless by definition. TURKEY HAM PRODUCTS CONTAINING ADDED WATER: Product otherwise conforming to the standard for turkey ham under section 9 CFR 381.171 of the poultry products inspection regulations but weighing more than the original weight of the turkey thigh meat used prior to curing shall be descriptively labeled as follows: 1. The product name must include in addition to \u201cTurkey Ham\u201d, words that specify the amount of the additional substances, e.g., \u201cand percent Water,\u201d \u201cWith percent Water Added,\u201d or \u201cTurkey Ham and Water Product percent of Weight is Added Ingredients.\u201d (The ingredients of the added solution may be incorporated into the product name, e.g., \u201cTurkey Ham and Water Product percent of Weight is Added Water, Salt, Dextrose, Sodium Phosphate, and Sodium Nitrite.\u201d) The blank is filled", "in with the percent determined by subtracting the original weight of the turkey thigh meat from the weight of the cooked finished product. \u201cTurkey Ham and 12 percent Water\u201d is an example. 2. In retail and non-retail size packaging, the qualifying statements described in 1 above must be shown in lettering that is either not less than three-eighths inch in height or is at least one-third the size of the letters used in the product name and in the same color and style and on the same background as the product name. Full length of the product labeling is not required. 3. The \u201cTurkey Ham\u201d portion of the product name must be qualified with the statement \u201cCured Turkey Thigh Meat\u201d in the manner described in 9 CFR 381.171(e). This may be effected by using an asterisk as long as there is no type or other designs between the total product name and the qualifying statement. Other means of qualifying \u201cTurkey Ham\u201d will be evaluated based on clarity. Alternatively, the total name as described in 1 and 2 above may be qualified with a statement that includes \u201cCured Turkey Thigh Meat\u201d and the amount of added water, e.g., \u201cCured Turkey Thigh Meat and 12 percent Water.\u201d The statement should be presented in the manner described in 9 CFR 381.171(e). 4. The product name shall be further qualified with the statement(s) required by section 9 CFR 381.171(f) and any other statements required in Part 381. A product complying with the standard for Turkey Ham, containing added water, and descriptively labeled as stated above, must be produced under a Partial Quality Control (PQC) program approved by the Processed Products Inspection Division (PPID) prior to the use of the approved label. See: Policy Memo 057A dated September 16, 1985 TURKEY HAM AND WATER PRODUCTS CONTAINING BINDERS: Turkey ham products containing added water and binders must be labeled as \u201cTurkey Ham and Water Products\u201d X percent of weight is added ingredients as described in Policy Memo 057a to provide freeze\thaw stability and reduce

purge in packages. The binders that are acceptable for use in cured pork product can be used in these turkey ham products. The binders must be used in accordance with 9 CFR, Sections 9 CFR 319.104 (d) and 424.21 (c). Where several limits are listed, depending upon the cured pork product, the maximum amount permitted in the regulation is acceptable.

**TURKEY HAM**

**PRODUCTS CONTAINING GROUND TURKEY THIGH MEAT (LABELING):** Small amounts of ground turkey thigh meat may be added as a binder in turkey ham products as defined in 9 CFR 381.171 without declaration, provided the ground turkey thigh meat is made from trimmings that are removed from the turkey thighs during the boning and trimming process. The amount of ground turkey thigh meat that may be used", "can represent no more than the amount that was trimmed and in no case more than 15 percent of the weight of the turkey thigh meat ingredients when formulated. Products containing any ground turkey thigh meat not removed during the boning and trimming processes or products containing more than 15 percent ground turkey thigh meat must be labeled to indicate the presence of the ground turkey thigh meat, e.g., \u201ca portion of ground turkey thigh meat added.\u201d The provision in the regulations (9 CFR 381.171(f)) regarding the required use of terminology, e.g., \u201cChunked and Formed,\u201d \u201cChopped and Formed,\u201d and \u201cGround and Formed\u201d will continue to be followed. See: Policy Memo 059 dated March 29, 1983

**TURKEY LOAF: CURED, CHOPPED, (CANNED):** May contain seasonings, cures, and no more than 3 percent water at formulation. Binders and extenders are not permitted.

**TURNOVERS:** Product must contain 25 percent meat or 14 percent poultry meat. Similar to pies except the dough is folded. Cheese may be substituted for meat or poultry meat in an amount not to exceed 50 percent under the conditions outlined below: 1. Cheese must be part of the product name, e.g., \u201cBeef and Cheese Turnover\u201d or \u201cChicken and Cheese Turnover.\u201d 2. Imitation Cheese, substitute cheese, cheese food, and cheese spreads are not acceptable replacements for cheese.

**TZIMMES:** The true product name is \u201cBeef and Vegetables\u201d (or similar wording) when at least 50 percent beef is present in the product. \u201cVegetables with Beef\u201d (or similar wording) is acceptable when at least 35 percent raw beef is used.

**UKRAINIAN SAUSAGE:** A dry sausage made from lean pork and\veal chunks, containing large amounts of garlic which dominates the flavor. It is cooked and smoked at high temperatures and then air dried. The water activity (Aw) of the finished product shall not exceed 0.92 or a moisture\protein ratio 2.0:1 or less.", "VARIETY MEATS IN FRANKS: Cooked sausages with variety meats (byproducts) identified in 9 CFR 319.180(b) must contain not less than 15 percent red skeletal meat based on total meat block weight. The meat block includes meat, meat by-products, and if applicable, poultry.

**VARIETY PACKS -HORS D'OEUVRES:** Whenever FDA regulated products are included as a part of a variety pack bearing the legend (e.g., seafood hors d'oeuvres included with meat and poultry hors d'oeuvres), the labeling information must still be reviewed to assure accuracy. FDA regulated products that are found mislabeled should be corrected according to the policies of the FDA before the label can be approved.

**VEAL AND PEPPERS IN SAUCE:** Product must contain at least 30 percent cooked veal.

**VEAL BIRDS:** Product is similar to a turnover made with meat and no more than 40 percent stuffing. Categories of products are as follows: 1. Veal Birds -At least 60 percent veal 2. Veal Birds Beef Added -At least 60 percent veal and beef of which 20 percent may be beef 3. Veal and Beef Birds -At least 60 percent veal and beef of which up to 50 percent may be beef 4. Veal Birds (made from patties) -Birds made from patties shall bear a true product name descriptive

of patty used, e.g., "Veal Birds made with Veal Patties -Beef Added." The patty portion shall contain 70 percent meat. VEAL CORDON BLEU (FR): The standard requires at least: 1. 60 percent veal; 2. 5 percent ham, Canadian bacon, or cooked cured pork loin; and 3. Cheese (either Swiss, Gruyere, Mozzarella, or Pasteurized Processed Swiss)". "If the product is breaded, it must be shown in the product name. When the product is made with other than solid pieces of meat, "Chopped and Formed" must be shown contiguous to the product name. Beef is not permitted in this product. Veal that has been injected with water and phosphates and used for Veal Cordon Bleu should be labeled "Veal Roll Cordon Bleu" or other descriptive names as appropriate. VEAL DRUMSTICK, BREADED: May not contain more than 15 percent water or more than 10 percent extenders. VEAL FRICASSEE: Must contain at least 40 percent meat. VEAL PARMIGIANA: The following categories of products exist: 1. "Breaded Veal Parmigiana" is the product name for a solid piece of veal that is breaded and topped with cheese and tomato sauce. Breaded cooked veal must represent 40 percent of the finished product. 2. "Breaded Veal Parmigiana, Chopped and Formed Beef (or Beef Fat) Added" is the product name for chopped veal with up to 20 percent beef and/or beef fat added that is formed, breaded, and topped with cheese and tomato sauce. The chopped and formed beef added statement is shown one-third the size of "Veal" contiguous to the product name. Breaded cooked patty must represent 40 percent of the finished product. 3. "Breaded Veal Parmigiana made with Veal Patties, Beef (or Beef Fat) Added" is the product name for a veal patty containing at least 70 percent fresh meat (in unbreaded patty) of which 20 percent may be beef or beef fat. The patty is breaded, topped with cheese and tomato sauce. The entire qualifying statement in the product name is to be shown 1/3 size of "Veal" contiguous to product name. The breaded cooked patty represents 40 percent of the finished product. 4. Breaded Veal and Beef Patty Parmigiana. The patty may be prepared in proportions as governed by 9 CFR 317.2(f)(1)(v) of the regulations; the minimum meat patty requirement is 50 percent. If the product is breaded, the name must reflect this fact. The cheese component of the product does not have to be shown in the name of the product. A specific kind of cheese is not required, although Romano, Mozzarella, and Parmesan are the usual types used. No specific spelling of the word "Parmigiana" is required. Name applies to a "Cooked Product Assembled, Ready to Heat and Eat." The labeling of Veal Parmigiana made from a veal patty shall include veal patty in the product name, e.g., "Breaded Veal Parmigiana made with Veal Patties" or "Breaded Veal", "Patty Parmigiana." The ingredients of the veal patty do not have to be part of the product name. See: Policy Memo 092 dated December 16, 1985 VEAL PATTIES: Up to 20 percent beef and/or beef fat of the meat block permitted. Beef and/or beef fat must show in the true product name, e.g., "Veal Patties, beef added" or "Veal Patties, beef fat added." Beef and/or beef fat in excess of 20 percent of the meat block must show as "Veal and Beef Fat Patties." VEAL SCALOPPINI: Veal and sauce type product that must contain at least 35 percent cooked sliced veal. VEGETABLE DECLARATION ON LABELS: 1. The use of the terms onion, garlic, celery, and parsley shall mean fresh, frozen, or canned. 2. Processed onion or garlic must be qualified in a manner, e.g., "dried" or "dehydrated onion" or may be shown as "onion flakes" or "powdered." 3. It is usually not necessary to show vegetables as whole, diced, sliced, granulated, powdered, or pureed; however, whenever the name of the vegetable is

necessary to describe a food, then the name of the vegetable should be modified to show the form of its degree of processing. 4. Onion or garlic juice to which water has been added shall be noted, e.g., onion juice with water added. 5. Celery seed may be listed as a spice. 6. Celery salt shall be shown as celery salt. 7. Oil of celery may be listed as a flavoring. VEGETABLE EXTRACT: The source must be identified i.e. \u201csoy,\u201d \u201ccorn\u201d and \u201cbeet.\u201d

VEGETABLE GUM: Declare common or usual name of each vegetable gum, e.g., Guar Gum.", "VEGETABLE PIE WITH: \u201cSpecies\u201d meat must contain 12 percent meat on a raw basis. \u201cKind\u201d poultry must contain 7 percent cooked poultry.

VEGETABLE STEW WITH: MINIMUM MEAT CONTENT Meatballs 12 percent meat Meat 12 percent meat Meat Sauce or Gravy 6 percent meat Sauce and Meat 12 percent meat Poultry 6 percent cooked poultry meat VIENNA SAUSAGE -PACKED IN BEEF BROTH: Product must contain 80 percent sausage to be in compliance prior to inclusion in can. Broth component to have a MPR of not more than 135:1. A manufacturer holds trademark rights to the terms \u201cVienna\u201d and \u201cVienna Beef.\u201d

VINEGAR: Product must contain at least 4 grams of acetic acid per 100 cubic centimeters (approximately 4 percent acetic acid). This strength is referred to as 40 grain vinegar. Cider vinegar, which during the course of manufacture has developed an excess of acetic acid over 4 percent, may be reduced to a strength not less 4 percent. Cider vinegar so reduced is not regarded as adulterated but must be labeled as to its nature as \u201cdiluted\u201d or \u201cwater added\u201d cider vinegar. However, when vinegar of any concentration (not less than 4 percent acetic acid) is used in a food product, the only labeling requirement is \u201cvinegar.\u201d Statements like \u201cdiluted\u201d or \u201cwater added\u201d are not required.

VINEGAR PICKLE: Sausage in vinegar pickle is approved with the understanding that sausage is completely covered with pickle and that the pickle has a pH level not higher than 4.5.

WATER BASE SOLUTIONS IN RED MEAT IN MEAT PRODUCTS: Many raw red meat products with added solutions are required to be labeled in accordance with 9 CFR 317.2(e)(2) to indicate the addition of a solution has taken place, for example, \u201cBeef Containing 6% of a Solution of water, teriyaki sauce, and spices.\u201d As explained below, these requirements do not apply to except for cured red meat products that meet a standard of identity in 9 CFR 319.100-105. See the Final Rule Descriptive Designation for Raw Meat and Poultry Products Containing Added Solutions (79 FR 79044; Dec. 31, 2014). In situations where a raw product\u2019s surface is coated by rubbing, spraying, or dipping water mixed with seasonings, flavorings, etc., onto the surface of the meat, the qualifying statement describing this treatment does not have to include the percentage of solution. If, "however, these components are incorporated into the raw product by excessive rubbing, massaging, or tumbling, a descriptive designation indicating the composition and the amount of any solution absorbed is needed in accordance with 9 CFR 317.2(e)(2). Since the regulations (9 CFR 319.101 and 102) allow uncooked corned beef brisket to contain 20 percent of a curing solution, and uncooked corned beef round and other cuts to contain 10 percent of a curing solution above the weight of the fresh, uncured (green weight) product without disclosure, 9 CFR 317.2(e)(2) would not apply unless the product does not meet the standard of identity in accordance with 9 CFR 317.2(e)(2). 9 CFR 317.2(e)(2) does not apply to uncooked cured pork products that are labeled and manufactured in accordance with the standards of identity for cured pork products in (9 CFR 319.104 and 105) If the product does not meet these standards then it is required to be labeled in accordance with 9 CFR 317.2(e)(2). However, 9 CFR 317.2(e)(2) would apply to

uncooked cured pork trimmings or uncooked cured pork products that contain added solutions that are not labeled and manufactured in accordance with or are not subject to a standard of identity for cured pork products, such as hams, loins, shoulders, butts, picnic, hocks, jowls, etc. The addition of an enzyme solution to meat products is limited to 3 percent of the raw meat product (green weight) by the meat inspection regulations (9 CFR 424.21). If a product is treated with an enzyme solution and a flavoring solution, separately or in one step, both treatments are required to be identified on the label. The label must contain a descriptive designation indicating the percent flavoring solution, and a product name qualifier, such as \u201cTenderized with Papain\u201d in accordance with 9 CFR 317.8(b)(25). In this case, product qualifying statements should not intervene between the product name and the descriptive designation for the solution. Alternately, the descriptive designation and the product qualifying statement may be combined into one statement. For example, an acceptable name for raw beef pumped with 10% solution that contains papain could be \u201cbeef contains up to 7% tenderizing and seasoning solution of water, teriyaki sauce, spices, and papain.\u201d For uncooked products, the percent added solution for the label statement is determined by subtracting the fresh (green) weight of the article from the weight of the finished (total) product that is, after injecting, marinating, etc., dividing by the weight of the fresh article, and multiplying by 100. Cooked red meat products containing added solutions are addressed in Policy Memo 084A WATER-DECLARATION: The use of water must be declared in the ingredients statement of all products with the exception of the following: 1. The water added to lactic acid starter culture (.05 percent or less) for the purpose of rehydration. 2. The water added to products which are freeze-dried or sprayed-dried. WATER IN CANNED SAUSAGE:,"Water, not to exceed 8 percent of the total product weight, may be used in the preparation of precooked pork sausage links intended for canning. The amount of water used is for the purpose of replacing that which is lost during the processing operation that takes place prior to canning. The weight of the sausage at the time of canning shall not exceed the weight of the fresh uncured meat ingredients plus the weight of the curing ingredients and the seasoning ingredients. WATER-MISTED AND ICE-GLAZED MEAT AND POULTRY PRODUCTS: When meat or poultry products are water-misted or ice-glazed, the net weight of the product may not include the weight of the water or ice. An acknowledgment to this effect must be indicated on the label application form. A prominent and conspicuous statement must appear on the principal display panel adjacent to the product name, describing that the product is protected with a water-mist or ice glaze (e.g., \u201cProduct Protected with Ice Glaze\u201d).","If the manufacturer can show that a water or ice glaze is sublimed from the unpackaged product during freezing so as not to compromise the integrity of the product's formulation or the standard with which it must comply, the labeling of the product need not bear the statements identified above. Because the regulatory standard 9 CFR 319.15 precludes the addition of water -hamburger, ground beef and chopped beef patties cannot be ice-glazed and, if there is evidence of an ice-glaze on such patties subsequent to freezing, they must be labeled appropriately to be sold in commerce, e.g., as \u201cbeef patties.\u201d However, water-misting of formed hamburger, ground beef, or chopped beef patties just prior to freezing individual patties is permitted if (1) the water applied in misting acts as a processing aid to prevent shrinkage of the patties, and (2) the misted water sublimes from the surface of the patties during the freezing process such that the weight of the patty exiting the freezer does

not exceed the green weight of the patty just prior to water-misting and freezing. See: Policy Memo 108B dated June 24, 1993 WEISSWURST: A name for uncured sausage usually made of pork or veal. It is of German origin and means white sausage. The color of the sausage after cooking is white because of the lack of cure and the type of meat used. Weisswurst is similar to Bratwurst. When milk or milk and eggs are added to a Weisswurst batch, it should be labeled as \u201cKalbsbratwurst\u201d or \u201cBockwurst\u201d respectively. WELSH RAREBIT SAUCE WITH COOKED HAM: Product must contain at least 20 percent cooked ham in the total formulation. WHEAT GLUTEN: Acceptable for use to bind fresh meat cuts, e.g., boneless loins, boneless legs, and livers together, so that they may be cooked and sliced without falling apart. The amount used should not exceed 2 percent of the weight of the total product. The product name shall be qualified by the phrase \u201cWheat Gluten Added.\u201d Wheat gluten is not acceptable for use with chunked and\or chopped specific products as roasts, rolls, and reformed meat cuts. Acceptable in nonspecific products and home-style meat loaves within the prescribed limits of other extenders and binders.", "WHOLE HOG SAUSAGE: Must contain all primal parts of a hog. Hearts and tongues, in natural proportions, are permitted ingredients in whole hog sausage when declared in the ingredients statement. Other meat byproducts are not permitted in whole hog sausage. See: 9 CFR 319.144 WIENER SCHNITZEL (GR): A veal cutlet prepared by dipping in egg, flour, and bread crumbs and frying to a golden brown. WILD BOAR: Products prepared from wild boar from feral swine are amenable and subject to the meat inspection regulations. \u201cWild Boar\u201d is an acceptable label term for a product, provided the words \u201cWild Boar\u201d are directly followed by the statement \u201cMeat from Feral Swine.\u201d The statement \u201cMeat from Feral Swine\u201d must appear prominently on the principle display panel as described in 9 CFR 317.2(d)(1)(2) and (3). If the statement \u201cMeat from Feral Swine\u201d does not directly follow the term \u201cWild Boar,\u201d then an asterisk may be included with the term \u201cWild Boar\u201d and the statement \u201cMeat from Feral Swine\u201d should appear prominently elsewhere on the principal display panel. \u201cWild Boar from Feral Swine,\u201d \u201cWild Boar Meat from Feral Swine,\u201d \u201cWild Boar (byproduct) from Feral Swine,\u201d are also acceptable product names. In order to obtain approval for a product label bearing the name \u201cWild Boar from Feral Swine,\u201d or similar acceptable names, a statement describing and verifying the following physical and environmental characteristics typical of wild boar is required: color patterns, e.g., white stripes or spots, longer bristly haircoat, elongated snout with visible tusks, a \u201crazorback\u201d body shape, and wild boar males which are uncastrated. (We acknowledge both males and females under the term \u201cWild Boar.\u201d) The purchased hogs should be obtained from a nonrestrictive environment which permits foraging for uncultivated feed, natural selection, and breeding and farrowing without confinement. A letter should be submitted with \u201cWild Boar from Feral Swine\u201d labels describing the environment where such swine live and their method of capture or entrapment. These same criteria would also apply to imported \u201cWild Boar Meat from Feral Swine\u201d and arrangements should be made through Foreign Programs for slaughter and export from approved establishments. In multi-ingredient products, e.g., \u201cBeans in Sauce with Wild Boar,\u201d the \u201cWild Boar\u201d part of the product name must be followed by an asterisk and a statement \u201c(Meat or meat byproduct) from Feral Swine\u201d must appear somewhere on the principal display panel. The ingredient wild

boar, wild boar meat, or wild boar byproduct, must be listed as "\u201cWild","Boar ((Meat or meat byproduct) From Feral Swine)\u201d in the ingredients statement in its proper order of predominance. See: Policy Memo 097 dated June 4, 1986 WING SECTIONS: First wing section is described as the wing drummette Second wing section is described as the wing portion Wings Sections is an acceptable wing term for both wing drummette and wing portion when in natural proportions. WITH NATURAL JUICES (POULTRY): The term "\u201cWith Natural Juices\u201d may be used with poultry products to indicate the presence of cooked out juices derived solely from the liquid normally associated with the poultry prior to cooking. If liquids have been added to the poultry prior to cooking, natural can not be used. WRAPS: A ready-to-eat meat\poultry food product that may contain vegetables and seasoning ingredients and is wrapped in a dough based component, e.g., tortilla. The product name must bear the kind or species, e.g., "\u201cHam Wraps.\u201d The minimum meat or poultry requirement is 2 percent cooked meat or 2 percent cooked poultry meat. YEARLING: The term "\u201cyearling\u201d (e.g. yearling beef) may be used to describe an animal of either sex that is too old to be classified as a calf or lamb but less than 2 years of age. The company is required to segregate carcasses and provide product identification to insure that no commingling occurs between qualifying and nonqualifying products. The terms "\u201cYearling Ovine\u201d, "\u201cYearling Mutton\u201d and "\u201cYearling Sheep Meat\u201d are acceptable product names for meat derived from sheep between 1 and 2 years of age. Yearling Lamb is not an acceptable name for this product. YEAST: 1. Dried Brewers Yeast: Acceptable ingredient of meat food products. 2. Autolyzed Yeast Extract: (Dehydrate of Paste form) Autolyzed yeast extract is not considered an artificial flavoring. Its presence should be reflected in the statement of ingredients as "\u201cautolyzed yeast extract.\u201d", "See: 9 CFR 317.2(f)(l)(i) 9 CFR 317.8(b)(7) 9 CFR 424.21 9 CFR 381.118(c) 9 CFR 381.147(f)(4) YIELD GRADES: When using specific grades for beef and pork cuts, the yield grade numbers must be identified based on the boxed product. Therefore, yield grades such as 2 or higher, are not acceptable."],{"file\_name":"FSIS\_GD\_2003\_0001","title":"Guidance on the Elimination of the Pizza with Meat or Sausage Standard Q & A's","num":"FSIS-GD-2003-0001","id":"01e1002888c5f3a50c7cc77c34762942baa1eb9a0853f2f67b1607ef52ffe964","corp\_us":"fsis\_guidelines","source\_page\_url":"https://www.fsis.usda.gov/policy/fsis-guidelines","url":"https://www.fsis.usda.gov/sites/default/files/media\_file/2021-07/FSIS-GD-2003-0001.pdf","type":"pdf","n\_pages":10,"word\_count":3346,"text\_by\_page":["Water Reuse Questions and Answers (Q&As) INTRODUCTION Water use in many federally inspected meat and poultry establishments is extensive. In an attempt to conserve this valuable natural resource, it can be appropriate in certain circumstances to reuse water. In all instances where reused water is employed, it is important to emphasize the primacy of ensuring that the water that is being reused is safe for its intended purpose. FSIS encourages the development of water reuse technologies in federally inspected establishments. However, food safety cannot be compromised by the use of such technologies. The source of the water, the measures taken to recondition the water, and the intended reuse application must be taken into consideration by an establishment when determining whether food safety hazards exist. Establishments are responsible to ensure that water is reused in a way that will not result in the adulteration of product or the creation of insanitary conditions. If an establishment reuses water, FSIS expects that the establishment will consider the effects of water reuse in its hazard analysis, and

support and document all decisions that it makes associated with the reuse. Establishments are expected to consider whether reusing water will create physical, chemical, or biological hazards, and whether additional measures are necessary to ensure that product is neither contaminated nor adulterated. Inspection personnel verify that the regulatory requirements are met, including that sanitary conditions are maintained. The regulatory requirements for water reuse are listed in 9 CFR 416.2(g). FSIS has issued the Sanitation Performance Standards Compliance Guide (found at <http://www.fsis.usda.gov/oppde/rdad/frpubs/sanitationcover.htm>) which provides indepth guidance on how an establishment may meet the sanitation regulatory requirements with respect to specific water reuse applications. Compliance Guidelines are not regulatory requirements but are intended to suggest means by which compliance with the above regulatory requirements can be achieved. This Q&A document addresses the reuse of water, ice, and solutions that come into contact with product, equipment, or other surfaces and that are used again for the same or other purpose within the limits of 9 CFR 416.2(g). FSIS developed this Q&A document in response to numerous inquiries sent to the Technical Service Center regarding water reuse and the interpretation of the underlying regulations. The questions presented are representative of those that FSIS has received. A list of applicable regulations is included as Attachment 1 at the end of the Q&A\u2019s."

1. Question: Does an establishment that intends to reuse water in accordance with 9 CFR 416.2(g) need to have its program reviewed by the Agency prior to implementation? Answer: No. FSIS does not prior-approve the food safety control system used by an establishment. However, FSIS expects the establishment to fully consider the physical, chemical, and microbiological consequences of the reuse of water in its hazard analysis and to support all decisions it makes with respect to water reuse. As appropriate, the establishment will need to address the effects of water reuse in its HACCP plan or Sanitation SOP or other prerequisite program.

2. Question: All city water has to comply with the Environmental Protection Agency (EPA) National Primary Drinking Water regulations. If an establishment uses a municipal water supply, is a city water bill acceptable documentation that the water meets the EPA requirements? Answer: No. A water report attesting to or certifying the potability of the municipal water supply, issued by the responsible State or local agency, is required because such documentation directly addresses the regulatory requirement. Water supply requirements are covered in the sanitation regulations in 9 CFR 416.2 (g)(1). These requirements are also addressed in FSIS Directive 5000.1, Revision 1, Amendment 1. It is the responsibility of the establishment to ensure that plumbing systems provide an adequate supply of potable water for processing and other purposes without adulterating product or creating insanitary conditions.

3. Question: If an establishment purchases ice from a local store, can this ice be used to cool product? Answer: Yes, provided that the ice meets the same standards as potable water in that documentation is made available to attest to or certify that the ice is made from potable water. If the plant uses ice purchased from a local store, a water report indicating potability must be on file from the manufacturer of the ice to show that the water used to make the ice is potable. If the ice was made from a private well, documentation indicating the potability of the water supply used to make it must also be on file and renewed at least semi-annually. If water potability documentation from the manufacturer of the ice is not on file, then there is noncompliance with 9 CFR 416.2(g)(6) which states: \u201cWater that does not meet the use conditions of paragraph (g)(1) through (g)(5) of this section may not be

used in areas where edible product is handled or prepared or in any manner that would allow it to adulterate edible product or create insanitary conditions.\u201d 4. Question: Is a facility operating under 9 CFR Part 350 (Identification Service, Food Inspection Service or Certification Service) required to maintain water potability documentation on file?", "Answer: Yes. Facilities operating under 9 CFR Part 350 are required to meet all parts of 9 CFR 416.1 through 416.6. A supply of running water that complies with the EPA National Primary Drinking Water regulations (40 CFR part 141), at a suitable temperature and under pressure as needed, must be provided in all areas where required (for processing product, for cleaning rooms and equipment, utensils, and packaging materials, for employee sanitary facilities, etc.). If a facility uses a municipal water supply, it must make available to FSIS, a water report certifying or attesting to the potability of the water supply. If an establishment uses a private well for its water supply, it must make available to FSIS documentation certifying the potability of the water supply that has been renewed at least semi-annually. 5. Question: Can a brine solution used to cool fully cooked comminuted sausage products be reused for the same purpose (i.e., to cool subsequent production of fully cooked comminuted sausage)? Answer: Yes, in accordance with 9 CFR section 416.2(g)(2), it may be reused provided that it is maintained free of pathogenic organisms and fecal coliform organisms, and that other physical, chemical, and microbiological contamination has been reduced to prevent adulteration of product. 6. Question: In 9 CFR 416.2(g) (2) and (3), the regulations state that water may be reused for the same purpose. What does \u201cfor the same purpose\u201d mean? Answer: \u201cFor the same purpose\u201d as used in 9 CFR 416.2(g)(2) and(3) means that water used to cook or chill ready-to-eat products could be reused to cook or chill subsequent production of ready-to-eat products, and that water used to chill or wash raw product could be reused to chill or wash raw subsequent production of raw products. It would not be acceptable to reuse water that has contacted raw product for RTE product because of the increased likelihood that such water would contain pathogens and other contaminants that would be transfer from raw to cooked product. Under 9 CFR 417.2(a) an establishment should consider the effects of the reuse in its hazard analysis and support all decisions made in the hazard analysis associated with the reuse. The establishment must ensure that the reuse water is safe for its intended purpose by taking measures, as appropriate, to reduce contamination when deemed necessary by its hazard analysis. 7. Question: The Sanitation Performance Standards Compliance Guide lists requirements for turbidity. Does the reuse water need to meet the turbidity requirements of less than 5 NTU for cook and chill water reuse as indicated in the Compliance Guide? Answer: No, turbidity is not a required criterion for water reuse. However, turbidity is a measure of the water\u2019s relative clarity with regard to contaminants that may have been incorporated into the water as a consequence of reuse or inadequate water treatment. The Sanitation Performance Standards Compliance Guide contains guidelines that could be used by an establishment to meet water reuse regulations, but these are not in", "themselves regulatory requirements. An establishment needs to consider the impact that increased turbidity would have on water quality and address it in its hazard analysis. 8. Question: Must poultry chiller water that is intended for reuse whereby it is chilled via heat exchangers and returned to the poultry chiller comply with the water reuse requirements in 9 CFR 416.2(g)(3)? Answer: Yes. When poultry chiller water is chilled via heat exchangers and returned to the chiller, it is being reused for the same purpose and must comply with the requirements of 9 CFR 416.2(g)(3). This

section of the regulation requires that establishments take measures to reduce contamination in the water, as necessary, to prevent contamination or adulteration of product. To comply, an establishment must consider the effects of reusing the water in the hazard analysis and support all decisions made regarding this reuse. Depending on the results of the hazard analysis, establishments are expected to take the measures necessary to ensure that their products are not contaminated or adulterated. Failure to consider the effects of reusing water within the chill system would raise concerns about the adequacy of an establishment's hazard analysis.

9. Question: Are there specific test requirements or quantitative reductions that must be met to demonstrate compliance with 9 CFR 416.2(g)(3)? Answer: No. Section 416.2(g)(3) does not dictate what measures need to be taken, only that measures be taken to reduce physical, chemical, and microbiological contamination so as to prevent contamination or adulteration of product. The extent of reconditioning is dependent on the source of the water and the specific reuse application. Each situation should be considered in the hazard analysis for the particular process, and the necessary measures to prevent contamination or adulteration of product should be identified.

10. Question: What are examples of measures to reduce physical, chemical, and microbiological contamination?

Answer: These measures could include methods used by the establishment to lower the level of contaminants in the reuse water that is to be reused when the establishment's hazard analysis determines that a reduction in physical, chemical, and microbiological contamination is necessary. Listed below are some examples of specific methods that an establishment may consider when needing to lower contamination levels:

- Filtration -- There are many different types of filters available to industry to address physical contamination, from simple cloth and sand filters to elaborate, patented technologies designed to remove extremely small sized contaminants. Specially designed filtration systems may also effectively reduce the build-up of chemical contamination.
- Antimicrobials -- Examples of measures to reduce microbiological contamination are the addition of antimicrobials, the use of ultraviolet light, or ozonation.

"11. Question: Can reuse water be used to rinse equipment on a poultry evisceration line? Answer: Yes, provided that the provisions of 9 CFR 416.2(g)(3) and (4), where applicable, are properly addressed. Regulation 9 CFR 416.2(g)(3) requires that the establishment take steps to reduce physical, chemical, and microbiological contamination so as to prevent contamination or adulteration of product. Regulation 9 CFR 416.2(g)(4) addresses water derived from an advanced wastewater treatment facility and also requires that after use of such water, a final rinse with non-reconditioned potable water must be performed.

12. Question: Can water that has been reconditioned by an onsite advanced wastewater treatment facility be used on or in ready-to-eat (RTE) product? Answer: No. Water reconditioned by an onsite advanced wastewater treatment facility may not be used in product formulation or in/on RTE product. Reconditioned water that has never contained human waste may be used on raw product provided it is followed by a separate final rinse with non-reconditioned potable water.

13. Question: Does reuse water that is to be used to wash antemortem pens or poultry cages need to be pathogen free as stated in 9 CFR 416.2(g)(5)? Answer: Yes, the Agency is concerned that there is the potential for the transfer of pathogenic organisms, such as *Salmonella* from contaminated poultry cages or antemortem pens to poultry or livestock that were previously free of them. The Agency is also concerned about the potential to create insanitary conditions and to expose plant employees and inspection personnel to pathogens.

when reuse water that has not been shown to be pathogen free is used for the initial cleaning of antemortem pens, poultry cages, and livestock vehicles. 14. Question: If a poultry establishment wishes to reuse water to float feathers in the picking area under the pickers, must that reuse water be free of pathogenic organisms? Answer: No. The Agency has determined that the reuse of water that may contain pathogens is acceptable for certain uses and under certain conditions. For example, the reuse of poultry chill water overflow to move feathers out of the picking area or to move solid wastes down the evisceration troughs for disposal are situations where it is acceptable under 416.2(g)(6) to reuse water that may contain pathogens. Evisceration troughs and floor drains are inedible areas separated from edible areas by space. The establishment is responsible to ensure that this is done in a sanitary manner and that it will not contaminate product or product contact surfaces or result in the adulteration of product. Establishments are required to consider the effects of the water reuse in the hazard analysis and support all decisions made regarding this reuse." "Attachment 1: 9 CFR 416.2(g)

416.2(g)(1) A supply of running water that complies with the National Primary Drinking Water regulations (40 CFR part 141), at a suitable temperature and under pressure as needed, must be provided in all areas where required (for processing product, for cleaning rooms and equipment, utensils, and packaging materials, for employee sanitary facilities, etc.). If an establishment uses a municipal water supply, it must make available to FSIS, upon request, a water report, issued under the authority of the State or local health agency, certifying or attesting to the potability of the water supply. If an establishment uses a private well for its water supply, it must make available to FSIS, upon request, documentation certifying the potability of the water supply that has been renewed at least semi-annually. 416.2(g)(2) Water, ice, and solutions (such as brine, liquid smoke, or propylene glycol) used to chill or cook ready-to-eat product may be reused for the same purpose, provided that they are maintained free of pathogenic organisms and fecal coliform organisms and that other physical, chemical, and microbiological contamination have been reduced to prevent adulteration of product.

416.2(g)(3) Water, ice, and solutions used to chill or wash raw product may be reused for the same purpose provided that measures are taken to reduce physical, chemical, and microbiological contamination so as to prevent contamination or adulteration of product. Reuse that which has come into contact with raw product may not be used on ready-to-eat product. 416.2(g)(4) Reconditioned water that has never contained human waste and that has been treated by an onsite advanced wastewater treatment facility may be used on raw product, except in product formulation, and throughout the facility in edible and inedible production areas, provided that measures are taken to ensure that this water meets the criteria prescribed in paragraph (g)(1) of this section. Product, facilities, equipment, and utensils coming in contact with this water must undergo a", "separate final rinse with non-reconditioned water that meets the criteria prescribed in paragraph (g)(1) of this section. 416.2(g)(5) Any water that has never contained human waste and that is free of pathogenic organisms may be used in edible and inedible product areas, provided it does not contact edible product. For example, such reuse water may be used to move heavy solids, to flush the bottom of open evisceration troughs, or to wash antemortem areas, livestock pens, trucks, poultry cages, picker aprons, picking room floors, and similar areas within the establishment. 416.2(g)(6) Water that does not meet the use conditions of paragraphs (g)(1) through (g)(5) of this section may not be used in areas where edible product is handled or prepared or in any manner that would allow it to adulterate

edible product or create insanitary conditions."],{"file\_name":"FSIS\_GD\_2003\_0002","title":"Supplemental Pizza Q & A's","num":"FSIS-GD-2003-0002","id":"90f24ad05eede88e92adaebd93cf0078ed06956dce3fc2f4f7b60ccc1463b15","corp\_us":"fsis\_guidelines","source\_page\_url":"https:\/\/www.fsis.usda.gov\/policy\/fsis-guidelines","url":"https:\/\/www.fsis.usda.gov\/sites\/default\/files\/media\_file\/2021-07\/FSIS-GD-2003-0001-supplemental.pdf","type":"pdf","n\_pages":2,"word\_count":849,"text\_by\_page":["Guidance for Determining Whether a Poultry Slaughter or Processing Operation is Exempt from Inspection Requirements of the Poultry Products Inspection Act United States Department of Agriculture Food Safety and Inspection Service Inspection & Enforcement Initiatives Staff Revision 1, April - 2006","Table of Contents Introduction

29","Guidance for Determining Whether a Poultry Slaughter or Processing Operation is Exempt from Inspection Requirements of the Poultry Products Inspection Act Introduction An increasing number of small poultry producers, also called \u201cgrowers,\u201d are raising, slaughtering, and processing their poultry on their farms and selling the poultry directly to

customers at the farms or at farmers\u2019 markets. Some of these small producers are going further by building processing facilities with the intent of supplying local customers, including household consumers, retail stores, restaurants, boarding houses, and institutions. Other producers and businesses are building processing plants to supply poultry that meets special religious dietary requirements such as Kosher and Halaal or (Halal), and niche markets, such as organically grown poultry and live poultry markets. At some point, a grower or business that plans to or has made the decision to sell poultry that he or she slaughters or processes will face the question \u201cCan I sell the poultry that I slaughter or process, without inspection by the Federal or State government?\u201d The Food Safety and Inspection Service (FSIS) of the Department of Agriculture (USDA) created this guide to help small businesses and poultry producers who slaughter or process poultry for human food to determine whether the slaughter or processing operations at their businesses are eligible for exemption from Federal or State inspection. In other words, this guide is helpful to producers or businesses in determining whether their slaughter or processing operations require USDA or State inspection, as mandated in the Poultry Products Inspection Act (PPIA). In addition, this guidance material can serve as a quick reference for Federal and State inspection personnel who have questions about whether a poultry operation qualifies for a exemption in the PPIA. This guidance does not address exemptions related to livestock product (e.g., meat from cattle, swine, sheep, goat, and equine) because the Federal Meat Inspection Act does not provide exemptions similar to those provided in the Poultry Products Inspection Act. In addition, this guidance material does not address exemptions requirements where State Laws may be different from those in the PPIA and FSIS\USDA regulations. The 1957 Wholesome Poultry Products Act (Public Law 90 \u2013 492), which is commonly referred to as the Poultry Products Inspection Act (PPIA)<sup>1</sup> was passed by Congress to ensure that only wholesome poultry that is not 1 A copy of the Poultry Product Inspection Act can be accessed by browsing the FSIS home page at ([http://www.fsis.usda.gov/regulations\\_&\\_policies/Poultry\\_Products\\_Inspection\\_Act/index.asp](http://www.fsis.usda.gov/regulations_&_policies/Poultry_Products_Inspection_Act/index.asp)). This is the Act found in the United States Codes Sections 451-470. There are published copies of the PPIA with the sections numbered from 1to 29 that correspond to U.S. Code sections 451 to 470. 1", "adulterated and not misbranded enters interstate or foreign commerce. The 1957 Act mandated Federal inspection at businesses that slaughter poultry or process poultry products that enter interstate or foreign commerce. Congress amended the Act in 1968, extending the mandate for Federal inspection to all businesses that slaughter or process poultry for shipment within a State, when the State does not enforce requirements at least equal to the Federal inspection requirements in the PPIA. Because of this amendment, any business in any State that slaughters or processes poultry for use as human food is required to do so under Federal or State inspection, unless the slaughter or processing operations at the business meets certain exemption criteria in the Act. What does exempt mean? The term \u201cexempt\u201d means that certain types of poultry slaughter and processing operations qualify to operate without the benefit of Federal inspection on a daily basis, and a grant of Federal inspection is not required. Such operations are exempt from continuous bird-by-bird inspection and the presence of inspectors during the slaughter of poultry and processing of poultry products. However, a facility operating under such an exemption is not exempt from all requirements of the Act. It was not the intent of Congress to mandate Federal or State inspection of an owner\u2019s private holdings of poultry or to mandate inspection at

businesses that slaughter or process a small amount of poultry. Therefore, the PPIA exempts some poultry slaughter and some processing operations from certain requirements of the Act. The Act does not exempt any person slaughtering or processing poultry from the provisions requiring the manufacturing of poultry products that are not adulterated and not misbranded. Thus, all businesses slaughtering or processing poultry for use as human food, including exempt operations, must produce poultry product that is not adulterated or misbranded. How is Adulteration Defined? Both the PPIA and the supporting Federal regulations define the circumstances and conditions that would render poultry products adulterated. Simply put, a product is adulterated if it bears or contains a substance that makes it injurious to health, or if it has been held, packed or produced under insanitary conditions. The specific definitions of circumstances that define adulteration are detailed in Section 453 of the PPIA, and in Title 9 Code of Federal Regulations ( 9 CFR). In addition, the definitions have been reproduced as Attachment 5 of this document. To qualify for any one of the poultry exemptions, a business must slaughter poultry or process poultry products under sanitary conditions using procedures that produce sound, clean poultry products fit for human food. Attachment 2 of this guidance is a list of sanitary standards and procedures. These sanitation procedures and practices are required for poultry businesses receiving full USDA inspection and are applicable to exempt poultry operations [Title 9 CFR part 416]. 2", "Specific sanitary practices are described in FSIS\u2019s Sanitation Performance Standards Compliance Guide, dated October 13, 1999. The specific sanitary practices in the document are not requirements. In the Guide, FSIS presents or references methods already proven effective in maintaining sanitary conditions in meat and poultry establishments. Establishments that follow the guidance can be fairly certain that they comply with the requirements in the Act and regulations to conduct operations under sanitary standards, practices, and procedures that result in poultry products that are not adulterated. How is Misbranded Defined? The regulations require that poultry products transported or distributed in commerce bear specific information. Poultry products inspected and passed under USDA inspection at official USDA establishments must bear the official inspection legend and meet specific labeling requirements prescribed in the regulation. However, exempt poultry products cannot bear the official mark of inspection. In addition, there is specific labeling or identification requirements for exempt product to meet in lieu of bearing all required elements of a label. The information that shipping containers or packages of exempt poultry products must bear varies depending on the exemption. The specific information required on the shipping containers or packages of exempt products is presented later in discussions for each type of exemption. What is Commerce? Commerce is the exchange or transportation of poultry products between States, U.S. territories (Guam, Virgin Island of the United States, and American Samoa), and the District of Columbia [Title 9 CFR \u00a7381.1(b)]. In this document, we qualify \u201ccommerce\u201d with \u201cinterstate\u201d when referencing the exchange or transportation of poultry products between States, United States territories, and the District of Columbia. We also qualify \u201ccommerce\u201d with \u201cintrastate\u201d when referring to the exchange or transportation of poultry products solely within a State, territory, or the District of Columbia. FSIS will not view the product as having been introduced into commerce if it has not left the control of the processing entity. What is Slaughter? The term slaughter refers to the act of killing poultry for use as human food. What is Processed or Processing? The terms \u201cprocessed\u201d and \u201cprocessing\u201d refer to

operations in which the carcasses of slaughtered poultry are defeathered, eviscerated, cut-up, skinned, boned, canned, salted, stuffed, rendered, or otherwise manufactured or processed.

3", "How can I determine whether an operation qualifies for an exemption under the Poultry Products Inspection Act? Use the decision chart on the following page to determine whether a slaughter or processing operation qualifies for one of the exemptions in the PPIA and supporting regulations. Read the question in bold type in the squares and then follow the \u201cyes\u201d or \u201cno\u201d response arrows to determine the exemption, if any, under which the poultry products may be produced. When the arrows lead to an oval read the exemption criteria for the exemption on the page indicated in the oval to determine the exemption, if any, for which the slaughter or processing operation would qualify. You should contact the FSIS District Office responsible for Federal inspection or the State Agency responsible for administering a State Poultry Inspection Program in the State where your slaughter and processing is located. This contact will facilitate reviews of the operation by FSIS or the State Agency with oversight of businesses operating under an exemption in your State. Some States may have requirements in their exemption laws for a business to qualify for an exemption that differ from Federal requirements. The FSIS District Office or the State Agency will determine whether your operation qualifies for the exemption. Attachments 3 and 4 are lists of FSIS district offices for the Office of Field Operations (OFO), and FSIS regional offices of the Office of Program Evaluation Enforcement and Review (OPEER), and State contacts. The information in these lists is subject to change as is the web\url cite for, OFO and OPEER. If you slaughter or process poultry that is donated or sold for use as human food, and the operation does not qualify for an exemption from inspection, you must contact the FSIS District Office or State Office responsible for inspection in the State where your operation is located. The FSIS District Office or State Office will provide instructions and guidance on obtaining FSIS or State inspection for your poultry products. Because the poultry exemption categories are complicated, please contact a FSIS, District Office if you have any questions.

4", "5 Do you slaughter or process poultry Is the poultry you slaughter or process for your private use? consumers, restaurants, hotels and boarding houses, for use as meals in such businesses Custom Slaughter Producer\Grower \u2013 1,000 Exemption \u2013 See page 9 Small Enterprise Exemption Do you slaughter and\or exempt. Contact the e 4 and Attachment 3 Decision Flow Chart for Poultry Exemptions Under the PPIA\* Producer\ Grower \u2013 20,000 Limit Exemption","Exemptions Personal Use Exemption Mandatory inspection of the slaughter and processing of privately owned poultry is not required, provided that the following six criteria are met [PPIA Section 464(c)(1)(A), (d), & (e) \u201cSection 15 (2)(1)(A),(d) & (e)\u201d; Title 9 Code of Federal Regulations (CFR) \u00a7381.10(a)(3)]. Criteria: 1. The slaughtered and processed poultry is for the private use of the: a. grower\producer\owner, b. members of his or her household, and c. his or her nonpaying guests and employees; 2. The slaughter and processing of the poultry is performed by the grower\producer\owner; 3. The poultry is healthy when slaughtered; 4. The poultry is slaughtered and processed under sanitary conditions and practices that result in poultry products that are sound and fit for human food; 5. The exempt poultry is not sold or donated for use as human food; and 6. The shipping containers bear: a. the producer\u2019s name, b. the producer\u2019s address, and c. the statement, Exempt P.L. 90-492. \u201cExempt P.L. 90-492\" identifies the product as product produced under an exemption from the Act, Public Law 90-492. Instead of the Federal law 90-492, a State law may be cited when the inspection of the slaughter and processing of poultry is exempted under the authority of a State law and the operations are reviewed by a State Agency. Personal Use Exemption Notes: \u2022 There is no limit to the total amount of poultry that owners of poultry may slaughter and process for their private use. \u2022 If any of the six criteria are not met, the poultry is not eligible to be processed under the Personal Use Exemption. 2 Some published copies of the PPIA number the sections from 1 to 29 not 451 to 470 as numbered in the United States Codes. 6","Custom Slaughter\Processing Exemption A custom poultry slaughterer is a business or person who slaughters and processes poultry belonging to someone else. A custom slaughterer provides a service to a customer and does not engage in the business of buying or selling poultry products capable of use as human food. A custom slaughter business may slaughter or process an unlimited number of poultry when the poultry is delivered by the owner and the following five criteria are met [PPIA Section 464(c)(1)(B) \u201cSection 15 (c)(1)(B)\u201d; Title 9 CFR \u00a7381.10(a)(4) & (d)]. Criteria: 1. The custom slaughterer does not engage in the business of buying or selling poultry products capable for use as human food; 2. The poultry is healthy when slaughtered; 3. The slaughter and processing at the custom slaughter facility is conducted in accordance with sanitary standards, practices, and procedures that produce poultry products that are sound, clean, and fit for human food (not adulterated); 4. The custom slaughtered or processed poultry is for the personal use of the grower\owner of the poultry \u2013 the grower\owner of the custom slaughtered or processed poultry may not sell or donate the custom slaughtered poultry to another person or institution; and 5. The shipping containers bear: a. the owner\u2019s name, b. the owner\u2019s address, and c. the statement, \u201cExempt P.L. 90-492\u201d These three items are in lieu of all the required features of a label for inspected and passed poultry products. Also, instead of the Federal law 90-492, a State law may be cited when the inspection of the slaughter and processing of poultry is exempted under the authority of a State law, and the operations are reviewed by a State Agency. Custom Slaughter Exemption Notes: \u2022 If any of the five criteria are not met, the owner of the poultry is not eligible for this exemption. 3

Some published copies of the PPIA number the sections 1 to 29 not 451 to 470 as numbered in the United States Codes. 7", "\u2022 Selling live poultry to a customer does not disqualify a business from the Custom Slaughter Exemption. For example, a custom slaughterer may sell live poultry to a person and then custom slaughter the bird. However, a person who custom slaughters poultry may not buy or sell poultry products used for human food. \u2022 A person operating under a Custom Slaughter Exemption may slaughter and process poultry of his or her own raising provided such slaughtered poultry is for his or her exclusive consumption, or consumption by members of his or her household, nonpaying guests, and employees. \u2022 A person who is a custom slaughterer and who is also a poultry grower may raise and sell his or her live poultry to poultry businesses not associated with his or her custom slaughter business. \u2022 A custom slaughter business may use a mobile slaughter\processing unit to custom slaughter and process poultry. There is compliance with the requirements of the Act and regulations when the owner of poultry delivers poultry to a mobile slaughter\processing unit operated by a custom slaughterer provided the slaughtered or processed poultry is for the personal use of the owner of the poultry. The owner of the poultry may deliver the poultry to the mobile slaughter\processing unit located at his or her own premises or any other person\u2019s premises. \u2022 Ostrich and other poultry can be custom slaughtered and processed in an official red meat establishment that is subject to the regulatory requirements of the Federal Meat Inspection Act, provided the establishment does not engage in the business of buying and selling poultry products. Also, carcasses or parts of ostrich or poultry not slaughtered at the red meat establishment may be delivered by the owner for custom processing provided the poultry has been previously inspected, passed, and identified as such in accordance with the requirements of the Poultry Products Inspection Act or has been inspected and passed by an equivalent State inspection. 8", "Producer\Grower \u2013 1,000 Limit Exemption Limited provisions of the Act apply to poultry growers who slaughter no more than 1,000 poultry in a calendar year for use as human food. A person may slaughter and process on his or her premises poultry that he or she raised and they may distribute such poultry without mandatory inspection when the following five criteria are met [PPIA Section 464(c)(4) \u201cSection 15 (c)(4)\u201d; Title 9 CFR \u00a7381.10(c)]. Criteria: 1. The poultry grower slaughters no more than 1,000 healthy birds of his or her own raising in a calendar year for distribution as human food; 2. The poultry grower does not engage in buying or selling poultry products other than those produced from poultry raised on his or her own farm; 3. The slaughter and processing are conducted under sanitary standards, practices, and procedures that produce poultry products that are sound, clean, and fit for human food (not adulterated); 4. The producer keeps records necessary for the effective enforcement of the Act [Title 9 CFR 381.175]; and 5. The poultry products do not move in commerce. Note: Commerce means the exchange or transportation of poultry products between States, U.S. territories (Guam, Virgin Island of the United States, and American Samoa), and the District of Columbia [PPIA Section 453; Title 9 CFR \u00a7381.1(b)]. Producer\Grower \u2013 1,000 Limit Exemption Notes: \u2022 If any of the five criteria are not met, the owner of the poultry is not eligible for this exemption. \u2022 Records necessary for the effective enforcement of the Act include slaughter records and records covering the sales of poultry products to customers. USDA\FSIS or State employees review such records to determine compliance with the requirement of the sale of no more than 1,000 poultry in a calendar year. 4 Some published copies of the PPIA

number the sections 1to 29 not 451 to 470 as numbered in the United States Codes.

9","Producer\Grower \u2013 20,000 Limit Exemption A poultry grower may slaughter and process more than 1,000 birds as exempt product for distribution as human food when the following eight criteria are met [PPIA Section 464(c)(1)(C) &(c)(3) \u201cSection 15 (c)(4)\u201d; Title 9 CFR \u00a7381.10(a)(5) and (b)(1) and (2)]. Criteria: 1. The producer\grower slaughters and processes, on his or her own premises, no more than 20,000 poultry, raised by him or her, in a calendar year; 2. The producer\grower sells, in a calendar year, only poultry or poultry products he or she prepares according to the criteria for the Producer\Grower \u2013 20,000 Limit Exemption; he or she may not buy or sell poultry products prepared under another exemption in the same calendar year in which he or she claims the Producer\Grower \u2013 20,000 Limit Exemption [PPIA Section (464)(c)(1) last sentence before (c)(2)]; 3. The poultry products are distributed solely by the producer\grower and only within the District of Columbia or the State or Territory in which the poultry product is produced. 4. The poultry are healthy when slaughtered; 5. The slaughter and processing at the producer\grower\u2019s premises are conducted using sanitary standards, practices, and procedures that produce poultry products that are sound, clean, and fit for use as human food (not adulterated); 6. The producer only distributes poultry products he or she produced under the Producer\Grower Exemption; 7. The facility used to slaughter or process the poultry is not used to slaughter or process another person\u2019s poultry unless the Administrator of FSIS grants an exemption [PPIA Section 464(c)(3); Title 9 CFR 381.10b](2)] 8. The shipping containers, when distributed in intrastate commerce (instead of the required features of a label of inspected product) bear: a. producer\u2019s name, b. producer's address, and 5 Some published copies of the PPIA number the sections 1to 29 not 451 to 470 as numbered in the United States Codes. 10","c. the statement, \u201cExempt P.L. 90-492.\u201d Instead of the Federal law, a State law may be cited when operations are exempted under the authority of a State law and the operations are reviewed by a State Agency. Producer\Grower 20,000 Limit Exemption Notes: \u2022 The producer\grower may sell, intrastate, the poultry products he or she prepares to other businesses for resale as meat or meals, including a distributor, hotel, restaurant, retail store, institution, or small enterprise when the product is produced under a Federal or a State exemption. \u2022 FSIS has determined that when a grower producing poultry under the Producer\Grower Exemption rents slaughtering or processing equipment and operates such equipment on his or her premises, he or she is not disqualified for the Producer\Grower Exemption. In this situation, the grower is not required to request an exemption from the Administrator of FSIS. However, the slaughter or processing unit may not be used to slaughter or process another person\u2019s poultry while it is on the renter\u2019s premises. Producer\Grower or Other Person (PGOP) Exemption The term \u201cProducer\Grower or Other Person\u201d (PGOP) refers to a single entity, which may be: (1) A poultry grower who slaughters and processes poultry that he or she raised for sale directly to household consumers, restaurants, hotels, and boarding houses to be used in those homes and dining rooms for the preparation of meals served or sold directly to customers. (2) A person who purchases live poultry from a grower and then slaughters these poultry and processes such poultry for sale directly to household consumers, restaurants, hotels, and boarding houses to be served in those homes or dining rooms for the preparation of meals sold directly to customers. A business may slaughter and process poultry under this exemption

when the following nine criteria are met [PPIA Section 464(c)(1)(D) &(c)(3) \u201cSection 15 (c)(4)\u201d; Title 9 CFR \u00a7381.10(a)(6) and (b)]. Criteria: 6 Some published copies of the PPIA number the sections 1- 29 not 451-470 as numbered in the United States Codes. 11","1. The producer\grower or other person slaughters for processing and sale directly to household consumers, restaurants, hotels, and boarding houses for use in dining rooms or in the preparation of meals sold directly to customers; 2. The PGOP slaughters no more 20,000 poultry in a calendar year that the producer\grower or other person raised or purchased are slaughtered and processed under this exemption; 3. The poultry processed by a PGOP is poultry that the PGOP slaughtered;. 4. The poultry products produced under the PGOP Exemption are distributed solely by the manufacturer and only within the State or Territory or the District of Columbia in which the poultry product is produced; 5. The producer\grower or other person dose not engage in the business of buying or selling poultry or poultry products prepared under other exemptions in the same calendar year he or she claims the Producer\Grower Exemption [PPIA Section 464(c)(1) last paragraph before (c)(2)]; 6. The processing is limited to preparation of poultry products from poultry slaughtered by the PGOP for distribution directly to: 1) household consumers, 2) restaurants, 3) hotels, and 4) boarding houses for use in their dining rooms or in the preparation of meals sold directly to consumers within the jurisdiction were it is prepared; 7. The slaughter and processing at the producer\grower or other person\u2019s facility is conducted in a manner that results in the preparation of poultry products that are wholesome, sound, clean, and fit for human food (not adulterated), [PPIA Section 4 (g)]; 8. The facility used to slaughter and process poultry is not used to slaughter or process another person\u2019s poultry unless the Administrator of FSIS grants an exemption [PPIA Section 464(c)(3); Title 9 CFR 381.10b(2)]; and 9. The shipping containers, when distributed in intrastate commerce, (instead of all the required features of a label for inspected product) bear: a. the processor\u2019s name, b. the address, and c. the statement, Exempt P.L. 90-492. State law, rather than Federal law, may be cited when product is produced in accordance with requirements of a State exemption. Producer\Grower or Other Person Exemption Notes: 12","\u2022 A business preparing poultry product under the PGOP exemption may not slaughter or process poultry owned by another person. \u2022 A business preparing poultry products under the PGOP exemption may not sell products to a retail store or other producer\grower. Small Enterprise Exemption A business that qualifies for the Small Enterprise Exemption may be: (1) A producer\grower who raises, slaughters, and dresses poultry for use as human food whose processing of dressed exempt poultry is limited to cutting up; (2) A business that purchases live poultry that it slaughters and dresses whose processing of the slaughtered poultry is limited to the cutting up; or (3) A business that purchases dressed poultry, which it distributes as carcasses and whose processing is limited to the cutting up of inspected or exempted poultry products, for distribution for use as human food. Under this exemption, a business may slaughter, dress, and cut up poultry for distribution as human food when the following criteria are met [PPIA Section 464(c)(2) & (c)(3) \u201cSection 15 (c)(2) & (c)(3)\u201d; Title 9 CFR \u00a7381.10(a)(7) & (b)].] Criteria: 1. Processing of Federal or State inspected or exempt poultry product is limited to the cutting up of carcasses; 2. The business slaughters and dresses or cuts up no more than 20,000 birds in a calendar year under the exemption; 3. The facility operates and is maintained in a manner that prevents the creation of insanitary conditions and ensures that the product is not adulterated [PPIA Section 464(c)(2);

and Title 9 CFR 381.10(a)(7) and 416.2-416.5); See Attachment 2 for sanitation requirements for official establishments and businesses operating under the Small Enterprise and Retail Store Exemptions; 4. The facility used to slaughter or process poultry is not used to slaughter or process another person's poultry unless the Administrator of FSIS grants an exemption [PPIA Section 464(c)(3); Title 9 CFR 381.10b](2)]; 5. The exempted product is not distributed in interstate commerce; instead, its distribution is limited to premises within the District of Columbia or the State or Territory in which the poultry product is produced; and Note: Poultry products produced under a Small Enterprise Exemption are not misbranded when they bear all of the features of a label for inspected product with the exception that the labeling does not indicate that the product was inspected and passes. Label requirements for this exempt uninspected product include the following: weight or measures; the requirements of , statement indicating why the inspection legend is not permitted; for example, the phrase 'Small Enterprise Exemption from Inspection' is suggested by FSIS but is not a mandatory requirement. Title 9 CFR 381.500(f) is optional for poultry products produced by a small enterprise. The product is not misbranded. 1. Name of the product; 2. Ingredients statement; 3. Statement of the quantity of contents in terms of weight or measures; 4. Name and address of manufacturer; 5. Handling statement; 6. Safe handling instruction that complies with Title 9 CFR 381.125(b)(2)(ii); 7. Date of packing; and 8. Explanatory statement indicating why the inspection legend is not permitted. In addition, if the labeling does not bear nutrition or health claims, the nutrition facts feature, as explained in, Exemption from nutritional labeling is not required for the small enterprise exemption. Small Enterprise Exemption Notes: A small enterprise is not required to have slaughtered the poultry it cuts up under a Small Enterprise Exemption. The small enterprise may purchase Federal or State inspected and passed poultry for its cut up operation and from exempt businesses that are allowed to sell to a small enterprise. A small enterprise may handle exempt product and may cut exempt product produced under the Producer/Grower Exemption. A small enterprise may handle as exempt product through a poultry product that was produced under Federal or State inspection.

14", "A business may slaughter or cut up poultry under the Small Enterprise Exemption for sale to: a. household consumers, b. hotels, c. retail stores, d. restaurants, and e. similar institutions. A small enterprise may sell live poultry to a customer and then slaughter, dress, and cut up the poultry for the customer. Selling live poultry is not the same as buying or selling poultry products. One of the criteria that prevents a business from claiming as 'Custom Slaughter/Processing Exemption'. A small enterprise may not cut up and distribute poultry products produced under the Small Enterprise Exemption to a business operating under the following exemptions: a. Producer/Grower or PGOP Exemption, b. Retail Dealer Exemption, or c. Retail Store Exemptions. Retail Exemption (Store/Dealer/Restaurant): A retail business is a facility where poultry products are sold to a customer (household consumers and hotels, restaurants, and similar institutions) at the retail business and the amount purchased by the customer is considered to be a normal amount for a retail purchase. The Act provides for several types of retail exemptions: (1) the Retail Dealer Exemption, (2) the Retail Store Exemption, and (3) the Restaurant Exemption. The type of poultry slaughter and processing operations a business conducts determines which retail exemption under which the business may produce poultry. A business is qualified to operate

under a retail exemption when the following criteria are met [PPIA Section 454.(c)(2) \u201cSection 5 (c)(2)\u201d; PPIA Section 464.(a)(1) \u201cSection 15 (c)(2)\u201d; Title 9 CFR 381.10(a)(1) and (d)(2)(vi), and 381.10(d)(1) and (d)(2)(i), (ii) and (iii)].  
8 Some published copies of the PPIA number the sections from 1 to 29 not 451-470 as numbered in the United States Codes. 15","Criteria: 1. Only poultry carcasses and parts derived from federally inspected and passed poultry are transported in interstate commerce [Title 9 CFR \u00a7381.10(a)(1)]; 2. Poultry products used in the preparation of meals at a restaurant are derived from federally inspected and passed poultry products or federally exempt poultry products from exempt operations that may sell to restaurants [\u00a7381.10(d)(2)(iv)(2)]; 3. State inspected and passed or exempt State or exempt federal poultry products used in the preparation of poultry products, sold at the retail store, are not transported in interstate commerce, the exempt poultry product must be from an acceptable exempt source a Producer\Grower or Small Enterprise [\u00a7381.10(d)(2)(iii)(c)] (Note: A PGOP cannot sell their products to retailers \u2013 only to household consumers, boarding houses, hotels and restaurants]; 4. The business does not custom slaughter poultry delivered by the owner; 5. The retail business does not prepare exempt products that the business sells to another retail store or a distributor of poultry products; 6. The only poultry slaughtered at a retail store is poultry that is purchased live by the customer, at the retail store, and then the poultry product is prepared according to the customer\u2019s instructions and delivered back to the customer; 7. The business may custom process poultry delivered by the owner provided that the poultry is from an acceptable source, Federal or State inspected and passed, or exempt poultry); 8. The facility operates and is maintained in a manner that prevents the creation of insanitary conditions and ensures that the product is not adulterated [PPIA Section 464(c)(2); and Title 9 CFR 381.10(a)(7) and 416.2-416.5]; See Attachment 2 for sanitation requirements for official establishments and businesses operating under the Small Enterprise and Retail Store Exemptions; 9. Operations of types traditionally and usually conducted at retail stores are conducted in the store and include: a. boning, b. cut up, c. stuffing, d. smoking, e. rendering, or f. salting; 16","10. No canning operation is conducted in the retail store; Note: Poultry products produced under a Retail Store Exemption are not misbranded when they bear all of the features of an official label with the exception that the labeling does not indicate that the product was inspected and passes. Official label requirements include the following: 1. Name of the product, 2. Ingredients statement, 3. Statement of the quantity of contents in terms of weight or measures, 4. Name and address of manufacturer, 5. Handling statement, 6. Safe handling instruction that comply with the requirements of 9 CFR 381.125(b)(2)(ii), 7. Date of packing, and 8. Explanatory statement indicating why the inspection legend is not permitted; for example, the phrase \u201cRetail Exemption from Inspection\u201d is suggested by FSIS but is not a mandatory requirement. In addition, if the labeling does not bear nutrition or health claims, the nutrition facts feature, as explained in, Title 9 CFR 381.500 , is optional for poultry products produced by a business eligible for the small enterprise exemption. 11. Product sold in commerce is not misbranded; Title Exemption from nutritional labeling 12. Sales of poultry and poultry products are in normal retail quantities or served to consumers at the retail store (normal retail quantities are 75 pounds or less to household consumers and 150 pounds or less to hotels, restaurants, and similar institutions); and 13. Sales to hotels, restaurants, and similar institutions do not exceed either one of two limits: 1. 25 percent of the

dollar value of total poultry product sales, or 2. the calendar year dollar limit for retail stores set by the Administrator of FSIS; 17", "Note: retail store dollar limitation is the limit, measured in dollars, on sales of poultry products by retail stores each calendar year to non-household consumers such as hotels, restaurants, and similar institutions. stores may not exceed a specific dollar limit on the sale of poultry products to hotels, restaurants, and similar institutions. dollar limitation is adjusted during the first quarter of the year if the Consumer Price Index, published by the Bureau of Labor Statistics, indicates an increase or decrease of more than \$500 in the price of the same volume of product from the previous year. FSIS publishes a notice of the adjusted dollar limitation in the through products that are derived from USDA inspected and passed poultry that are not further processed at the retail store. To maintain their exemption from inspection under the PPIA, retail The Federal Register. The dollar limitation amount on retail sales does not include pass- Retail Store Exemption Notes: When a retail store that slaughters poultry takes orders for dressed poultry before the arrival of the customer, and also slaughters several birds at one time for various customers that have requested them, the birds must be identified throughout the process so that processed bird that the customer receives is the same live birds selected for or by the customer. How many exemptions may a person or business claim when slaughtering or processing poultry? A person or business may slaughter or process poultry under an exemption if the operation qualifies for the exemption. However, a slaughterer or processor of poultry may not simultaneously operate under more than one exemption. When FSIS or a State reviews a business to determine compliance with the Act and regulations, FSIS or the State inspectors must be informed of which exemption the business is claiming. FSIS or State inspectors will determine compliance based on only one exemption. A business may not simultaneously claim or operate under more than one exemption. 18", "The selection of either the Producer\Grower Exemption or the Producer\Grower or Other Person Exemption is for the calendar year. In the same calendar year, a poultry producer or other person producing product under either the Producer\Grower Exemption or the Producer\Grower or Other Person Exemption may not produce product under another exemption. In addition, a poultry business that slaughters or processes poultry operating under a Custom Slaughter or Small Enterprise Exemption may not operate under the Producer\Grower or Producer\Grower or Other Person exemption in the same calendar year. A facility or business may house more than one exempt operation if there is complete financial and structural autonomy of each operation. A true and complete separation must exist between the business records and the physical structures (rooms and equipment) of the two operations. A facility or business producing product under a Custom Slaughter, Small Enterprise, or Retail Store Exemption may operate under another one of these three exemptions in the same calendar when there is financial and temporal autonomy of each operation. For example, a person using a facility for a custom slaughter business may close the custom slaughter business and open a retail store or small enterprise business at the facility in the same calendar year. Who determines whether an operation qualifies for an exemption? Inspectors of the USDA\FSIS are authorized to make inspections in accordance with the law to ascertain whether any of the provisions of the Act or the regulations applying to producers, retailers, or other persons purporting to be exempt form and requirements (criteria) of the Act have been violated. [Code of Federal Regulations Title 9 Section 381.14 ] A State that does not operate a poultry inspection program at least equal to the Federal poultry inspection program

is a \u201cDesignated State\u201d [Title 9 Code of Federal Regulations Subpart V \u00a7381.220-225]. In a designated State, FSIS is responsible for conducting reviews of establishments operating under exemptions provided for in Section 15 of the PPIA i.e. personnel use, retail dealer, custom slaughter, poultry producers, or small enterprise exemptions and of retail stores operating under the PPIA, Section 5(c)(2) retail exemption. Such reviews may be conducted by a State Agency under a cooperative agreement with FSIS\USDA. When either a State Agency that has a cooperative agreement with FSIS or FSIS determines that an exempt operation does not comply with requirements of the Act, USDA is responsible for enforcement of compliance with the requirements of the Act. In States that operate a poultry inspection program equivalent to the Federal inspection program, a State Agency conducts inspections and reviews of exempted operations. Suspension or termination of exemptions 19", "The Administrator of FSIS may, by order, in accordance with the applicable rules of practice [Code of Federal Regulations Title 9 Part 500] suspend or terminate any exemption with respect to any person whenever FSIS finds that such action will aid in effectuating the purposes of the Act. Failure to comply with the conditions (criteria) of the exemption including but not limited to failure to process poultry and poultry products under clean and sanitary condition may result in termination of an exemption, in addition to other penalties [Code of Federal Regulations Title (Section 318.13)]. Religious dietary exemption To avoid conflicts with certain religious dietary requirements, the PPIA allows for exemption from certain requirements of the PPIA and the regulations when a religious dietary requirement conflicts with the Act or regulations. However, this exemption from certain requirements of the PPIA and the regulations is granted only if the purposes of the Act or regulations are met. Unlike the exemption previously discussed in this guidance, only official establishments may receive an exemption from a specific regulation that conflicts with a religious dietary requirement. An official establishment may request a religious dietary exemption on FSIS Form 5200-1 at the time that the establishment applies for inspection. Poultry prepared in accordance with a religious dietary law under a religious exemption does not bear the official inspection legend but must meet all inspection and regulatory requirements not specifically listed on the submitted application (FSIS Form 5200-1) and exempted on the exemption certificate issued by FSIS. 20", "Attachment 1. Processing limited to cutting up of previously USDA Inspected and Passed Poultry Retail Store Sales limited to household consumers, hotels, or restaurants, or similar institutions. Sales to household consumers in store must be inspected and passed by USDA permitted to cross Stateline, move in \u201cCommerce.\u201d 1 \u2013 Yes, there is a limit of 75 lbs. for household sales and a 150 lbs. limit for HRI sales. ceptions that the official inspection legend cannot be used, modification of the safe handling instructions and the nutrition facts are optional, provided, the labeling does not bear nutrition or health claims. 1. Slaughter of live poultry purchased by consumer at the retail 75% of sales. Sales to retail markets or distributors disqualify an operation from a Retail Store exemption. Product prepared from product previously inspected and passed by USDA permitted to cross Stateline, move in \u201cCommerce \u201c Other, 2 \u2013 25% HRI limitation does apply 3 \u2013 Dollar limitation applicable. store and processed by the retail store operator in accordance with the consumer\u2019s instructions. 2. Processing exempt product may only be distributed in the State, territory, or DC where it is prepared. 22", "Attachment 2 Basic Sanitary Standards Following are general basic sanitary standards, practices, and procedures [9 CFR 416.2-416.5]. The list is a summary of the regulatory requirements for sanitation procedures and practices that are required for a poultry business receiving full U.S. Department of Agriculture inspection and are applicable to poultry exempt operations {Title 9 CFR Part 416}. In addition, specific sanitary practices are described in FSIS\u2019s Sanitation Performance Standards Compliance Guide, dated October 13, 1999. This 92-page document is also available from [http://www.fsis.usda.gov/FSIS\\_Employees/Compliance\\_Guides\\_Index/index.asp](http://www.fsis.usda.gov/FSIS_Employees/Compliance_Guides_Index/index.asp). A. Sanitary operating conditions. All food-contact surfaces and non-food-contact surfaces of an exempt facility are cleaned and sanitized as frequently as necessary to prevent the creation of insanitary conditions and the adulteration of product. Cleaning compounds, sanitizing agents, processing aids, and other chemicals used by an exempt facility are safe and effective under the conditions of use. Such chemicals are used, handled, and stored in a manner that will not adulterate product or create insanitary conditions. Documentation substantiating the safety of a chemical's use in a food processing environment are available to inspection program employees for review. Product is protected from adulteration during processing, handling, storage, loading, and unloading and during transportation from official establishments. B. Grounds and pest control. The grounds of exempt operation are maintained to prevent conditions that could lead to insanitary conditions or adulteration of product. Plant operators have in place a pest management program to prevent the harborage and breeding of pests on the grounds and within the facilities. The operator's pest control operation is capable of preventing product adulteration. Management makes every effort to prevent entry of rodents, insects, or animals into areas where products are handled, processed, or stored. Openings (doors and windows) leading to the outside or to areas holding inedible product have effective closures and completely fill the openings. Areas inside and outside the facility are maintained to prevent harborage of rodents and insects. The pest control substances used are safe and effective under the conditions of use and are not applied or stored in a manner that will result in the adulteration of product or the creation of insanitary conditions. C. Sewage and waste disposal. Sewage and waste disposal systems properly remove sewage and waste materials\feces, feathers, trash, garbage, and paper\from the facility. Sewage is disposed of into a sewage system separate from all other drainage lines or disposed of through

other means sufficient to prevent backup of sewage into areas where product is processed, handled, or stored. When the sewage disposal system is a private system requiring approval by a State or local health authority, upon request, the management must furnish to the inspector a letter of approval from that authority. 23", "D. Water supply and water, ice, and solution reuse. A supply of running water that complies with the National Primary Drinking Water regulations (40 CFR part 141) at a suitable temperature and under pressure as needed, is provided in all areas where required (for processing product; for cleaning rooms and equipment, utensils, and packaging materials; for employee sanitary facilities, etc.). If a facility uses a municipal water supply, it must make available to the inspector, upon request, a water report, issued under the authority of the State or local health agency, certifying or attesting to the potability of the water supply. If a facility uses a private well for its water supply, it must make available to the inspector, upon request, documentation certifying the potability of the water supply that has been renewed at least semi-annually. E. Facilities. Maintenance of facilities during slaughtering and processing is accomplished in a manner to ensure the production of wholesome, unadulterated product. F. Dressing rooms, lavatories, and toilets. Dressing rooms, toilet rooms, and urinals are sufficient in number ample in size, conveniently located, and maintained in a sanitary condition and in good repair at all times to ensure cleanliness of all persons handling any product. Dressing rooms, lavatories, and toilets are separate from the rooms and compartments in which products are processed, stored, or handled. G. Inedible Material Control. The operator handles and maintains inedible material in a manner that prevents the diversion of inedible animal products into human food channels and prevents the adulteration of human food. 24", "Attachment 3 FSIS District Office Contact Information

The Listeria rule establishes three alternative ways to address post \u2013lethality contamination of Listeria monocytogenes (*L. monocytogenes*) in these products. Under Alternative 1, the establishment applies a treatment to the product after its exposure to the processing environment (post-lethality treatment) and uses a growth inhibitor (antimicrobial agent or process) to prevent the growth of *L. monocytogenes* in the product up to its declared shelf life. Under Alternative 2, the establishment can use either a post-lethality treatment or an antimicrobial agent\process to control *L. monocytogenes*. Alternative 3 requires the establishment to have a sanitation program controlling *L. monocytogenes* contamination in the processing environment and on the product. The document gives guidance to establishments on how to determine whether their product is RTE (p.7), and on actions the establishments can take if the product is RTE and exposed to the processing environment after the basic lethality treatment. Information provided in the guidelines on the control methods required for Alternative 1, Alternative 2, and Alternative 3 can help establishments in choosing the alternative to choose for their products (pp.7-21). In these guidelines, the Agency provides information on how to validate, document, and apply the post-lethality treatment and antimicrobial agent or process using, among other approaches, a challenge study, a peer reviewed article from a scientific journal, or a modeling program. The guidelines provide examples of challenge studies and links to guidance documents on how to conduct a challenge study and a shelf life study. The guidelines also include a chart on growth limits for *L. monocytogenes* (p. 13). If an establishment uses pH, water activity, or temperature below the growth limits of this pathogen, it can be considered as using an antimicrobial agent or process. The guidelines on sanitation include topics on possible sources of *L. monocytogenes* contamination, places in processing where contamination is likely to occur, general cleaning and sanitizing of the processing environment and equipment, methods to determine efficacy of cleaning and sanitizing procedures, controlling traffic especially between RTE and a non-RTE sections, employee hygiene, sanitizers that can be used,

and food contact and environmental testing (pp. 25-45). The guidelines also include a section on how to determine whether the product should be considered deli meat or hot dog. They also provide an example of a test and hold scenario that would occur when an establishment test of a food contact surface is positive, and the product is held while corrective actions and retesting are conducted (pp. 44, 68-71). The Agency has also included tables to show: 1) the recommended minimum log reduction of *L. monocytogenes* that is necessary for the post-lethality treatment to achieve to be considered under Alternative 1 and 2 (p.21); 2) the expected log suppression by the antimicrobial agent or process throughout the shelf life of the product (p. 21); and 3) the recommended frequency of testing food contact surfaces for the three alternatives (p. 42). The guidelines discuss how the establishment can receive reduced sampling from FSIS, labeling issues, information on new technologies and methods for testing food contact and environmental surfaces for *Listeria* spp., *Listeria*-like organisms and *L. monocytogenes*.," "Updated Compliance Guidelines May 2006 A. Introduction Food Safety and Inspection Service (FSIS) developed Compliance Guidelines to help the establishments producing Ready-to-Eat (RTE) meat and poultry products, especially small and very small establishments, in their use of control methods for *L. monocytogenes* to comply with the requirements of 9 CFR 430. Their purpose is to show establishments how the control methods can, if used singly or in combination, prevent or eliminate *L. monocytogenes* contamination in the product during post-lethality exposure. Establishments can use the guidelines to choose control methods that are best suited to their processing. Some establishments may have already instituted their control methods, which they have verified to be effective in controlling the pathogen and may not need to change their methods to follow these guidelines. However, FSIS will make a determination on the effectiveness of the controls and establishment verification testing when deciding how FSIS will conduct its verification procedures in the establishment. The interim final rule applies only to post-lethality exposed RTE meat and poultry products. Products containing both raw and cooked ingredients (e.g., a frozen entr\u00e9e containing blanched vegetables and fully cooked meat) will not be considered RTE if: (1) the product label prominently indicates the need to cook the products for safety, and (2) there are validated cooking instructions. A frozen product to be cooked may be either RTE or not ready-to-eat (NRTE) unless a food standard of identity requires that the product be RTE. FSIS distinguishes between RTE and NRTE foods in Attachment 2. This is the second update for these guidelines from the original document posted on the FSIS website on October 6, 2003. The first update in October 2004 responded to comments and questions that FSIS received about the rule and addressed questions that were asked during the workshops that the Agency held in preparation for the implementation of the interim final rule. This second update responds to additional questions and comments received. It also includes documents resulting from the Phase 1 activities for the risk-based verification for the rule. Added or revised sections are in color and in a different font. The updated version includes: \u2022 Summary of Guidance Material (p. 3) \u2022 Discussion of reduced frequency of sampling by the Agency for some products (pp. 13 and 20) \u2022 Adding the site for list of new technologies reviewed with \u201cno objection\u201d for use in establishments (p. 25) \u2022 Modified the section (VII. 3.) on the testing of food contact and environmental services (p. 42) and modified the title (p. 1 and 42) \u2022 Announcement of \u201cIndustry Best Practices for Holding Tested Products\u201d (p. 46) \u2022 Revision of section H. Risk-Based Verification Testing Program to

describe current and projected risk-based verification program (p. 48) 4", "Updated Compliance Guidelines May 2006 \u2022 Attachment 3. Deleted the draft production volume form and replaced with the website link to the form (p.58) \u2022 Attachment 6. Clarification on testing food contact surfaces (p. 71) \u2022 Attachment 7. Procedures for the Evaluation of Establishment Control Programs for Listeria monocytogenes (p.76) \u2022 Attachment 8. Guidance Derived from a Review of Comprehensive Food Safety Assessments Associated with Compliance (p. 99) \u2022 Attachment 9. Links to guidelines for Validation(p. 102): \u201cGuidelines for Conducting Listeria monocytogenes Challenge Testing of Foods\u201d and \u201cConsiderations for Establishing Safety-Based Consume-by-Date Labels for Refrigerated Ready-to-Eat Foods\u201d These guidelines will be updated periodically to include validated and other effective procedures as they become available.

B. Control of Listeria monocytogenes Using Three Alternatives

Listeria monocytogenes is a pathogen that is widely distributed in the environment such as plants, soil, animal, water, dirt, dust, and silage. Because L. monocytogenes may be present in slaughter animals and subsequently in raw meat and poultry as well as other ingredients, it can be continuously introduced into the processing environment. The pathogen can cross-contaminate food contact surfaces, equipment, floors, drains, standing water and employees. In addition, the pathogen can grow in damp environments and can establish a niche and form biofilms in the processing environment that are difficult to eliminate during cleaning and sanitizing.

Other characteristics of L. monocytogenes that makes it a formidable pathogen to control are its heat and salt tolerance and its ability to grow at refrigeration temperatures and survive at freezing temperatures. The lethality treatment received by processed ready-to-eat (RTE) meat and poultry products generally eliminates L. monocytogenes; however products can be recontaminated by exposure after the lethality treatment during peeling, slicing, repackaging, and other procedures. Several outbreaks of foodborne illness resulting in hospitalization, miscarriage, stillbirth, and death have been linked to the consumption of deli meats and hotdogs containing L. monocytogenes. One of the most likely causes of L. monocytogenes contamination in these outbreaks was traced to post-lethality exposure and contamination by the pathogen. Deli and hotdog products are examples of RTE meat and poultry products that receive a lethality treatment to eliminate pathogens, but are subsequently exposed to the environment during peeling, slicing, and repackaging operations. If L. monocytogenes is present on the equipment used for peeling, slicing or repackaging, the pathogen can be transferred to the product upon contact. These products are examples of RTE meat and poultry products that can support the growth of L. monocytogenes during refrigerated storage. Since RTE products are consumed without further cooking, if they are contaminated, there is a possibility of the occurrence of foodborne illness. The \u201cFDA/FSIS Draft Assessment of the Relative Risk to Public Health from Foodborne Listeria monocytogenes Among Selected Categories of Ready-to-Eat Foods\u201d ([www.foodsafety.gov/~dms/lmr2-su.html](http://www.foodsafety.gov/~dms/lmr2-su.html)) indicated that deli meats and hotdogs posed the greatest per serving risk of illness/death from L. monocytogenes. RTE meat and poultry processing plants must include control programs for Listeria monocytogenes in their HACCP plans, Sanitation SOP or prerequisite programs to prevent its growth and proliferation in the plant environment and equipment, and prevent the cross-contamination of RTE products. The FSIS Listeria risk assessment (<http://www.fsis.usda.gov/OPHS/Lmrisk/DraftLm22603.pdf>) indicated that the use of a

combination of intervention methods to control *L. monocytogenes* in deli meats exposed to the environment after the lethality treatment has the greatest impact on lowering the risk of illness or death from *L. monocytogenes*. The Agency used these risk assessments as resources in developing the regulations to control *L. monocytogenes* in RTE meat and poultry processing. The interim final rule for the control of *Listeria monocytogenes* (9 CFR 430) includes three alternative approaches that establishments can take in the processing of RTE meat and poultry products during post-lethality exposure. Under Alternative 1, an establishment applies a post-lethality treatment and an antimicrobial agent or process to control *L. monocytogenes*. Under Alternative 2, an establishment applies either a postlethality treatment or an antimicrobial agent or process. In Alternative 3, the establishment does not apply any post-lethality treatment or antimicrobial agent or process. Instead, it relies on its sanitation program. Products produced under Alternative 1 and 2 are formulated and processed to eliminate *L. monocytogenes* and/or limit its growth if it is present. That means the number of organisms shall not increase during the product's shelf life to detectable levels, or levels which may result in a public health hazard. These alternatives provide greater control compared to Alternative 3 which involves only sanitation to control *L. monocytogenes*. Consequently, the rigor or stringency of the control methods decreases from Alternative 1 to 3. An establishment must identify which alternative their RTE product falls into based on its control program for *L. monocytogenes*. An establishment can choose to apply new control methods and subsequently move from one alternative to another; however, it must apply the control methods required for the specific alternative that it moved into. Each alternative has specific requirements with which the establishment must comply. A systematic table of the requirements for each alternative can be found in Attachment 1. FSIS recognizes that establishments may be producing products that fall under different alternative control programs. These various products may best be covered in individual HACCP plans, though an establishment is free to adopt whatever program can best enable compliance. Conversely, products processed according to different alternatives, may by covered by a single HACCP plan. Products are grouped in a single HACCP plan when the hazards, CCPs, and critical limits are essentially the same, provided that any required features of the plan that are unique to a specific product are clearly delineated in the plan and observed in practice. Thus, a single HACCP plan could cover hotdogs 6", "Updated Compliance Guidelines May 2006 formulated with and without antimicrobial agents (Alternative 2 and Alternative 3), provided that the HACCP plan clearly distinguishes any critical differences. In addition, if an establishment uses the same food contact surfaces (FCS) on the same production day (clean-up to clean-up) for products falling within two alternatives, the products should be treated as if they were in the higher risk category with respect to on-going verification by the establishment, including testing of product, food contact surfaces and the environment. Products Covered by the *Listeria* rule: Establishments should determine the alternatives to which it will adhere in its processes. The following steps can guide establishments in making this decision: \u2022 Determine whether product is RTE or not RTE (NRTE) Resource 1 of the Directive and Attachment 2 of these Compliance Guidelines can guide the establishment in determining whether its product is RTE or NRTE. NRTE products are not covered by the rule. \u2022 If the product is RTE, the establishment should determine whether the product is exposed to the environment after the lethality treatment (e.g., cooking) and before packaging. Examples of exposure to the

environment after the lethality treatment are the following: 1) when product is removed from its cooking bag and re-packaged; 2) when product is removed from the cooking bag and sliced or cut-up and re-packaged; or 3) when product is peeled and repackaged; or when it is fermented or salt-cured or dried and smoked and packaged. (e.g., roast beef, cooked ham for slicing, hotdogs, fermented sausage, cured ham, and jerky). \u2022 If the product is not exposed to the environment after the lethality treatment and before packaging, then the product is not covered by the Listeria rule. Examples of these products are fully cooked product in cook-in-bag that leaves the official establishment in the intact cooking bag; thermally processed, commercially sterile products; and products receiving a lethality treatment and hot-filled as long as the lethality temperature and sanitary handling are maintained during the period of time in which the product moves from the point of lethality to the point of packaging. \u2022 If the product is post-lethality exposed, the establishment should determine the control methods it is using to control *L. monocytogenes* during the post-lethality exposure. The control methods used by the establishment will determine to what alternative the product can be categorized. 1. Alternative 1 Alternative 1 requires the use of post-lethality treatment (which maybe an antimicrobial agent or process) to reduce or eliminate *L. monocytogenes* and an antimicrobial agent or process to suppress or limit the growth of the pathogen. For RTE products that are cooked and then removed from their cooking bag and sliced, diced or repackaged, there is a risk of cross contamination from the equipment, conveyor belts and the processing environment. These products need to be aseptically processed and then repackaged under strict sanitary conditions to prevent contamination from *L. monocytogenes*. 7", "Updated Compliance Guidelines May 2006 a. Post-Lethality Treatment Post lethality treatments such as steam pasteurization, hot water pasteurization, radiant heating and high pressure processing have been developed to prevent or eliminate postprocessing contamination by *L. monocytogenes*. RTE products where post-lethality treatments were shown by studies to be effective in reducing the level of *L. monocytogenes* are whole or formed ham, whole and split roast beef, turkey ham, chicken breast fillets and strips, and sliced ham, sliced turkey, and sliced roast beef. Post-lethality treatments can be applied as a pre-packaging treatment, e.g. radiant heating, or as post-packaging treatments, e.g., hot water pasteurization, steam pasteurization, and high pressure processing. Ultra violet treatment can be used either as a post-lethality treatment or antimicrobial agent or process depending on whether it eliminates, reduces or suppresses growth of *L. monocytogenes*. Some of the published studies on postlethality treatments are reviewed in Attachment 4. Studies on post-lethality treatments showed reductions of inoculated *L. monocytogenes* from 1 to 7 log<sub>10</sub> CFU/g depending on the product type, and duration, temperature and pressure of treatment. Higher log reductions were obtained when both pre-packaging and post-packaging surface pasteurizations were applied, and when post-lethality pasteurization was combined with the use of antimicrobial agents. Establishments should refer to the details of these studies if they want to use the intervention method in their processing. The guidelines will be updated to include studies or other methods as they become available. Validation of Post-lethality Treatment The post-lethality treatment that reduces or eliminates the pathogen must be included in the establishment\u2019s HACCP plan. The post-lethality treatment must be validated according to 9 CFR 417.4 as being effective in eliminating or reducing *L. monocytogenes* to an undetectable level, and the validation should specify the log reduction or suppression achieved by the post-lethality treatment and

antimicrobial agents. Scott et al. (2005) developed guidelines for conducting challenge testing of foods for *L. monocytogenes* (Attachment 9). The effectiveness of the post-lethality treatments and antimicrobial agents must be verified, and establishments should make the verification results available to FSIS personnel upon request. FSIS expects the establishment's HACCP documentation to demonstrate that the post-lethality treatment is adequate to eliminate or reduce *L. monocytogenes* to an undetectable level. In cases of pre-packaging treatment, the establishment must be able to demonstrate how the level of contamination that may occur before packaging is eliminated. An establishment can use available published research studies as reference for their validation provided these studies use the product type or size, the type of equipment, time, temperature, pressure and other variables used in the study in order to result in equivalent level of reduction of *L. monocytogenes*. An establishment that uses products, treatments or variables other than those used in the referenced studies must perform its own validation studies to determine the effective reduction of *L. monocytogenes* as a result of the post-lethality treatment or antimicrobial agent applied to the products. Some of the published studies use different products and report a range of levels of reduction of 8<sup>o</sup>, "Updated Compliance Guidelines May 2006 L. monocytogenes. In this case, the establishment must validate the use of the postlethality treatment or antimicrobial agent for its specific products. The establishment must specify the level of reduction achieved by the post-lethality treatment or antimicrobial agent applied in its validation to show that the product is safe. In the absence of published peer-reviewed paper that would contain information needed for validation, unpublished studies may be used provided there is supporting documentation that the data and analysis of results demonstrate that the specific level of application on specified products or range of products is effective to produce a safe product. In addition to the validation of the post-lethality treatment and antimicrobial agent, the establishment must verify its effectiveness by testing for *L. monocytogenes*.

**Antimicrobial Process that Acts also as a Post-lethality Treatment**

An example of an antimicrobial process that controls the growth of *L. monocytogenes* in the post-lethality environment is a lethality process that renders a RTE product shelf stable. Shelf stable products are formulated with salt, nitrites and other additives, and processed to achieve a water activity, pH and moisture-protein ratio that will reduce the level of *L. monocytogenes* and other pathogens during processing. In addition, the lethality treatment exerts a continuing bactericidal and bacteriostatic effect in the product, enabling the product to not support the growth of *L. monocytogenes* and other pathogens during the shelf life of the product at ambient temperatures. Since products with water activity less than 0.85 will not support the growth of *L. monocytogenes* and can sometimes even cause *L. monocytogenes* death, FSIS will consider water activity of <0.85 at the time the product is packed to be a post-lethality treatment if there is a bactericidal effect (death of bacterial cells leading to a reduction in number) in the specific product, and the establishment has provided support documentation to document that the intended effect occurs prior to distribution of the product into commerce. In this case, the antimicrobial process could serve as both a postlethality treatment and growth inhibitor. The establishment should have documentation on file (e.g., copy of a published report, challenge study) to demonstrate the effectiveness of the lethality treatment through the shelf life of the product. These shelf stable products can be classified in Alternative 1 if the requirements for this alternative are satisfied. The requirement that an antimicrobial process or

product formulated with an antimicrobial agent suppress or limit growth throughout the commercial shelf life means that an establishment must have validated that the process or formulation does what is claimed. These validation records must be available to FSIS. Establishments must include in their HACCP plans the antimicrobial process used (e.g. drying, cooking\frying, or rendering) and the water activity achieved that renders the product shelf stable. Examples are shelf stable RTE jerky, country cured ham, pepperoni, dried soups, and pork rinds. Pre-packaging Treatment as a Post-lethality Treatment A pre-packaging treatment such as radiant heating can be used as a post-lethality treatment as long as it is validated to eliminate or reduce the level of *L. monocytogenes*. Since this is a post-lethality pre-packaging treatment, there is possible exposure to the environment after the treatment and before packaging. If there is separation between the treatment and packaging, then conditions have to be met to ensure a hygienic 9", "Updated Compliance Guidelines May 2006 environment to preclude contamination, or the post-lethality treatment would not likely be considered effective by FSIS. Some establishments may place the packaging machine right after the radiant heat treatment to reduce or eliminate this exposure. Support documentation must be made a part of the hazard analysis decision-making documents and validation data must be included in the HACCP plan. Studies have also shown that the use of pre-packaging treatment combined with a post-lethality treatment resulted in a higher log reduction of the pathogen. Post-lethality Treatment Not a Critical Control Point (CCP) in the HACCP Plan The rule states that *L. monocytogenes* is a hazard reasonably likely to occur for postlethality exposed product unless there is a control measure incorporated in the HACCP plan, prerequisite program or Sanitation SOP. For Alternative 1 or Alternative 2 (postlethality treatment) control measures, if a post-lethality treatment is used, it must be included in the establishment's HACCP plan as a CCP. FSIS encourages the use of any effective intervention for controlling *L. monocytogenes* contamination. However, if an establishment uses a post-lethality treatment for its product but does not incorporate the post-lethality treatment as a CCP, the post-lethality treatment cannot be used to justify Alternative 1 or 2 (post-lethality treatment). It could place the control measures for the operation in the Sanitation SOP or prerequisite program and the product can be categorized in Alternative 2 (antimicrobial agent) or Alternative 3. Why an Antimicrobial Agent can be included in the HACCP Plan, Sanitation SOP or prerequisite program. If an establishment chooses Alternative 2 and chooses to use an antimicrobial agent or process, the establishment can include the antimicrobial agent or process as a CCP in the HACCP plan, in the Sanitation SOP, or in a prerequisite program. The Agency gave establishments this flexibility because the Agency believes that how establishments choose to address control of *L. monocytogenes* will determine how they fit in the hierarchy. Antimicrobial agents or processes do not necessarily eliminate or reduce a food safety hazard from occurring but rather control for the hazard, by preventing or suppressing the growth of *L. monocytogenes*. A post-lethality process is applied at a specific step in the process that eliminates, reduces to an acceptable level, or prevents a food safety hazard, i.e., a critical control point. However, when the antimicrobial agent does eliminate or significantly reduce *L. monocytogenes*, it could be designated a CCP in the HACCP plan. On the other hand, if it only suppresses growth of *L. monocytogenes*, it could be addressed in the Sanitation SOP or other prerequisite programs. Hot-packed products: edible oils and fats, lard, soups Edible oils and fats resulting from a rendering process that processes them to 180\u00ba F and maintains at 160\u00ba F, with a

water activity of less than 0.2 making them shelf stable are considered RTE. Rendering is intended to make this meat food product a ready-to-use ingredient in the preparation of other foods, e.g., edible tallow and lard are used as shortening. They do not require additional lethality treatment before being consumed. If these products are hot filled (as defined above) and packaged, they are not considered post-lethality exposed and therefore are not covered by the rule. However, these products would be considered NRTE and not covered by the rule if the process calls for partially 10", "Updated Compliance Guidelines May 2006 rendering animal fat for tallow or lard and then further processing or finished rendering in another plant. Soups and other products that are cooked to eliminate pathogens and hot-packed in the final packaging material are RTE, but are not considered post-lethality exposed. Therefore the Listeria rule does not apply.

b. Antimicrobial Agents or Processes

Antimicrobial agents and processes must suppress or limit the growth of *L. monocytogenes* throughout the product shelf life i.e., the amount of time the product can be stored under specified conditions and still remain safe with acceptable quality. Antimicrobial agents were shown in research studies to reduce the levels of *L. monocytogenes*. These include lactates and diacetates added in the formulation and growth inhibitors in the immediate packaging material. These were shown to be effective in the control *L. monocytogenes* in RTE products such as hotdogs, bologna, cotto salami, and bratwurst. Antimicrobial agents can be added to the product during formulation, to the finished product or to the packaging material to inhibit growth of *L. monocytogenes* in the postlethality exposed product during its refrigerated shelf life. Lactates and diacetates are some antimicrobials added to the formulation of RTE meat and poultry products. Establishments should use antimicrobial agents that have been approved by FDA and FSIS for processed RTE meat and poultry products. FSIS recently increased the permissible levels of sodium diacetate as a flavor enhancer and as an inhibitor of pathogen growth to 0.25 % (65 FR 3121-3123\2000). The rule also permitted the use of sodium lactate and potassium lactate in fully cooked meat, meat food products, poultry, and poultry food products, except for infant foods and formulas at levels of up to 4.8 % of total product formulation for the purpose of inhibiting the growth of certain pathogens. Approved antimicrobials for processed meat and poultry products can be found in 9 CFR 424.21 and in Directive 7120.1. The addition of antimicrobials in the formulation must be included in the ingredient statement of the label. Studies on antimicrobials added to the packaging material or active packaging showed about 1-2 log<sub>10</sub> CFU\g reduction of *L. monocytogenes* during the refrigerated shelf life of the products. Based on published studies, growth reduction or inhibition achieved by adding these antimicrobials to product formulation depends on a variety of factors, such as the level of antimicrobial agent added, product formulation and whether the agent was added during formulation or to the finished product. Depending on the amount of antimicrobials and other growth inhibitors added to the product formulation and other ingredients in the product, growth inhibition of *L. monocytogenes* was shown to range from 30 days to 120 days at refrigerated temperatures. Some published studies on antimicrobials are reviewed in Attachment 4. Establishments should refer to the details of the studies if they want to use the intervention method in their processing. A report of the National Advisory Committee for Microbiological Criteria for Foods gives guidance on 11", "Updated Compliance Guidelines May 2006 how to establish safety-based consume-by date labels for RTE foods, and can be found in Attachment 9. An establishment that uses agents that inhibit *L. monocytogenes* on equipment and food contact surfaces in addition to using growth inhibitors

in the product formulation can qualify the product for Alternative 2 using antimicrobial agents. Using these inhibiting agents on equipment and food contact surfaces can be considered as part of the sanitation program. These inhibiting agents applied to equipment and food contact surfaces must be GRAS and approved by FDA. Antimicrobial Processes Some RTE products with added salt, nitrites and other additives achieve a water activity, pH, or moisture-protein-ratio that will reduce the level of *L. monocytogenes* and other pathogens during processing and continue to inhibit the growth of the pathogens during the refrigerated shelf life. These products are not shelf stable because they need to be refrigerated during their shelf life, but because of the water activity and pH attained during the initial lethality treatment, these products may not support the growth of *L. monocytogenes* during its refrigerated shelf life. These products can be classified as using an antimicrobial agent or process. Examples of these products are RTE, not shelf stable fermented sausages and country cured hams. Another antimicrobial process that controls the growth of *L. monocytogenes* in the postlethality environment is freezing of RTE products. Freezing prevents the growth of any microorganisms in the product because their metabolic activities are arrested, but depending on the method and length of freezing and other factors, some microbial kill can also result. Like other microorganisms, *L. monocytogenes* is resistant to freezing. Once the product is thawed, metabolic activities of microorganisms may resume, depending on whether the microorganisms are killed, injured, or not affected at all. Therefore this antimicrobial process is only effective while the product is frozen. The requirement that a product remain frozen throughout its shelf life therefore excludes situations where a product is distributed frozen and then thawed and sold as a refrigerated product. If the product is thawed as part of the preparation process by the consumer, the product will be deemed to have been frozen throughout its shelf life. Labels of RTE frozen products contain cooking instructions for the frozen product and for thawed and refrigerated product, and instructions for thawing at refrigerated temperatures. Examples of frozen RTE products are fully cooked frozen chicken nuggets, fully cooked frozen chicken breast patties or fully cooked frozen dinners. The chart below shows the growth limits for *L. monocytogenes*. These limits represent scientific consensus as to the temperature, pH, and water activity levels for *L. monocytogenes* (ICMSF, 1996). The pathogen can grow between the minimum and maximum levels. The pathogen cannot grow below the minimum growth limits and above the maximum growth limits. Establishments with processes that achieve levels below the minimum limits can use these as their control for the pathogen. Establishments that comply with the levels below the minimum growth parameters need not conduct further validation for their products to prove that growth of *L. monocytogenes* is not 12", "Updated Compliance Guidelines May 2006 13 supported throughout the shelf-life of the product. The Agency will conduct the least amount of verification, including sampling, within the Alternative on processes or products that have been demonstrated to not support any growth of *L. monocytogenes*. The establishment can place the attached reference on file in their control program documentation. However, the establishment should conduct on-going monitoring and verification activities to demonstrate that they are maintaining the conditions for pH, water activity, or temperature. Growth limits for *Listeria monocytogenes* (ICMSF, 1996) Minimum Optimum Maximum Temperature -0.4 °C (31.3 °F) 37 °C (98.6°F) 45 °C (113 °F) pH 4.39 7.0 9.4 Water activity 0.92 --- The antimicrobial agent or process that limits or suppresses *L. monocytogenes* must be included in the

establishment's HACCP plan, or sanitation SOP, or other prerequisite program. The establishment must have documentation in its HACCP plan, Sanitation SOP or other prerequisite program to demonstrate that the antimicrobial agent or process, as used, is effective in suppressing or limiting growth of *L. monocytogenes*. The establishment must validate and verify the effectiveness of its antimicrobial agent or process included in its HACCP plan in accordance with 9 CFR 417.4. If the antimicrobial agent or process is in the Sanitation SOP, the effectiveness of the measures must be evaluated in accordance with 9 CFR 416.14. If the control measures for *L. monocytogenes* are contained in a prerequisite program other than a Sanitation SOP, the program must ensure that the program is effective and does not cause the hazard analysis or the HACCP plan to be inadequate. The establishment must include the program and the results produced by the program in the documentation that the establishment maintains as required in 9 CFR 417.5. The establishment must include supporting documentation to show the effectiveness of the antimicrobials in suppressing or limiting *L. monocytogenes* in the HACCP plan, Sanitation SOP or prerequisite programs. An establishment can use published studies as reference for its validation and supporting documentation as long as it uses the same treatment variables as those used in the study. These variables include among others, specific antimicrobial agents and products, concentration, time and temperature of effectiveness. Use of antimicrobial singly or in combination, with different concentration and other variables, and for products not used in the studies must be validated or tested for their effectiveness. This must be validated for the HACCP plan, or documented in the Sanitation SOP or other prerequisite programs. The establishment must verify that the antimicrobial program is effective by testing product for *L. monocytogenes* and must verify that it does not cause the hazard analysis or the HACCP plan to be inadequate. That is, an effective prerequisite program will reduce the likelihood of occurrence of a hazard so that the product is safe. Based on such a program, an establishment could deem a hazard not reasonably likely to occur in its hazard analysis and therefore a CCP", "Updated Compliance Guidelines May 2006 for the hazard may not be needed. However, if the prerequisite program is not effective (or is not being followed), it means the hazard may become reasonably likely to occur. In such a case, the HACCP plan would be inadequate, since it does not include a CCP for the hazard. Accordingly, FSIS expects that establishments will routinely assess the effectiveness of the prerequisite programs and make any necessary adjustments to ensure that *L. monocytogenes* does not become a hazard reasonably likely to occur. An establishment with products in Alternative 1 must maintain sanitation in the postlethality processing environment in accordance with Part 416. The establishment must make available upon request to FSIS inspection personnel, the verification results that demonstrate the effectiveness of its controls, whether from carrying out its HACCP plan, or its Sanitation SOP, or other prerequisite program. The post-lethality processing environment encompasses all areas an exposed product goes through from the end of the lethality step to the time it is packaged. Should a post-lethality processing environment contact surface test positive, the establishment should investigate the potential source of the positive finding, take corrective actions to eliminate the source, and verify the effectiveness of the corrective actions. In certain situations, the source of Listeria may be the specific equipment that tested positive, such as a slicer. In other situations, such as a positive on a conveyor belt, the source may be a different location than the area tested. FSIS considers a product to be adulterated if a food contact surface, such as a surface of equipment used in the production of

the product, tests positive for *L. monocytogenes*. However, if a RTE post-lethality exposed product receives a post-lethality treatment (Alternative 1 or Alternative 2), that product which came in direct contact with a food contact surface that tested positive for *L. monocytogenes* would not summarily be considered adulterated. This is because the post-lethality treatment should have been validated and documented in the establishment's HACCP plan to be effective in eliminating or reducing *L. monocytogenes*. Without such validation and documentation, the establishment would have to present compelling argument for why the post-lethality treatment was effective for the Agency to conclude that the product is not adulterated. The product disposition would be made as part of the establishment's corrective actions under 9 CFR 417.3 or 416.15. Establishments have been using prerequisite programs before in their processing operations, and the Agency has recently included the use of prerequisite programs as an option in another policy document. However, giving the establishment the option to include the antimicrobial agent or process in a prerequisite program in this rule is the first time prerequisite programs are recognized in codified regulations. An establishment with products in Alternative 1 must have a post-lethality treatment that effectively reduces or eliminates *L. monocytogenes*, and an antimicrobial agent or process that suppresses any growth of the pathogen and extends the effect of the post-lethality treatment during the shelf life of the product. The Agency considers these treatments to be effective in controlling the pathogen resulting in a safe RTE product. If an establishment has an effective Sanitation SOP, any post-lethality contamination by *L. monocytogenes* would be very low, so the post-lethality treatment and the antimicrobial 14", "Updated Compliance Guidelines May 2006 will be able to reduce or eliminate this contamination. If there is gross contamination, the effectiveness of the treatments may be reduced or negated. Therefore the Agency is relying on the establishment's Sanitation SOP to prevent contamination with *L. monocytogenes*, and the post-lethality treatment and antimicrobials to further reduce or eliminate or suppress the pathogen. Because of this combination of controls, the Agency is not requiring establishments to have a testing program for food contact surfaces. However, testing is recommended. Testing food contact surfaces in Alternative 1 could be minimal and primarily serve as a means to verify that the sanitary conditions in the establishment will not overwhelm the post-lethality treatment. A positive test on a food contact surface should trigger the establishment to review its sanitation program and post-lethality treatment to ensure that the treatment was properly applied for the product that came into contact with the positive. Furthermore, the establishment may determine that it is appropriate to conduct a product test after the post-lethality treatment to provide additional assurance that the treatment was effective. The establishments may test food contact surfaces for *L. monocytogenes*, or its indicator organisms, *Listeria* spp. or *Listeria*-like organisms periodically, to verify that their Sanitation SOP is effective. *L. monocytogenes* belongs to the *Listeria* genus or group and species (sp.) *monocytogenes*. The genus *Listeria* includes other species (spp.) in addition to *monocytogenes*. Therefore a positive test for *Listeria* spp. or *Listeria*-like organisms would indicate the potential presence of the pathogen. If these specific indicator organisms test negative, this is indicative that *L. monocytogenes* is not present. Aerobic plate counts (APC), total plate counts (TPC), and coliforms are not appropriate indicator organisms for *L. monocytogenes*. Results from these tests do not indicate the presence or absence of the pathogen, although they could provide a measure of general sanitation. Guidelines on

sanitation procedures and food contact surface testing for *L. monocytogenes* or its indicator organisms, *Listeria* spp. or *Listeria*-like organisms, are found in section G-VII-3. 2. Alternative 2 An establishment that identifies its products in Alternative 2 must apply either a post lethality treatment or an antimicrobial agent or process that controls the growth of *L. monocytogenes*. Post-lethality treatments and antimicrobial agents and processes discussed above in the section on Alternative 1 can be used for Alternative 2. If an establishment uses a post-lethality treatment, it must have the post-lethality treatment in its HACCP plan and the treatment must be validated according to 9 CFR 417.4 as being effective in reducing or eliminating *L. monocytogenes* specifying the log reduction achieved by the post-lethality treatment. The effectiveness of the post-lethality treatment should be verified by testing the finished product for *L. monocytogenes*, and the verification results should be made available to FSIS personnel upon request. FSIS expects the establishment to conduct on-going verification of the CCP as detailed in its HACCP plan. The sanitary conditions likely will have a direct bearing on whether or not the post-lethality treatment is effective. If an establishment has a product identified in Alternative 2 and uses a post lethality treatment to control *L. monocytogenes* in its product, it is not required to test food contact surfaces in the post-lethality environment, 15", "Updated Compliance Guidelines May 2006 although it is recommended. However, FSIS most likely will conduct verification testing less frequently if the establishment tests food contact surfaces for *L. monocytogenes*, or its indicator organisms (*Listeria* spp. or *Listeria*-like organisms). Under Alternative 2, an establishment that only uses an antimicrobial agent or process to control *L. monocytogenes* in its product must have the agent or process included in the establishment\u2019s HACCP plan, or sanitation SOP, or other prerequisite program. The establishment should have documentation in its HACCP plan, Sanitation SOP or other prerequisite program to demonstrate that the antimicrobial agent or process, as used, is effective in suppressing or limiting growth of *L. monocytogenes*. The establishment should document the log levels of the pathogen that the antimicrobial agent or process can suppress and the length of time under specific temperatures in days that the antimicrobial is effective. The establishment must validate and verify the effectiveness of its antimicrobial agent or process included in its HACCP plan in accordance with 9 CFR 417.4. The Agency expects that the use of post-lethality treatments or antimicrobial agents and processes, will prevent a significant increase in numbers of organisms during the product\u2019s shelf life to levels resulting in a public health hazard. If the antimicrobial agent or process is in the Sanitation SOP, the effectiveness of the measures must be evaluated in accordance with 9 CFR 416.14. If the control measures for *L. monocytogenes* are contained in a prerequisite program other than a Sanitation SOP, the establishment must ensure that the program is effective and does not cause the hazard analysis or the HACCP plan to be inadequate. The establishment should document its antimicrobial agent or process, its implementation and its verification results sufficiently in order to show that the HACCP plan is adequate in controlling the pathogen. The establishment must verify that the antimicrobials are effective by testing for *L. monocytogenes* and have the verification results whether from carrying out its HACCP plan, or Sanitation SOP, or other prerequisite program, available upon request to FSIS. If an establishment produces a product under Alternative 2 by using an antimicrobial agent or process that suppresses or limits the growth of *L. monocytogenes* in its product, it should maintain sanitation in the post-lethality environment in accordance with part 9 CFR 416. The sanitation program must include testing

for food contact surfaces in the post-lethality environment to ensure that the surfaces are sanitary and free of L. monocytogenes or its indicator organisms (Listeria spp. or Listeria-like organisms). Studies on antimicrobials showed growth inhibition of L. monocytogenes if present at low levels of contamination during the shelf life of the RTE product. Antimicrobials were not shown to be effective at higher levels of contamination, so an effective sanitation program, which includes verification testing for food contact surfaces, should be implemented at the same time that antimicrobials are used. The sanitation program must provide for testing food contact surfaces in the post-lethality processing area to ensure that surfaces are sanitary and free of L. monocytogenes or its indicator organisms. It must include the frequency of testing and identify the size and location of the sample sites to be sampled. It must include an explanation of why the testing frequency is sufficient to ensure that effective control of L. monocytogenes or its indicator organisms is maintained. In addition, the establishment must identify the conditions under which the establishment will implement hold-and-test procedures following a positive test for L. monocytogenes or its indicator organisms. The product produced with an antimicrobial agent or process will be subject to more frequent FSIS verification testing compared to a product using a post-lethality treatment to eliminate L. monocytogenes.

3. Alternative 3 Under Alternative 3, the establishment does not apply a post-lethality treatment or an antimicrobial agent or process to control the growth of L. monocytogenes in the postlethality exposed product. An establishment producing this type of product must control the pathogen in its post-lethality processing environment through the use of sanitation control measures, which may be incorporated in the establishment\u2019s HACCP plan, Sanitation SOP or prerequisite program. Because the establishment is not relying upon a post-lethality treatment or an antimicrobial agent or process to control L. monocytogenes, the product will be subject to frequent FSIS verification testing compared to the other alternatives. Examples of products in this alternative are fully cooked meat and poultry that are packaged and refrigerated such as hotdogs, deli meats, chicken nuggets, or chicken patties that did not receive any post-lethality treatment or antimicrobial agent or process. For this alternative, the establishment must maintain sanitation in the post-lethality processing environment in accordance with 9 CFR 416. The sanitation program must provide for testing food contact surfaces in the post-lethality processing area to ensure that surfaces are sanitary and free of L. monocytogenes or its indicator organisms. The testing program should include the frequency of testing, identify the size and location of the sample sites and include an explanation of why the testing frequency is sufficient to ensure that effective control of L. monocytogenes or its indicator organisms is maintained. In addition, the establishment should identify the conditions under which the establishment will implement hold-and-test procedures following a positive test for L. monocytogenes or its indicator organisms on a food contact surface. Recommended testing frequencies are discussed in the Sanitation section G VII-1. Moreover, an establishment that produces a deli product or a hotdog product must verify that the corrective actions that it takes with respect to sanitation after an initial positive test for L. monocytogenes or its indicator organisms on a food contact surface in the postlethality processing environment are effective. The corrective action must indicate steps that the establishment will take to clean and sanitize the suspected food contact surfaces to eliminate the contamination. The effectiveness of the corrective action can be verified by follow-up testing that includes a targeted test of the specific site on the food contact surface

area that is the most likely source of contamination by the organism and other additional tests in the surrounding food contact surface area as necessary. During this follow-up testing, if the establishment obtains a second positive test for L. monocytogenes or an indicator organism, the establishment must hold lots of product that may have become contaminated by contact with the food contact surface until the establishment 17", "Updated Compliance Guidelines May 2006 corrects the sanitation problem indicated by the test result. If the food contact surface is positive for L. monocytogenes, the affected product lot (product that had direct contact with the food contact surface) would be considered adulterated. Affected product (product or food contact surface tested positive for L. monocytogenes) must be recalled, if in commerce, and destroyed or reworked with a process that is destructive of L. monocytogenes. If the food contact surface is positive for Listeria spp. or Listeria-like organisms (indicator organisms), the affected products are not considered adulterated. Establishments may move production from an affected line provided the new production line does not include the food contact surfaces that tested positive for L. monocytogenes and the new food and non-food contact surface areas are tested. In order to be able to release into commerce the lots of product that may have become contaminated with L. monocytogenes from the positive food contact surface, the establishment must sample and test the lots for L. monocytogenes or its indicator organism using a sampling method and frequency that will provide a level of statistical confidence that ensures that each lot is not adulterated with L. monocytogenes. The ICMSF (International Commission on Microbiological Specifications for Foods) statistical sampling plan is an example of a plan that some establishments have used (Attachment 5). If the held product tests positive for L. monocytogenes, the sampled product lot is considered adulterated and must be withheld from commerce. The establishment must destroy the held product, or rework the held product using a process that is destructive of L. monocytogenes. The establishment must document the results of the testing and the disposition of the product. An example of a hold-and test scenario can be found in section G-VII-4 or in Attachment 6. Products and the processing environment under Alternative 3 are likely to be subject to more frequent verification testing by FSIS than products and the processing environment in Alternative 1 or 2. This is because the products in Alternatives 1 and 2 are formulated and\or processed to reduce or eliminate L. monocytogenes or limit its growth in the RTE product and present a lower risk than products in Alternative 3 that do not have these interventions. Likewise, an establishment in Alternative 3 that produces deli meat or hotdog products is likely to be subject to more frequent verification testing than one that does not produce such products because deli and hotdog products were ranked as higher risks for L. monocytogenes contamination in the FDA\FSIS risk assessment. In determining the frequency of verification sampling, the Agency expects to take into consideration the level of pathogen reduction achieved by the post-lethality treatment, the growth inhibition achieved by the antimicrobial agent or process during the shelf life of the product, and the rigor of the sanitation and testing program, i.e., whether the sanitation and testing program exceeds the compliance guidelines. Products considered as deli and hotdog Like all RTE products exposed to the processing environment, deli and hotdog products that are exposed to the post-processing environment are subject to this rule. If the RTE 18", "Updated Compliance Guidelines May 2006 product is not exposed to the post-processing environment, it is not subject to this rule. Depending on the method that an establishment chooses to control L. monocytogenes contamination in its processing, deli and hotdog products may be in Alternative

1, 2, or 3. Deli and hotdog products that receive a post-lethality treatment and antimicrobial agent or process fall under Alternative 1. An example is a hotdog that includes lactates or diacetates in the formulation and is steam pasteurized after repackaging. Deli and hotdog products with antimicrobial agents such as lactates or diacetates added in the formulation, but with no post-process lethality treatment would fall under Alternative 2. Another example of an Alternative 2 product is a hotdog product that received only a post-lethality treatment such as being packaged in casings with an antimicrobial agent that reduces the level of *L. monocytogenes*. If an establishment does not use a postlethality treatment or an antimicrobial agent or process in the processing of deli and hotdog products, these products would fall under Alternative 3. Deli salads are also RTE post-lethality exposed, so they are covered by the rule. Deli meats that are used in salads receive additional handling after they are removed from their packages, and are mixed with other ingredients, thus exposing them to crosscontamination. An establishment producing deli salads with the meat and poultry components that receive a post-lethality treatment or antimicrobial agent needs to have supporting documentation showing that the antimicrobial action is sufficient to control *L. monocytogenes* in all the salad ingredients if they choose to have their product in Alternative 1 or 2. A deli salad with a final pH below 4.39 in all ingredients of the salad, (e.g. due to the salad dressing or other ingredients added) would fall under Alternative 2, using an antimicrobial agent. A cook-in-bag product such as cooked ham or poultry roll that is shipped intact in its cooking bag is not covered by the rule. If the cook-in-bag product sold to a deli is not removed from the bag in the deli but sold to the consumer in the original cooking bag, then it is not considered post-lethality exposed, and therefore is not covered by the Listeria rule. It is also not considered a deli product because simply selling a product in a deli does not result in a product that is defined in 9 CFR 430 as a deli product. However, if it is sold to an establishment where it will be sliced and served in a sandwich or sold to the consumer, it is considered as a deli product. Cooked chicken filets that are sliced or cut in strips, and frozen are covered under the rule since they are post-lethality exposed when sliced or cut. If these frozen products are shipped frozen, they fall under Alternative 2, using an antimicrobial process. If these products were refrigerated and shipped refrigerated, these will fall in Alternative 3. C. Enhanced Level of Effectiveness of the Post-Lethality Treatment and the Antimicrobial Agent or Process Products that receive a post lethality treatment achieving at least 2.0 log reduction of *L. monocytogenes* may likely be sampled less frequently by FSIS than products that receive a post-lethality treatment achieving <2.0 log reduction. Post lethality treatment achieving <1.0 log reduction will likely not be considered a post-lethality treatment for Alternatives 19", "Updated Compliance Guidelines May 2006 20 1 and 2 for purposes of the rule nor likely be eligible to apply for the labeling claim regarding enhanced protection from *L. monocytogenes* without supporting documentation that demonstrates this level of reduction provides a sufficient safety margin. In this case, the product will be viewed by the Agency as produced under Alternative 2 or 3, depending on whether the establishment uses an antimicrobial agent or process in addition to the post-lethality treatment Likewise products receiving an antimicrobial agent or process that suppresses growth of *L. monocytogenes* such that there is 1.0 log or less increase during its shelf life may be expected to be sampled less frequently than products receiving an antimicrobial agent or process that allows the growth of *L. monocytogenes* by greater than 1.0 log increase during its shelf life. Use of an antimicrobial agent or process that allows more than

2.0 log growth increase during shelf life may not be considered an antimicrobial agent or process for Alternatives 1 and 2 for purposes of this rule unless there is supporting documentation that demonstrates that this level of growth provides a sufficient safety margin. In such cases, the product may be moved to a higher risk Alternative. In addition, products that allow greater than 1.0 log growth of the pathogen during its shelf life will not likely be eligible to apply for the labeling claim regarding enhanced protection from *L. monocytogenes*. In this case, the product may also be moved to a higher risk Alternative. The Agency will do the least amount of verification, including sampling, within the Alternative, of 1) products that include processes using extrinsic and intrinsic characteristics of freezing below -0.4°C (31.3°F), pH below 4.39 or water activity below 0.92 and have been demonstrated to not support the growth of *L. monocytogenes*; and 2) products that are formulated to prevent the growth of *L. monocytogenes* in the event of a post-lethality contamination. This means that the effect of the antimicrobial agent/process is effective in limiting growth not only at the time of packaging and during the shelf life of the intact product but also in the event that the package integrity is compromised or the product is sliced at retail. The document should show validation and documentation of the effectiveness of the antimicrobial agent or process for these scenarios. The chart below shows examples of levels of control that establishments could achieve with regards to post-lethality treatment and antimicrobial agent or process for Alternatives 1 and 2. Establishments should use these levels to base their minimum verification measures in determining the effectiveness of their controls.", "Updated Compliance Guidelines May 2006 Expected Levels of Control for Post-lethality Treatments and Antimicrobial Agents or Processes Levels of reduction or inhibition achieved to control *L. monocytogenes* Higher Level1 Lower level2 Not Eligible3 Post-lethality => 2 < 2 < 1 Treatment ( $\log_{10}$  (equal to or (less than 2) (less than 1) reduction of *L. greater than 2) moncytogenes) Antimicrobial Agent  $\leq 1 > 1 > 2$  or Processes ( $\log_{10}$  (less than or (greater than 1) (greater than 2) allowed increase of equal to 1) *L. moncytogenes*) 1Relatively less sampling by FSIS 2Relatively more sampling by FSIS 3Unless there is supporting documentation D. Labeling Antimicrobial agents that are added to RTE products, either to the formulation or to the finished RTE product, and those that are included in the primary packaging material of RTE products must to be listed in the ingredients statement of the product label. In addition, establishments that use a post-lethality treatment or an antimicrobial validated to effectively eliminate or reduce *L. moncytogenes*, or suppress or limit its growth in the product, can make claims or special statements on the labels of their products regarding the presence and purpose of use of the substances. The purpose of such claims is to inform consumers about measures taken by the processor to ensure the safety of the product and enable consumers to make informed purchase decisions. Such claims are voluntary and may be of value to consumers especially those in groups most vulnerable to foodborne illness. Processors need to document their validation of these claims. An example of a statement that can be made is: \u201cPotassium lactate added to prevent the growth of *L. moncytogenes*. \u201d All labeling claims and label changes to add such claims must be submitted for evaluation and approval to the FSIS Labeling and Consumer Protection Staff. Labeling Issues Generic label approval and the new use of approved or listed safe and suitable antimicrobial agents. An establishment does not need to submit a label to the Agency for evaluation and approval when it adds an antimicrobial agent (e.g., sodium diacetate) that is approved or listed by FDA and FSIS as safe and suitable to a product formulation, provided the*

label can be approved in accordance with the generic labeling regulations in 9 CFR 317.5 and 381.133, (i.e., the product must have a standard of identity in Title 9 of the Code of Federal Regulations (CFR) or the Food standards and Labeling Policy Book and the labeling must not bear special claims, guarantees, or foreign language). All 21", "Updated Compliance Guidelines May 2006 22 ingredients including antimicrobial agents require declaration on the label. Establishments may submit for temporary approval to use existing stocks of labels with revised formulations (up to six months) in order to update and produce new labels. Approval of labels bearing claims. As with all claims on labels, if there is a labeling claim about the use of antimicrobial agents or lethality treatments, the labels must be submitted to the Agency for evaluation and approval before use. Documents for validation of the effectiveness of the post-lethality treatment or antimicrobial agent must be included with the label application. An establishment cannot put labeling claims of enhanced protection on RTE products that are not post-lethality exposed, such as cookin-bag that are opened only by the consumer, because these are not covered by the Listeria rule. Antimicrobial agents in comminuted beef products. The standard of identity for ground beef, chopped beef, and their cooked versions, does not provide for the addition of ingredients with the exception of non-fluid condimental seasonings, e.g., salt, pepper. Therefore, these products cannot be formulated with or treated with antimicrobial agents that are classified as having a lasting technical effect, e.g., sodium lactate and sodium diacetate, unless these products are descriptively labeled to reflect the use of the antimicrobial agents. For example, if sodium lactate was added, the product name on the label should be \u201cGround Beef with Sodium Lactate\u201d. However, for beef patties, which are standardized products, the regulations permit the addition of ingredients such as, antimicrobial agents. Therefore, comminuted beef products formulated with antimicrobial agents and other approved or listed safe and suitable food ingredients can be labeled as \u201cbeef patties\u201d and can be generically approved if the labeling does not bear any special claims, guarantees or foreign language. The labeling for other products with standards of identity that permit the addition of antimicrobial agents, e.g., luncheon meats, hotdogs, cooked whole muscle cuts (such as roast beef), may be approved in accordance with the regulations on generic label approval to reflect the addition of new, approved safe and suitable antimicrobial agents on labeling. The addition applies provided that no special claims or guarantees, foreign language, appear on such labels, per the generic labeling regulations. Reclassification of products that are RTE as NRTE Some products are expected to be lethality treated and RTE as shipped, as a matter of their common or usual identity, e.g., pates. Other products are defined by a standard of identity as RTE, that is, cooked, e.g., hotdogs. Some products are RTE based on labeling features, including Nutrition Facts, which declare nutrients in a product on a ready to serve or ready to eat basis. When these factors do not prevail, manufacturers may decide to reclassify products that have long been marketed as RTE products to NRTE products by doing the following: (1) decide on the HACCP category that best fits their product based on the processing operations that are involved. In the situation where a product has been produced as a", "Updated Compliance Guidelines May 2006 RTE product and it is not a product that is defined by common or usual identity (e.g., pepperoni) or standard of identity (e.g., hotdog) as a lethality-treated (e.g., cooked\fermented\dried) product, the manufacturer can re-characterize their product in terms of HACCP category. The manufacturer would need to ensure that documentation exists to support the HACCP category selected by the establishment for the

product and that the appropriate category is reflected in the HACCP plan and labeling records; (2) generate data that validate the cooking instructions that must appear on the labeling of NRTE products (and include in all the alternative methods of cooking temperature that the product must reach, i.e., 160°F) to ensure that consumers provide the lethality step. When the product has historically been viewed by the consumers as a "heat and eat" type of product, it is especially important for the establishment to make the distinction between the RTE product and the NRTE product. In addition, the "cooking instructions" should not be the same "heating" instructions that were previously used on labeling for the RTE products. Cooking instructions would need to include the internal temperature to which the product is expected to reach for the consumer to eat the product safely. (3) assess the label to ensure that it adequately reflects the features that are necessary on the principal display panel to convey that the product is a ready to cook product, e.g., "cook and serve," "cook and eat," "cook thoroughly," as well as safe handling instructions. The basis for the Nutrition Facts declarations, e.g., serving size, must be on a ready-to-cook basis, not on a ready-to-serve basis (the company has to establish a ready- to-cook basis for serving size if the regulations do not provide one). (4) consider whether the label for the product can be approved consistent with the regulations on generic label approval (i.e., it is a label for a standardized product and that bears no claims, special statements, guarantees, or foreign language) -- such labels would not need to be sent to the Agency to be evaluated and approved prior to use. If a meat or poultry product that is processed to a time\temperature that traditionally is considered to attain a full cook but the intended use of the product is such that the product is intended to receive a lethality treatment by the consumer, the product does not have to be labeled as RTE unless the product is defined by a standard of identify as a RTE product (e.g., hotdogs, franks, pork with barbecue sauce, etc.). Such product may be identified as a NRTE product provided that the labeling and validated cooking instructions are adequate to discern that the product must be cooked for safety by the purchaser. An example of such product is a cooked thick-sliced, center-cut ham slice on which the labeling indicates that the product is ready to cook and for safety the product must be cooked to attain a minimum temperature. On the other hand, a thin sliced ham product in case-ready packaging states that the product is ready-to-eat without additional cooking and which would not be required to bear preparation\cooking instructions. Both products may have been processed in the same manner in the Federal establishment but handled differently regarding controls for L. monocytogenes. 23", "Updated Compliance Guidelines May 2006 Furthermore, some establishments also add a "cooking" statement on the label on a fully cooked, RTE product for consumers to cook to a specific temperature. In this case, the establishment is adding heating rather than cooking instructions on the label in order to specify the temperature to which the product must be heated for palatability. In this case, the establishment does not need to have cooking instructions that have been validated to eliminate or reduce pathogens, nor does it need safe handling instructions on the label and the other requirements mentioned above.

E. Production Information Collection An establishment that produces post-lethality exposed RTE products shall provide FSIS with estimates of annual production volume and related information for the types of meat and poultry products processed under Alternatives 1, 2, or 3 (9 CFR 430.4(d)). The establishment needs to provide the information at least annually, or more often, as determined by the Administrator. The Agency regards production volume as a

more important risk factor than establishment size and therefore needs these data so that it can target its resources on higher volume operations in its verification program. FSIS will develop sampling frequencies for the establishments and the products based on these data. When sufficient data have been gathered (at least a year from implementation of the rule), the Agency expects to have the sampling frequency available to the establishments so that they will have an indication of how the risk of *L. monocytogenes* is tied to verification sampling. The form by which to collect the data will be available to establishments in paper and electronic formats. An electronic form for this purpose will be available to the establishments at all times after the rule becomes effective. A sample form for the Production Information on Post-Lethality Exposed Ready-to-Eat Products collection can be found in Attachment 3. F. New Technology Review FSIS believes that the facilitation of the use of new technology represents an important means of improving the safety of meat, poultry and egg products. The Agency defines \u201cnew technology\u201d as new, or new applications of equipment, substances, methods, processes, or procedures affecting the slaughter of livestock and poultry, and processing of meat, poultry and egg products. The Agency has an interest in new technology if new technology could affect product safety, inspection procedures, or inspection program personnel safety, or if it would require a waiver of a regulation. Substances used as new technology must also meet the requirements for safety and suitability under the Agency\u2019s food ingredient approval process. While FDA has the responsibility for determining the safety of food ingredients and additives, as well as prescribing safe use, FSIS has the authority to determine that new ingredients and new uses of ingredients are suitable for use in meat and poultry products. The FSIS New Technology Staff reviews new technology that can be applied in meat, poultry, and egg processing and inspection to facilitate the introduction of the new technology in establishment or plant operations. New technology for use on post-lethality 24", "Updated Compliance Guidelines May 2006 RTE meat and poultry products to control the growth of *L. monocytogenes* should be sent to this office for review. FSIS issued the document on \u201cGuidance Procedures for Notification and Protocol Submission of New Technology\u201d

([www.fsis.usda.gov/Regulations\\_&\\_Policies/New\\_Technologies/index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/New_Technologies/index.asp)) to aid in the submission of application for review of new technology. New technologies received and reviewed by FSIS, which FSIS has \u201cno objection\u201d to their use in FSIS establishments are posted on the web site:

[http://www.fsis.usda.gov/regulations\\_&\\_policies/New\\_Technology\\_Table/index.asp](http://www.fsis.usda.gov/regulations_&_policies/New_Technology_Table/index.asp). G. Sanitation Guidelines for Listeria monocytogenes Control of *L. monocytogenes* is a challenge to a processing plant\u2019s sanitation program. The pathogen can grow in a damp environment, attach to surfaces that come into contact with raw or finished product, establish a niche and form biofilms. The sanitation program should include cleaning and sanitizing procedures that have been proven effective for the particular operation, separation of raw and RTE processing areas, traffic control, employee hygiene, and equipment flow and design among others. Proper and effective sanitation involves both cleaning and sanitizing, and verifying that the cleaning and sanitizing were effective. This involves developing and implementing written sanitation standard operating procedures (Sanitation SOPs). Sanitation SOPs could be viewed as the first step to designing a total system, including the HACCP plan that will prevent, eliminate, or reduce the likelihood of pathogenic bacteria from entering and harboring in the plant

environment. The Sanitation SOPs as described in 9 CFR 416.12 through 416.16, give detailed requirements for developing and implementing the sanitation program, while 9 CFR 416.17 describes how FSIS will verify that each establishment is meeting the Sanitation SOP regulations. In brief, the regulations require the following:

- \u2022 Development of Sanitation SOPs (416.12) \u2013 Each establishment must develop a written Sanitation SOP that describes all sanitation procedures that will be performed each day, before and during operations, with specific frequencies of each procedure and the responsible person for each task. It must also describe the cleaning process for all food contact surfaces, utensils, and equipment used to process your product(s). This document must be signed and dated by either the person responsible for the overall sanitation operations or a higher level employee in the establishment once it is implemented, and when any changes are made to the Sanitation SOPs.
- \u2022 Implementation of SOPs (416.13) \u2013 All preoperational procedures identified in the Sanitation SOP must be done daily, before processing operations start. Each procedure must be performed at the specified frequency and they must be monitored daily.
- \u2022 Maintenance of Sanitation SOPs (416.14) \u2013 Each establishment must routinely determine if the written Sanitation SOP is still effective in preventing direct product contamination and adulteration. If the Sanitation SOP is determined not 25", "Updated Compliance Guidelines May 2006 to be effective because of changes in equipment, utensils, facility, operations, or personnel, changes in the procedures must be made to reflect changes
- \u2022 Corrective Action (416.15) \u2013 The appropriate corrective action(s) must be taken when it has been determined by FSIS or by an establishment employee that the written Sanitation SOP has failed to prevent direct product contamination or adulteration of product(s).
- \u2022 Recordkeeping Requirements (416.16) \u2013 Daily records must be maintained that describe how the sanitation activities were implemented and monitored, and all corrective actions taken; these records must be initialed and dated. Both computer records and paper records are appropriate; however, additional controls may be needed to ensure the integrity of the electronic data.
- \u2022 Agency Verification (416.17) \u2013 FSIS will verify the effectiveness and adequacy of the written Sanitation SOPs to ensure that they meet all of the regulatory requirements. This will be done by reviewing all records, direct observations, and microbial testing as deemed necessary.

In addition to the Sanitation SOP required by FSIS, the Listeria rule requires an additional sanitation program targeting Listeria monocytogenes.

#### I. General Cleaning and Sanitation Procedures

An example of equipment and processing room cleaning using eight steps is outlined below. Cleaning should be increased and intensified during periods of construction.

1. Remove waste material. Dry clean equipment, conveyor belts, tables, floors to remove meat particles and other solid debris. Some equipment such as slicers and dicers need to be disassembled so that parts can be cleaned thoroughly. Equipment may need to be cleaned and sanitized again after re-assembly.
2. Wash and rinse floor.
3. Pre-rinse equipment (rinse in same direction as product flow). Pre-rinse with warm or cold water \u2013 less than 140\u00b0F (hot water may coagulate proteins or \u201cset soils\u201d).
4. Clean and scrub equipment. Always use at least the minimum contact time for the detergent/foam. Written instructions should be provided on the location of possible niches and the cleaning method to use.
- CAUTION: Live steam for cleaning is not acceptable at this step since it may bake organic matter on the equipment.
5. Rinse equipment (rinse in same direction as product flow).
6. Visually inspect equipment to identify minute pieces of meat and biological residues (repeat steps 3 and 4 if not

clean visually or by testing such as with ATP bioluminescence). 7. Sanitize floor and then equipment to avoid contaminating equipment with aerosols from floor cleaning. Care should be taken in using high pressure hoses in cleaning the floor so that water won't splash on the already cleaned equipment. Use hot water, at least 180°F, for about 10 seconds to sanitize equipment. Sanitizers (e.g., chlorine, quaternary ammonia, etc.) may be more effective than 26", "Updated Compliance Guidelines May 2006 steam for L. monocytogenes control. If steam heating equipment in an oven or tarp, the target internal temperature is 160°F and hold for 20-30 min. Portable high-pressure, low volume cleaning equipment (131°F (55°C) with 20-85 kg/cm<sup>2</sup> pressure and 6- 16 liters/minute) can also be used. 8. Remove excess moisture. This can be done most safely and efficiently by air drying. Reduced relative humidity can speed the process. Avoid any possible cross-contamination from aerosol or splash if a method other than air drying (e.g., using a squeegee or towel) is used. If cross-contamination is suspected, repeat steps 4-7.

II. Determining the Effectiveness of Sanitation Standard Operating Procedures (Sanitation SOPs)

The establishment should determine if the cleaning and sanitizing procedures it uses are effective by visual examination or testing or both. Three examples of visual examination or visual examination and testing are described below.

1. Visual inspection of the equipment and environment. Visual inspection is the minimum means of determining the effectiveness of the sanitation SOPs. It can only detect observable contamination.
  - a. Before the start of operation, visually verify that no meat or product residue is on the equipment, especially those food contact surfaces and areas that may serve as niches for bacteria.
  - b. Record the results of the visual inspection.
  - c. If any residue is noted, corrective action should be taken and recorded.
  - d. The monitoring record should be designed to show any trends of insanitary conditions. For example, if corrective action had to be taken on the first two days of operation for more than a week, this indicates a possible problem with cleaning and would have to be investigated to determine the source of the problem (e.g., improperly trained crew on those days, types of products processed).
  - e. Visually verify that no meat or product residue is on the equipment, especially those food contact surfaces and areas that may serve as niches for bacteria, after post-processing cleanup.
2. Visual inspection and use of ATP bioluminescence testing. Visual verification combined with ATP testing can determine both observable contamination and contamination from bacteria and meat/poultry residues that may not be visually detectable. The combined methods are more effective in determining the effectiveness of the sanitation SOP.
  - a. The ATP test indicates the presence of both bacteria and meat or poultry residues and can be used to verify that no meat or poultry residue is on the equipment, esp. those food contact surfaces and areas that may serve as niches for bacteria, before the start of operation. The ATP test is a rapid test and results are available immediately.
  - b. Record the results of the ATP test and visual inspection.
- 27", "Updated Compliance Guidelines May 2006
- c. If any residue is noted or observed visually or the ATP test indicates an insanitary condition, corrective action should be taken and recorded.
- d. The monitoring record should be designed to show any trends of insanitary conditions. For example, if corrective action had to be taken on the first two days of operation for more than a week, this indicates a possible problem with cleaning and would have to be investigated to determine the source of the problem (e.g., improperly trained crew on those days, types of products processed).
3. Visual inspection and total plate counts (TPC). Visual verification combined with TPC can determine both observable contamination and the level of bacterial

contamination. Since TPC results are available in about 24 hours, and cannot be obtained at the time of inspection, its value lies in the measurement of the level of contamination. The level of contamination may assist the establishment in determining the source of contamination and the effectiveness of the sanitation SOP.

- a. Visually verify that no meat or product residue is on the equipment, esp. those food contact surfaces and areas that may serve as niches for bacteria, before the start of operation.
- b. Use swabs or RODAC plates for sampling food contact surfaces, non-food contact surfaces (e.g., push-button on\off switches for the conveyor belt), and the processing environment.
- c. Record the results of the visual inspection.
- d. If any residue is noted, corrective action should be taken and recorded.
- e. Record the TPC when analysis is complete.
- f. The monitoring record should be designed to show any trends of insanitary conditions as determined by visual inspection or TPC. For example, if corrective action had to be taken on the first two days of operation for more than a week, this indicates a possible problem with cleaning and would have to be investigated to determine the source of the problem (e.g., improperly trained crew on those days, types of products processed).
- g. Visually verify that no meat or product residue is on the equipment, especially those food contact surfaces and areas that may serve as niches for bacteria, again after post-processing cleanup.

III. Traffic Control Controlling the movement of personnel and raw and finished products will help prevent cross-contamination of finished products by raw materials and personnel. The following are steps that can be taken for traffic control:

- 1. Establish traffic patterns to eliminate movement of personnel, meat containers, meat, ingredients, pallets and refuse containers between raw and finished product areas.
- 2. Control traffic into and within the RTE areas

  - a. If possible, use air locks between raw and RTE areas.
  - 28", "Updated Compliance Guidelines May 2006
  - b. Clean, dry floors are preferable to foot baths at the point of entry because effective concentrations of disinfectant are difficult to maintain and may become a source of contamination.
  - c. If foot baths are used:
    - i) Wear rubber or other non-porous boots.
    - ii) Maintain them properly,
    - iii) Solutions should contain stronger concentrations of sanitizer than normally used on equipment (1) For example, 200 ppm iodophor, 400-800 ppm quaternary ammonia compound).
    - (2) CAUTION: Chlorine is not recommended as it is too quickly inactivated esp. if cleated boots are used. The accumulation of biological material adhering to the cleats inactivate (or reduce) the bioavailability of chlorine and make it less effective. Monitor and maintain its strength if used.
    - iv) Use a minimum depth of 2 inches.
  - d. Use foam disinfectant spray on floor for people or rolling stock entering the room.

- 3. Employees should not work in both raw and RTE areas, if possible. If they must work in both areas, they must change outer and other soiled clothing, wash and sanitize hands, and clean and sanitize footwear.

  - a. Use different color smocks or helmets for raw and RTE areas so the workers and garments in the raw and RTE areas are readily distinguishable.
  - b. Remove outer garments (e.g., smocks) when leaving RTE areas.

- 4. Do not allow employees who clean utensils and equipment for raw materials to clean RTE utensils and equipment, if possible. If not possible, there should be a time separation when utensils for raw processing\handling are cleaned after RTE. The tools to clean utensils and equipment for raw materials must be different than those used to clean RTE utensils and equipment. In either case, the intent is to prevent cross contamination of finished product.
- 5. Do not permit maintenance employees in RTE areas during operations if possible, primarily because they may cause direct product contamination or adulteration if they touch or lay their \u201cdirty\u201d equipment hands onto food contact surfaces.

If not possible:

- a.

Consider the need to cease operations until a full cleaning and sanitizing is done, or, b. Maintenance personnel must change outer clothing and any other soiled clothing, use separate tools for raw and RTE areas (or wash and sanitize tools and hands prior to entering RTE areas) and wear only freshly cleaned\sanitized footwear in such areas. 6. Use separate equipment, maintenance tools and utensils for the RTE and raw areas. If not possible, there should be a time separation between raw processing\handling and RTE processing in order prevent cross contamination of finished product. 29", "Updated Compliance Guidelines May 2006 7. Pallets can serve as a source of cross-contamination \u2013 pallets for raw materials should not be used in RTE areas or used for finished product. 8. Drains from the \u201cdirty\u201d or \u201craw\u201d side should not be connected to those on the \u201cclean\u201d or \u201ccooked\u201d side. 9. There are instances when small establishments cannot separate the raw and cooked areas, or separate employees handling raw and cooked products by operating time. In this case, the establishment should plan to process cooked products first, then do a complete clean-up (thorough cleaning and sanitizing) of the processing area, processing and maintenance equipment, and personnel, and then do the raw products. The establishment\u2019s Sanitation SOP and their GMP or prerequisite program should address employee hygiene and traffic control during operation to prevent cross contamination and insanitary conditions. 10. Eliminate standing water which can facilitate the spread of L. monocytogenes into other areas of the plant. Sanitizer boluses can be used to sanitize standing water on a continuing basis.

IV. Employee Hygiene Employee hygiene should be the responsibility of both the individual and management. The employee should be responsible for preventing contamination of food products and the management should be responsible for ensuring the employee is properly trained and maintains good practices.

1. Employee responsibilities and actions should include:

- a. Use a 20 second hand wash, allowing the soap suds to be in contact with the hands for this period of time, after using restroom facilities.
- b. Wash hands before entering the work area, when leaving work area, and before handling product.
- c. If gloves are worn:
  - i. Gloves that handle RTE product must be disposable.
  - ii. Dispose immediately and replace if anything other than product and food contact surface is touched.
  - iii. Dispose of gloves when leaving the processing line.
- d. Remove outer clothing when leaving RTE areas.
- e. Do not wear RTE clothing inside restrooms or cafeterias.
- f. Do not store soiled garments in lockers.
- g. Do not eat in the locker room or store food in lockers because food may attract insects and vermin.
- h. Do not store operator hand tools in personal lockers. This equipment must remain in the RTE area at all times.

2. Management responsibilities should include:

- a. Providing hand washing facilities at proper locations.
- b. Ensuring the employee receives proper hygiene instruction before starting \u2013 use of hand soaps and sanitizers, no-touch dispensing systems, and boot and doorway sanitizing systems.
- c. Developing a system for monitoring employee hygiene practices.
- d. Developing a system for tracking the training, testing, and certification.
- e. Retraining employees before placing back into production if they are absent from the job or have failed to follow acceptable hygiene practices. This will help ensure that the employees are following current, acceptable hygiene habits.

V. Sanitizers Cleaning and sanitizing are vital to any effective sanitation program. Thorough cleaning should be followed by sanitizing. Generally, the cleaning step is to remove all waste materials and soils, and the sanitizing step is to destroy all microorganisms. Careful consideration should be given to selecting both cleaning and sanitizing

solutions. It is important to use solutions that are compatible with the equipment materials, such as stainless steel or heavy plastics, and solutions that are effective in destroying the type of bacteria commonly associated with the type of products produced in the establishment. Rather than relying on a single sanitizer, rotating sanitizers will help prevent the development of microorganisms resistant to a particular sanitizer. The concentration and application processes for all sanitizers approved for use in meat and poultry establishments are referenced in Title 21 Code of Federal Regulations (21 CFR), Part 178.1010. All cleaners and sanitizers commercially available should have at the minimum, the following information either on the label or available on a specification sheet that must accompany the product: 9 Product Description 9 To Use \u2013 Instructions on how to use the product 9 Properties 9 Safety Information Additional information that is sometimes available includes: 9 Benefits 9 Quality Assurance Statements 9 Effectiveness against Listeria. Some manufacturers provide labeling in both English and Spanish, which makes the products more user friendly in various environments. At least one manufacturer also has commercially available color coded products that are easy to associate with a particular cleaning or sanitizing task. Krysinski, L.J., (1992) evaluated the ability of chemical cleaning and sanitizing compounds to remove and\or inactivate surface adherent Listeria monocytogenes from stainless steel and plastic conveyor belts. With respect to the sanitizers, the study showed 31", "Updated Compliance Guidelines May 2006 that resistance of attached cells followed in descending order: polyester\polyurethane, and stainless steel. For the stainless steel, all of the sanitizers were effective in inactivating the adherent Listeria monocytogenes except chlorine and iodophor. None of the biocides were effective in sanitizing the surface of the polyester\polyurethane. The most effective sanitizers in these evaluations were acidic quaternary ammonia, peracetic acid, and chlorine dioxide. The cleaning agents used were effective in removing the attached Listeria monocytogenes for the stainless steel but not effective when used on the polyester\polyurethane chips. When the cleaning agents were followed by a sanitizer, reductions in the microbial load were observed. The study concluded that generally, acidic quaternary ammonia, chlorine dioxide, and peracetic acid were the most effective biocides on attached Listeria monocytogenes, less effective were the mixed halogens and acid anionics, and the least effective were chlorine, iodophors, and neutral quaternary ammonium compounds.

VI. Sources and Control of Listeria monocytogenes Contamination

Listeria monocytogenes may be introduced into the processing environment by construction (perhaps the single most important factor associated with outbreaks), the failure to control sanitation procedures, employee hygiene, movement of supplies and products, or other entry vectors (Mead, 1999; Perl, 2000). The bacterium may be brought in by incoming raw product, processing environment or by employees. It can be transferred from coolers, walls, floors, equipment and construction by direct or indirect contact with the product. Dust generated by construction activities can move throughout the plant on air currents or be transferred by people or equipment traveling through the construction area into other areas of the establishment. A study by De Roin et al., (2003) showed that dust contaminated with L. monocytogenes, once in contact with meat surfaces can survive and grow. Construction or maintenance activities that can result in contamination with L. monocytogenes include removal of drains, removal of floor coatings, removal of a wall or ceiling that has absorbed moisture, movement of potentially contaminated materials through RTE areas or areas that directly connect with RTE processing

areas, and exposure of areas typically not accessible for cleaning. Tompkin (2002) considers the potential of introduction of a new, more virulent strain of *L. monocytogenes* into the environment from an outside source or through disturbance of a harborage site (e.g., the process of replacing floor drains, walls or cooling units) as a greater concern. The following are steps that should be taken to prevent contamination of product with *L. monocytogenes* after cooking:

1. Verify that cooking or other control measures will eliminate *L. monocytogenes*. Most meat products implicated in human listeriosis are contaminated with *L. monocytogenes* after these measures are applied. Undercooking product or other inadequately or improperly verified lethality treatments may introduce *L. monocytogenes* to food contact surfaces or the environment after cooking and before packaging.
- 32", "Updated Compliance Guidelines May 2006
2. Prevent contamination of food contact surfaces and prevent the formation and growth of *L. monocytogenes* in a niche, especially in areas after the lethality step. A niche is a harborage site within the plant that provides an ideal place for *L. monocytogenes* to establish and multiply. Factors involved in the formation of niches include equipment design, construction activities, operational conditions that move product debris into difficult to clean locations, mid-shift cleanup, high pressure during cleaning, and product characteristics that require excessive rinsing. Certain strains can become established in a processing environment for months or years. *L. monocytogenes* can be spread from these sites and re-contaminate food or food contact surfaces between the lethality step and packaging. Examples of reservoirs and harborages of *L. monocytogenes* in RTE processing environment

  - Drains
  - Hollow rollers on conveyors
  - On-off valves and switches
  - Worn or cracked rubber seals around doors
  - Vacuum\air pressure pumps, lines, hoses
  - Cracked tubular rods on equipment
  - Air filters
  - Condensate from refrigeration unit
  - Floors
  - Standing water
  - Open or gully drains
  - Ceilings and over head pipes
  - Overhead rails and trolleys
  - Chiller and passageway walls and doors
  - Chiller shelving
  - Roller guards
  - Door handles
  - Boots
  - Ice makers
  - Saturated insulation (wet or moldy)
  - Trolley and forklifts
  - Compressed air in-line air filters
  - Trash cans
  - Cracked hoses
  - Wet, rusting or hollow framework

- Walls that are cracked, pitted, or covered with inadequately sealed surface panels
- Maintenance and cleaning tools
- Space between close fitting metal-to-plastic parts
- Space between close fitting metal-to-metal parts

- 3. Examine routes taken by products from heat treatment, or other control steps to eliminate *L. monocytogenes*, to final packaging.
- 33", "Updated Compliance Guidelines May 2006
- Typical sites that result in *L. monocytogenes* contamination
- Filling or packaging equipment
- Solutions used in chilling food
- Peelers, slicers, shredders, blenders, brine chill, casing removal system, scales, or other equipment used after heating and before packaging
- Spiral or blast freezers
- Conveyors
- Bins, tubs, or other containers used to hold food for further processing
- 4. Frequently clean sites known to support *L. monocytogenes* using effective cleaning procedures. The following is a recommended frequency for cleaning and sanitizing processing equipment and the plant environment:

- a. Daily
- i. All processing equipment
- ii. Floors and drains
- iii. Waste containers
- iv. Storage areas

- b. Weekly
- i. Walls
- c. Weekly\monthly
- i. Condensate drip
- ii. Coolers
- d. Semiannually
- i. Freezers

- 5. Validate that the cleaning and sanitizing procedures are effective.
- 6. Maintain equipment and repair parts or machinery in a manner to prevent food deposits that are not easily removed with normal cleaning.
- 7. Implement a microbial sampling program to monitor and detect sources of *L. monocytogenes* in the environment. Environmental testing is more effective than product testing alone to monitor and detect Listeria in the environment. For positive test results,

conduct intensified cleaning and other necessary corrective actions. Follow up with intensified and targeted testing of implicated sites.

8. Design a sampling scheme to locate a niche before L. monocytogenes becomes established.

a. Determine the physical area to sample. Use prior experience with processing conditions and observation of cleaning and sanitizing procedures and equipment to determine the most likely source of contamination. For example, the use of high water pressure during cleaning may embed L. monocytogenes into parts of the equipment that are 34", "Updated Compliance Guidelines May 2006 hard to clean effectively. The cleaning and sanitizing procedures also should be monitored to assure that the established procedures are being followed. All surfaces of processing equipment should be sampled but with a bias toward those areas identified as possibly problematic.

b. Take 10 samples per line, with a maximum of 50 samples. The samples should include both food contact and non-food contact surfaces.

c. Review at least the last month of results to determine trends or to revise sampling scheme.

d. When a problem area is detected, take corrective action on the affected processing line as opposed to adjacent lines in the area. Target the area corresponding to the line associated with the findings for intensified cleaning. Contamination is usually line specific unless a vector in the system is present (e.g., an employee contaminates multiple sites; a common surface prior to splitting the lines is contaminated).

Equipment Design Selecting the appropriate equipment (e.g., designs that facilitate cleaning and sanitizing, equipment that easily dismantled for cleaning, durability) enhances cleaning operations and helps to control L. monocytogenes in the plant environment. The following are recommended steps to take when selecting equipment:

1. If possible, develop a team (persons from Quality Assurance, Sanitation, Maintenance, and Production) to evaluate equipment before it is purchased or set specific requirements for plant equipment. The equipment should be easy to clean and sanitize and not have potential L. monocytogenes harborage sites, such as hollow rollers.
2. Have the equipment reviewed by a third-party expert if possible.
3. Select equipment designed to minimize sites on the exterior or interior where L. monocytogenes can grow.
4. Select equipment designed to enhance cleaning.
  - a. All areas and parts should be accessible for manual cleaning and inspection or be readily disassembled.
    - i. Closed conveyor designs are more difficult to clean. Equipment on the processing line should be as easy to clean as possible.
    - ii. Avoid hollow conveyor rollers and hollow framing. If hollow material is used, have a continuous weld seal instead of caulk.
  - 35", "Updated Compliance Guidelines May 2006
  - iii. Select food contact surfaces that are inert, smooth and non-porous.
5. Equipment evaluation
  - a. Thoroughly clean and sanitize equipment prior to using in production. Pathogens can live on surfaces that appear visually clean.
  - b. Operate the equipment for 90 days, then,
  - c. Disassemble to normal daily level, then
  - d. Evaluate visually and microbiologically as the equipment is completely disassembled.
6. Maintain equipment and machinery by adopting regular maintenance schedules.
  - a. Damaged, pitted, corroded, and cracked equipment should be repaired or replaced.
    - i. Repair parts or machinery in a manner to prevent food deposits that are not easily removed with normal cleaning.
    - ii. Use separate tools for RTE equipment only. Sanitize them before and after each use.
  - b. If compressed air is used, maintain and replace in-line filters regularly.
  - c. Use lubricants that contain listericidal additives such as sodium benzoate. L. monocytogenes can grow in lubricants that are contaminated with food particles.
7. Control the Environment During Construction If possible, suspend operations during

construction. Otherwise:

- a. Dust from construction can be difficult to detect and control. Therefore, increased monitoring of product, food-contact surfaces, and the environment is recommended during and after these disruptive events.
- b. Establish negative air pressure in the construction area in order to ensure that air does not flow from the construction area into the plant.
- c. Temporary partitions can be established to protect the undisturbed areas of the plant from construction dust and debris.
- d. Cover any construction debris when moving out of the construction area.
- e. Do not move debris through RTE processing areas or areas that directly connect to RTE processing areas, if possible.
- f. Schedule construction during non-processing hours.

36", "Updated Compliance Guidelines May 2006

- g. Conduct intensified cleaning and monitoring of food contact and environmental surfaces.

8. Control the Environment After Construction

- a. Schedule removal of all construction equipment, barriers, and final debris after production hours.
- b. Perform a thorough clean-up and increased sanitation sampling at pre-operation inspection.
- c. Continue intensified cleaning and monitoring of food contact and environmental surfaces until 3 consecutive negative tests on the food contact surfaces for 3 consecutive days.

VII. Verifying the Effectiveness of the Sanitation Program

Establishments can verify the effectiveness of their sanitation program by testing food contact surfaces (FCS) and other relevant environmental surfaces. This section includes

- a) recommended testing of food contact surfaces to verify the effectiveness of the sanitation program for each alternative from 9 CFR 430,
- b) a guide to testing for Listeria spp. or Listeria-like organisms,
- c) an example of a hold-and-test scenario, and
- d) an example of a Sentinel Site Program.

1. Food Contact Surface and Environmental Testing

The sampling frequencies for food contact surface (FCS) testing suggested below are recommended minimum frequencies. Sampling is required for Alternatives 2 (using antimicrobial agents or processes only) and 3, and recommended for Alternative 1. The sampling frequencies increase from Alternative 1 to Alternative 3 because the control program for *L. monocytogenes* decreases in intensity and effectiveness from Alternative 1 to 3. These frequencies should be increased if there is construction, change in the HACCP plan, roof leaks, or other events that could change or increase the probability of product contamination.

Samples should be taken at least 3 hours after the start of operation or an appropriate time period after all parts of the food handling system are operational because the equipment has to be operational for seeding to occur. Establishments can also develop their own sampling plan based on their operations, or have a processing authority develop a sampling plan. Generally, no more than 5 samples may be composited because when samples are composited, it becomes more difficult to trace the source of contamination. In addition, it is recommended that like or similar surfaces should be composited (e.g., food contact surfaces with other food contact surfaces, etc.). The individual locations for the composite sample should be noted to assist in determining the site of contamination to facilitate follow-up testing in case a positive is obtained. Environmental samples other than food contact surface samples should be sampled by the establishment. This will also assist the establishment in locating potential sources of contamination.

37", "Updated Compliance Guidelines May 2006

The establishment is encouraged to hold all products being tested until the test results are received. This will prevent exposure of the consumer to a potential food hazard. Retaining the product being tested also will eliminate the cost of a recall to the establishment.

- a. Alternative 1 \u2013 Use of a post-lethality treatment and an antimicrobial agent or process that limits growth of *L. monocytogenes*.
- i. Conduct tests of food contact surfaces for *L. monocytogenes*, *Listeria* spp., or

Listeria-like organisms at least twice a year. This low frequency of testing is recommended because the post-lethality treatment and the antimicrobial agent and process are expected to reduce and inhibit the growth of L. monocytogenes in the product.

ii. Sample at least 1 square foot area for each surface, if possible.

iii. Record the test results.

iv. If test results are positive for L. monocytogenes, Listeria spp. or Listeria-like organisms:

- (1) Take corrective action (as specified in the HACCP plan, Sanitation SOP or prerequisite program), which should include intensified cleaning and sanitizing.
- (2) If the FCS test is positive for L. monocytogenes, the product in the sampled lot that came in direct contact with a food contact surface would not summarily be considered adulterated, because the post-lethality treatment should have been validated and thus shown to be effective in eliminating or reducing L. monocytogenes, and documented in the establishment\u2019s HACCP plan.
- (3) Record the corrective actions taken.
- (4) Retest the food contact surface.
- (5) Repeat corrective action and testing until samples are negative for L. monocytogenes, Listeria spp. or Listeria-like organisms.
- (6) Initiate intensified environmental sampling after 2 consecutive positives, because this shows that the contamination was not eliminated by the corrective actions, and that there might be some other serious problems. FSIS will likely be looking at the support documentation following the first positive to see what the establishment did to justify that the product was not adulterated, particularly if there is evidence of harborage. Establishments should be on the preventive and reactive mode.

b. Alternative 2 - Use of a post-lethality treatment or an antimicrobial agent or process that limits growth of L. monocytogenes.

i. If a post-lethality treatment is used, conduct tests of food contact surfaces for L. monocytogenes, Listeria spp., or Listeria-like organisms at least quarterly. This recommended frequency is 2 times that for Alternative 1 because in this case, the product only receives one of the interventions.

- (1) Sample at least 1 square foot area for each surface, if possible.
- (2) Record the test results.

38", "Updated Compliance Guidelines May 2006

(3) If test results are positive for L. monocytogenes, Listeria spp. or Listerialike organisms:

- (a) Take corrective action (as specified in the HACCP plan, Sanitation SOP or prerequisite program), which should include intensified cleaning and sanitizing.
- (b) If the FCS test is positive for L. monocytogenes, the product that came in direct contact with a food contact surface would not summarily be considered adulterated, because the post-lethality treatment should have been validated and thus shown to be effective in eliminating or reducing L. monocytogenes, and documented in the establishment\u2019s HACCP plan.
- (c) Record the corrective actions taken.
- (d) Retest the food contact surface.
- (e) Repeat corrective action and testing until samples are negative for L. monocytogenes, Listeria spp., or Listeria-like organisms.
- (f) Initiate intensified environmental sampling after 2 consecutive positives, because this shows that the contamination was not eliminated by the corrective actions, and that there might be some other serious problems. FSIS will likely be looking at the support documentation following the first positive to see what the establishment did to justify that the product was not adulterated, particularly if there is evidence of harborage. Establishments should be on the preventive and reactive mode.

ii. If an antimicrobial agent is used, conduct tests of food contact surfaces for L. monocytogenes, Listeria spp., or Listeria-like organisms at least quarterly. (Sampling is required in this case).

- (1) Sample at least 1 square foot area for each surface, if possible
- (2) Record the test results.
- (3) Each time a FCS test positive for L. monocytogenes, Listeria spp. or Listeria-like organisms, take corrective action, including intensified cleaning and sanitizing, and retest FCS area.
- (4) If the FCS test is positive for L. monocytogenes, the product

in the sampled lot would be considered adulterated because of the high probability of transfer of the pathogen to the product. (5) If 3 consecutive tests of food contact surfaces are positive for Listeria spp. or Listeria-like organisms: (a) Take corrective action (as specified in the HACCP plan, Sanitation SOP or prerequisite program), which should include intensified cleaning and sanitizing. (b) Record the corrective actions taken. (c) Hold the product. (d) Test product for L. monocytogenes. (e) Retest the food contact surface. (f) Repeat corrective action and testing until food contact surface test results are negative for L. monocytogenes, Listeria spp., or Listerialike organisms. (g) If the test results for the product are positive for L. monocytogenes, 39", "Updated Compliance Guidelines May 2006 (i) Recall the product, if already shipped, and (ii) Destroy the product, or (iii)Re-work the product with a process that is destructive of L. monocytogenes. c. Alternative 3 \u2013 Use of sanitation control measures and testing to prevent contamination of product with L. monocytogenes. (Sampling is required in this case) i. For establishments that produce non-deli or non-hotdog products, tests for L. monocytogenes, Listeria spp., or Listeria-like organisms should be conducted once a month for large, small or very small volume establishments. ii. For establishments producing deli and hotdog products, tests for L. monocytogenes, Listeria spp., or Listeria-like organisms should be conducted at least four times per month per line for large volume establishments, two times per month per line for small volume establishments, and once per month per line for very small (or low) volume establishments. FSIS regards production volume as a more important risk factor than establishment\u2019s size and intends to use volume as one of the primary triggers for when considering its verification activity. For now, regarding deli meat and hotdog operations, FSIS is considering the break point between high volume and low volume to be approximately 1.3 million pounds yearly, as derived from the RTE survey. iii. Sample at least 1 square foot area for each surface, if possible. iv. Record the test results. v. If the first test result of a food contact surface is positive for L. monocytogenes, Listeria spp., or Listeria-like organisms, take corrective actions (as specified in the HACCP plan, Sanitation SOP or prerequisite program) and record. vi. If the FCS test is positive for L. monocytogenes, the product in the sampled lot would be considered adulterated because of the high probability of transfer of the pathogen to the product. vii. Each time a FCS tests positive, take corrective action, including intensified cleaning and sanitizing, and retest FCS area. viii. For establishments producing hotdog or deli meat products, if the second test result of a food contact surface is positive for L. monocytogenes, Listeria spp., Listeria-like organisms: (1) Take corrective action (as specified in the HACCP plan, Sanitation SOP or prerequisite program), which should include intensified cleaning and sanitizing. (2) If the FCS test is positive for L. monocytogenes, the product in the sampled lot would be considered adulterated because of the high probability of transfer of the pathogen to the product. (3) Record the corrective actions taken. (4) Hold the product (see hold-and-test scenario below and in Attachment 6). (5) Test product for L. monocytogenes at a rate that provides a level of statistical confidence that the product is not adulterated. 40", "Updated Compliance Guidelines May 2006 (6) Conduct follow-up test of the food contact surface each day until the test result is negative for Listeria spp., Listeria-like organisms. (7) At the same time, continue to hold each day\u2019s production lot until the test results for the food contact surfaces are negative. (8) If the test results for the product are positive for L. monocytogenes, (a) Destroy the product, or (b) Re-work the product with a process that is destructive to L. monocytogenes. ix. For establishments producing products other than hotdogs

or deli meats, if the third consecutive test of food contact surfaces is positive for Listeria spp., or Listeria-like organism (sampling is required in this case): (a) Take corrective action (as specified in the HACCP plan, Sanitation SOP or prerequisite program), which should include an intensified cleaning and sanitizing. (b) In addition, if the FCS test is positive for L. monocytogenes, the product in the sampled lot would be considered adulterated because of the high probability of transfer of the pathogen to the product. (c) Record the corrective actions taken. (d) Hold the product. (e) Test product for L. monocytogenes. (f) Retest the food contact surface. (g) Repeat corrective action and testing until food contact surface test results are negative for L. monocytogenes, Listeria spp., or Listerialike organisms. (h) If the test results for the product are positive for L. monocytogenes, (i) Destroy the product, or (ii) Re-work the product with a process that is destructive of L. monocytogenes. For repeated FCS positives, the establishment should also conduct a comprehensive investigation to determine the cause and source of the contamination. This establishment should: a. Review the cleaning and sanitizing procedures, including the types of cleaning agents. b. Review traffic control patterns, equipment layout and adherence to employee hygiene procedures. c. Locate niches i. Repeated, non-consecutive positives usually indicate the presence of a niche or harborage site for L. monocytogenes ii. Increase testing of the positive site including individual pieces of equipment to locate the source of the contamination d. Thoroughly clean and sanitize the individual parts. i. Intense scrubbing is necessary to breakup or dislodge a biofilm. ii. A change of cleaning or sanitizing solutions may be indicated. 41", "Updated Compliance Guidelines May 2006 iii. Fogging of the equipment or room with a sanitizer such as quaternary ammonium compounds could be used if problems persist. e. Reassemble and test again during operation until the FCS test negative on consecutive tests. At the same time as the comprehensive investigation, the establishment should examine and review its HACCP plan, Sanitation SOP or its prerequisite program where the sanitation and testing programs are included, evaluate and determine if there is any design or execution flaw, and modify as necessary. The establishment should evaluate the cleaning or sanitizing procedure, the method of verifying that the procedures are performed as prescribed, employee hygiene practices, monitoring traffic patterns, equipment design, or change in processing conditions.

2. Expected Frequencies of Establishment Verification Testing of Food Contact Surfaces for Alternatives 1, 2 and 3

The chart below shows the frequencies of testing food contact surfaces that establishments in Alternatives 1, 2 and 3 should conduct for verification of the effectiveness of their sanitation program. Establishments should consider these frequencies when determining the level of Listeria control they believe is prudent in their establishments based on their operation and historical data. Those establishments assuming these levels of verification testing likely would be subject to more intense verification activity by FSIS, and their vulnerability regarding the scope of a recall likely is increased in situations where product in commerce is linked to their establishment. The scope of a recall is dependent, in part, upon the level and type of documentation that establishment maintains on the on-going effectiveness of their operation.

Expected Frequencies of Establishment Verification Testing of Food Contact Surfaces for Alternatives 1, 2 and 3. Food Contact Surface Testing Higher Frequency Lower Frequency

Alternative	Frequency
Alternative 1	> 2/year/line
Alternative 2	> 4/year/line
Alternative 3	> 1/month/line

Deli, hotdogs: Very Small volume plant > 1/month/line

Small volume plant > 2/month/line

2\month\line Large volume plant > 4\month\line 4\month\line 3. Testing Food Contact Surfaces and Other Environmental Surfaces for Listeria spp. and Listeria-like Organisms RTE meat and poultry establishments perform many different microbiological testing programs, including: 42", "Updated Compliance Guidelines May 2006 43 \u2022 Testing for the presence of Listeria spp. or Listeria-like organisms. These organisms are appropriate for use as indicators of *L. monocytogenes* because their presence indicates the possible presence of the pathogen. If tests for these organisms are negative, it is unlikely that *L. monocytogenes* is present. Tests for Listeria spp. or Listeria-like indicator bacteria are typically abbreviated versions of *L. monocytogenes* methods, terminated after enrichment and screening steps, but before *Listeria monocytogenes* is confirmed, specifically:

- o Tests for Listeria spp. organisms are rapid screening procedures involving genus Listeria-specific immunoassays, genetically-based or other rapid assays, in which a positive result is obtained but not confirmed as *Listeria monocytogenes*
- o Tests for Listeria-like organisms are typical cultural procedures in which potential positives are indicated by biochemical reactions in differential broth or plating media, but are not confirmed as *Listeria monocytogenes* \u2022 Testing methods to enumerate Listeria spp. or Listeria-like organisms. Such methods are appropriate for enumerating the number, but are not sensitive enough for determining the presence or absence of these microorganisms, if present at low levels. Enumeration methods do not include an enrichment period, and therefore are not sufficiently sensitive for the requirements of a testing program designed to detect low numbers of organisms present. In addition, the surface area tested must be factored into the results in order to make a best estimate of the number of organisms present in that specified area. FSIS realizes that there may be circumstances when the establishment chooses to use such enumeration methods for their own purposes. Such techniques are important when trying to ascertain the likely level of contamination that comes into contact with RTE product. However, the establishment must provide scientific justification for any testing methods used for environmental testing, and a rationale for the conclusions derived from such testing. \u2022 Testing for aerobic plate counts (APC), total plate counts (TPC), coliforms, ATP etc. Such tests are not appropriate indicators for *L. monocytogenes* as they cannot establish the presence or absence of this organism. Testing for these organisms is appropriate for monitoring the effectiveness of the sanitation procedures or the level of contamination during processing. To ensure that any potential Listeria spp. or Listeria-like organisms are detected, it is necessary for the method used to provide the lowest possible limit of detection (i.e., maximum sensitivity for detection) for these organisms. Testing methods meeting the following criteria are most likely to be suitable for this purpose: \u2022 The method is used by a regulatory body or has been validated by a recognized independent body (e.g., AOAC, AFNOR, ISO), using the FSIS *Listeria monocytogenes* qualitative method as a reference method. A validated method from a scientifically robust study using the FSIS *Listeria monocytogenes* qualitative method as a reference method is also acceptable but may be subject to FSIS review. The", "Updated Compliance Guidelines May 2006 44 validation procedure should be consistent with the goal of providing sensitive qualitative detection of environmental Listeria, AND \u2022 The method includes an enrichment period that allows for the recovery and resuscitation of any sub-lethally injured cells also allows for the outgrowth (multiplication) of very low numbers of Listeria to levels that can be detected by the test method. In general, direct-plating enumeration methods, which do not include a period for outgrowth of cells and cannot detect

microorganisms at very low levels, are inappropriate for ensuring that Listeria contamination is not present on food contact or other environmental surfaces, AND \u2022 The method must accommodate analysis of the entire sample sponge (or other sampling device), and all associated diluent, to maximize the possibility of detecting any cells that are present. By only analyzing a portion of the diluent or by not testing the sponge or swab, any Listeria remaining in the untested sample portion would not be represented, thereby decreasing the potential for detecting Listeria contamination. Quantitative methods, including direct-plating and most-probable-number methods, typically test only a portion of the diluent and so are inappropriate for ensuring Listeria are not present on food contact or other environmental surfaces. The establishment is responsible for the choice of methods. It is the establishment\u2019s responsibility to share this guidance document with microbiological consultants and testing laboratories so that all parties understand what methods and sample test portions are appropriate for the intended purpose. Also, any methods used should be validated to ensure that they can reliably detect the presence of Listeria spp. or Listeria-like organisms on food contact and other environmental surfaces. In addition, the establishment should maintain documentation related to the selected testing procedure. If an establishment chooses not to use a proven methodology for food-contact and other environmental-surface testing, it may be assuming a greater risk of allowing adulterated product into the marketplace, and therefore being confronted with recall requests and regulatory actions. Should FSIS question the suitability of the method employed by an establishment, it may choose to review the scientific basis for the sampling and testing procedures used. In such a circumstance, the establishment could be subject to focused verification checks, including review of recordkeeping, observation of production, and collection of product and environmental sampling for testing. FSIS method for analysis and confirmation of *L. monocytogenes* and other FSIS microbiology laboratory methods are available and can be downloaded at

[http://www.fsis.usda.gov/Science/Microbiological\\_Lab\\_Guidebook](http://www.fsis.usda.gov/Science/Microbiological_Lab_Guidebook)

4. Hold-and-Test Scenario for Deli and Hotdog Products in Alternative 3 Assuming it takes to 3 days to obtain a test result for Listeria spp., or Listeria-like organisms:","Updated Compliance Guidelines May 2006 Day 1 \u2013 Take food contact surface (FCS) samples Day 4 \u2013 FCS sample (from Day 1) negative for Listeria spp. or Listeria-like organisms. 9 Continue production as the corrective action appears to resolve problem and test FCS as scheduled. If FCS sample positive (from Day 1) for Listeria spp. or Listeria-like organisms. 9 Take Corrective Action (as specified in the HACCP plan, Sanitation SOP or prerequisite program), which should include an intensified cleaning and sanitizing. 9 Test FCS-- target most likely source of contamination, and additional tests in surrounding FCS area 9 Continue production. Day 7 \u2013 Follow-up FCS sample (from Day 4) is negative for Listeria spp. or Listeria-like organisms. 9 Continue production as the corrective action appears to resolve problem and test FCS as scheduled. If follow-up FCS sample (from Day 4) is positive for Listeria spp., or Listeria- like organisms. 9 Take Corrective Action (as specified in the HACCP plan, Sanitation SOP or prerequisite program), which should include an intensified cleaning and sanitizing. 9 Test FCS-- target most likely source of contamination, and take additional tests in surrounding FCS area 9 Hold and test Day 7 product lot (for *L. monocytogenes* or Listeria spp. or Listeria-like organisms). 9 Continue production, hold product from the day\u2019s production Day 8 \u2013 9 Test FCS-- target most likely source of contamination, and take additional tests in surrounding FCS area 9 Hold product from this

day\u2019s production Day 9 \u2013 Test FCS-- target most likely source of contamination, and take additional tests in surrounding FCS area 9 Hold product from this day\u2019s production Day 10 \u2013 If FCS sample (day 7 sample) is negative for Listeria spp., or Listeria-like organisms. 9 Continue production and hold product from days 7, 8, 9 and 10 until the results from Day 7 product testing and Days 8, 9, 10 FCS testing are available and found negative, unless there is compelling justification that affected products are not adulterated. 9 Resume FCS testing according to frequency stated in sanitation program 45", "Updated Compliance Guidelines May 2006 46 If FCS sample (day 7 sample) is positive for Listeria spp., or Listeria-like organisms: \ufffd Hold and test product from day 10 production. \ufffd Test product from days 7, 8, 9, and 10 for L. monocytogenes, Listeria spp. or Listeria-like organisms \ufffd Take corrective action \ufffd Intensive cleaning and sanitizing \ufffd Take FCS sample-- target most likely source of contamination, and additional tests in surrounding FCS area Day 14 \u2013 If Day 7 product is positive for L. monocytogenes, destroy product, or rework product with a process that is destructive of L. monocytogenes. Recall product if already in commerce. If product is positive for Listeria spp., verify that products (Days 7, 8, 9, 10), which may have been exposed to insanitary conditions are not adulterated by testing to provide compelling justification. If the establishment tests FCS samples for L. monocytogenes, and the FCS test positive for the pathogen, the sampled lot is considered adulterated. Every time there is a second or more (consecutive) follow-up FCS positive, product is held and tested for L. monocytogenes. Only product lots implicated with a second or more (consecutive) follow-up FCS positive are held and tested. Every time there is a product positive for L. monocytogenes, product is held, and destroyed or reworked with a listericidal process. Once the FCS testing is negative, implying that the corrective action is working, production is continued. Repeated FCS positives would imply a critical sanitation problem and the establishment needs to conduct intensive testing and intensive cleaning and sanitizing. At the same time the establishment should investigate the cause and source of the contamination and review the documents where the sanitation and testing programs are included to determine if there are design or execution flaws. The establishment should have provisions in their sanitation and testing program for these kinds of situations. A joint industry group has completed guidelines titled \u201cIndustry Best Practices for Holding Tested Products.\u201d This document was designed to encourage all establishments to hold products that are tested for adulterants until the results are received and to assist companies in developing best practices to ensure that they in fact do so. To obtain a copy of this document, visit the International HACCP Alliance website at the following address: <http://haccpalliance.org/alliance/bestpractices.html> 5. Sentinel Site Program Example Some establishments have adopted a sentinel site program for the control of L. monocytogenes in RTE meat and poultry products. A sentinel site program is similar to traditional Listeria control programs \u2013 separate testing programs for the environment and food contact surfaces and increasingly aggressive corrective actions to eliminate Listeria", "Updated Compliance Guidelines May 2006 when it is detected. The distinctive characteristic of this control program is that in the case of a positive Listeria test result for a food contact surface area, the sanitation of that particular area will be included in the HACCP plan as a CCP. The CCP is removed when the establishment determines that the food safety hazard has been eliminated and is not reasonably likely to occur. The CCP is the sanitation program for the particular site and food contact surface sampling as verification of the CCP. If a

food contact surface or non-food contact surface tests positive for Listeria spp. or Listeria-like organisms, testing is intensified in the identified area. 1 If a non-food contact surface sampling site is found to be positive for Listeria spp. or Listeria-like organisms during routine monitoring, intensified sampling is initiated as soon as possible. Under intensified sampling, three samples per day (one each at pre-op, st shift, 2nd shift) are analyzed until a total of nine consecutive samples have been taken and are negative for Listeria spp. or Listeria-like organisms at that particular site. Swabs are analyzed for each day of production. If a sample finding is positive, testing of that site continues until nine consecutive samples are negative for Listeria spp. or Listeria-like organisms. Once nine consecutive samples are found negative, that site will be returned to routine sampling. Similarly, the food contact surface site that initially tests positive for Listeria spp. or Listeria-like organisms will be placed under intensified testing. If nine consecutive samples under the intensified testing are negative for Listeria, that site is returned to routine monitoring. However, if the food contact surface tests positive under the initial intensified sampling, sanitation for that area is designated as a CCP, since Listeria would, at that point be considered a hazard not reasonably likely to occur. The site testing positive for Listeria would be considered a suspect harborage for L. monocytogenes and corrective actions taken. Testing becomes the verification step. 1 Intensified sampling under the CCP requires that 3 samples per day (one each at pre-op, st shift, 2nd shift) be taken until nine consecutive samples are negative for both Listeria spp. and L. monocytogenes. If a sample is positive for Listeria spp. but negative for L. monocytogenes, additional sampling days are added (3 samples per day) until nine consecutive samples are negative for both Listeria spp. and L. monocytogenes. All products that have contact with that particular site must be placed on hold pending test results. If nine consecutive samples are negative for Listeria spp. and L. monocytogenes, the site can be returned to routine sampling. Product can be released when the line and production date receive negative test results for L. monocytogenes. Any sites testing positive for L. monocytogenes would require testing of the product. Sentinel Site Program Example Flowchart 47", "Updated Compliance Guidelines May 2006 1. Routine Environmental Sampling a. 5 samples\line\week i. 3 \u2013 food contact surface samples ii. 2 \u2013 non-food contact surface samples iii. Listeria spp. 2. Non-food Contact Surface Testing a. If negative for Listeria spp., continue Routine Environmental Testing b. If positive for Listeria spp., intensify sampling i. Collect 3 samples\site\day for 3 consecutive days for Listeria spp. (9 consecutive samples) ii. If 9 consecutive samples are negative for Listeria spp., return to Routine Environmental Sampling iii. If any sample is positive, continue sampling 3 samples\site\day until 9 consecutive samples are negative 3. Food Contact Surface (FCS) Testing a. If negative for Listeria spp., continue Routine Environmental Testing b. If positive for Listeria spp., intensify sampling i. Collect 3 samples\site\day for 3 consecutive days for Listeria spp. (9 consecutive samples) ii. If 9 consecutive samples are negative for Listeria spp., return to Routine Environmental Sampling iii. If any sample is positive, make sanitation for that site a CCP 4. CCP Testing a. Collect 3 samples samples\site\day for 3 consecutive days for Listeria spp. and L. monocytogenes (9 consecutive samples) b. If 9 consecutive samples are negative for Listeria spp. and L. monocytogenes, return to Routine Environmental Sampling and eliminate the CCP c. If a sample is positive for Listeria spp. but negative for L. monocytogenes i. Place product on hold ii. Release product if site and production date have negative results for L. monocytogenes iii. Continue testing until 9 consecutive samples are negative for Listeria spp. and L. monocytogenes, then return to

Routine Environmental Sampling and eliminate the CCP d. If any sample is positive for L. monocytogenes, test the product for L. monocytogenes i. Reprocess or destroy product testing positive for L. monocytogenes H. RISK-BASED VERIFICATION TESTING PROGRAM Risk-Based Sampling. Before the implementation of risk-based verification sampling, samples were collected under sampling project codes ALLRTE (all RTE products \u2013 both post-lethality exposed and non-post-lethality exposed), RTERISK1 (product priority list based on FSIS Directive 10,240.4), and RTE001 (establishments are identified for sampling based on risk ranking). For ALLRTE, all establishments, regardless of plant size, production volume, or process design had an equal chance of being sampled each fiscal year. Results from this project were unbiased to the extent that production practices were not addressed as they are in the other RTE verification sampling projects. Overall prevalence of the pathogens, for which FSIS tests, in all types of operations can be ascertained. FSIS randomly collected one sample of product at a time from an individual establishment and tested for pathogens of public health concern, namely, Listeria monocytogenes, Salmonella and E. coli O157:H7. Inspection program personnel carried out HACCP, Sanitation SOPs, and prerequisite program verification activities, including the review of records and laboratory results, to verify that establishment\u2019s are properly addressing the control of pathogens. The implementation of the risk-based verification program consists of two phases. Phase 1 of the risk-based verification testing program was implemented in January 2005 with the issuance of FSIS Notice 61-04 announcing the RTE001 project for testing of postlethality exposed ready-to-eat (RTE) meat and poultry products for L monocytogenes. Project RTE001 was designed to consider the Alternative (i.e., 1, 2. or 3 of 9 CFR 430.4) that the establishment selected for the production of post-lethality exposed products. That is, sampling was based on the risk of Listeria contamination of products produced under the three Alternatives. In Phase 2, this concept was expanded to include testing of food contact surfaces, environmental (non-food contact surfaces), and finished product. As more samples are taken for the RTE001 sampling project, sample project RTERISK1 will be discontinued. The ALLRTE project will still be continued in Phase 2. In Phase 1, a checklist (Procedures for the Evaluation of Establishment Control Programs for Listeria monocytogenes, Attachment 7) was developed to evaluate the effectiveness of the post-lethality treatment, antimicrobial agent or process and the sanitation program used by the establishment to control L. monocytogenes in their post-lethality exposed RTE meat and poultry products. The checklist will be completed by Enforcement, Analysis and Investigative Officers (EAIO) whenever a Food Safety Assessment (FSA) is conducted. Follow-up Sampling. When a sample taken under the sampling projects outlined above is found to be positive for a pathogen, FSIS will conduct follow-up verification testing after the establishment has taken its corrective and preventive actions. The follow-up sampling will be conducted under the Intensified Verification projects, as described below. Intensified Verification Testing. These projects are designed for testing in any operation involving any RTE meat or poultry product, regardless of the establishment\u2019s control procedures, the production volume, etc., due to the production of adulterated product (i.e., the pre-shipment review has been completed), investigative purposes (e.g., as a result of an outbreak of foodborne disease), or concern that the establishment may not be properly controlling for pathogens. The projects may include instructions to Inspection program personnel to collect multiple samples. Intensified verification testing will include: 49", "Updated Compliance Guidelines May 2006 1. Increased

frequency and number of samples taken for product testing (as compared to targeted verification testing), and the collection of environmental samples. 2. Increased FSIS record verification checks regarding the design and implementation of the food safety system. These sampling projects will be scheduled by OFO through OPHS on a case-by-case basis.

- I. Steam Pasteurization and Hot Water Pasteurization Post processing contamination of RTE meat and poultry is mostly confined to the surface. Pasteurization by steam and hot water acts on the surface microbial contaminants by the action of heat. Studies on surface pasteurization using steam or hot water were shown to be effective in reducing this contamination. Studies by Murphy et al. (2003a) showed that post-cook hot water pasteurization and steam pasteurization resulted in a 7 log<sub>10</sub> reduction of *L. monocytogenes* in inoculated vacuum packaged fully cooked sliced chicken. The reduction was effective when single \u2013 packaged breast fillets, 227 g- package strips and 454 g-packaged strips were heat treated at 90 C in a continuous steam cooker or hot water cooker for 5, 25 and 35 minutes respectively. These investigators developed a model called ThermoPro that could predict the thermal lethality of pathogens in fully cooked meat and poultry products during postcook in-package pasteurization (Murphy et al., 2001, 2003b, 2003c). The model was developed using *L. innocua* and verified for *L. monocytogenes*.
- II. Pre-Package Pasteurization and Post-Package Surface Pasteurization Pre-package surface pasteurization treatment of fully cooked meat removed from their packaging

wrap and inoculated with *L. monocytogenes* resulted in a 1.25 to 3.5 log reduction with a treatment time of 60-120 sec at 475 to 750°F air temperature (Gande and Muriana, 2003). Surface pasteurization was applied on cooked whole and split roast beef, whole corned beef, and whole and formed ham using a radiant oven. Pre-package pasteurization (60 sec) combined with post-package submerged water pasteurization using formed ham (60 or 90 sec), turkey bologna (45 or 60 sec), and roast beef (60 or 90 sec), resulted in a 3.2 to 3.9 log reduction for ham, 2.7-4.3 log reduction for bologna, or a 2.0-3.75 log reduction for roast beef. The level of reduction varied depending on the method of inoculation, type of product used, treatment temperature, and residence time. Muriana et al., (2002) used a stainless steel water bath to submerge cooked RTE delistyle whole or formed turkey, ham and roast beef, removed from their package, inoculated with *L. monocytogenes* and vacuum packaged. Results show a 2-4 log decrease in the levels of *L. monocytogenes* in inoculated products post-cooked at 195205°F for 2-10 min. 59", "Updated Compliance Guidelines May 2006 Treatment of processed foods with acidified sodium chloride (ASC) is another example of pre-packaging treatment. ASC is an antimicrobial agent that is approved for use on processed meat food products (unless precluded by standards of identity in 9 CFR 319) prior to packaging of the food for commercial purposes (21 CFR173.325 (f)). It is applied as a dip or spray at levels that result in sodium chlorite concentration of 500 to 1,200 ppm in combination with any GRAS acid at levels sufficient to achieve a pH of 2.5 to 2.9. It is approved as a secondary direct food additive, and considered as a processing aid, with very temporary or short term technical effect (bactericidal antimicrobial activity) after which it rapidly degrades to leave no long term residues or actives remaining (Kemp, Alcide Corp., personal communication, 2003). Because of this, it does not have to be included in the ingredient listing of the label. Marsden et al. (2000, unpublished), evaluated sodium chlorite (1,200 ppm) with 0.9% citric acid for its effectiveness in reducing *L. monocytogenes* on retail Little Smokies sausages. Results show that a water wash gave a 1.2 log cycle reduction of *L. monocytogenes*. An ASC dip for 15 sec provided a 1.0 log cycle reduction better compared to water wash. ASC exposure time of 30 sec gave 1.1 and 1.6 log cycle reductions over the water wash control, for spraying and dipping, respectively. Spray wash or dipping was found to be comparable in antibacterial effectiveness against *L. monocytogenes*.

III. High Hydrostatic Pressure Processing High pressure processing (HPP) is one of the new technologies used for food processing. This technology provides a means of ensuring food safety for those products that are difficult to be heat treated due to organoleptic effects. HPP was shown to inactivate pathogens without any thermal or chemical effects and at the same time preserve the quality of the product. Raghubeer and Ting (2003) evaluated the efficacy of high hydrostatic pressure processing in inactivating *L. monocytogenes* in retail-packaged samples of sliced ham, turkey and roast beef obtained from a manufacturer and repackaged in 25-g portions. Results show that an inoculum of about 10<sup>4</sup> *L. monocytogenes* cocktail in these 3 products and HPP treatment at 87,000 psi for 3 minutes showed no recovery of *L. monocytogenes* after 61 days of storage at 34°F. There were no pressure-injured cells detected. There were no adverse organoleptic effects detected on the 3 HPP treated products during the 61-day shelf life study. No signs of spoilage were seen on all 3 products after 61 days of storage, and for 100 days for ham and turkey. According to the investigators, the normal shelf life of these products is 30 days, so the HPP treatment extended the shelf life of the products.

B. Studies on the Use of Antimicrobial Agents I. Addition of Lactates, Acetates,

Diacetates to Meat Formulations Studies have shown that lactic acid and acetic acid have significant antimicrobial activity in broth and food systems. Sodium and potassium salts of these acids, when added to processed meat formulations are also known to potentially inhibit pathogenic bacteria especially *L. monocytogenes*. These antimicrobials inhibit growth of pathogens by 60%,"Updated Compliance Guidelines May 2006 inhibiting their metabolic activities. Interest in these antimicrobials is in the growth inhibition of *L. monocytogenes* in post lethality exposed RTE meat and poultry products. Several studies used these antimicrobials to show their ability to inhibit growth of *L. monocytogenes* in different meat formulations. Seman et al., (2002) developed a mathematical model capable of predicting the growth or stasis of *L. monocytogenes* in commercial cured meat products using a response surface method. The model can be used by manufacturers in the determination of the appropriate amounts of potassium lactate and sodium diacetate to be added to cured meat products that are organoleptically sensible and will not support the growth of *L. monocytogenes*. Thirty products were formulated by using a variety of raw material sources such as pork trimmings, trimmed turkey breast halves and four-muscle ham. Varying amounts of potassium lactate and sodium diacetate were added to the meat formulation and the meats were processed into different products. After chilling, the products were stripped of their casings, sliced into 25-g slices, placed into pouches, and inoculated with *L. monocytogenes* by applying to the surface of 100g of cured meat (four slices). The results show that increasing amounts of potassium lactate syrup and sodium diacetate decreased the growth rate of *L. monocytogenes*, while increasing finished product moisture increased the growth rate. Sodium chloride content was not significant but was found to have a negative correlation to growth rate. The investigators provided a final regression equation predicting the growth of *L. monocytogenes* in cured RTE meat products stored at 4\u00b0C. The investigators used predictive model performance factors and a simple linear regression analysis to evaluate the model generated in this study. They verified the accuracy of the model by comparing with actual *L. monocytogenes* growth data from an independent challenge study conducted with four different commercial RTE meat products using similar storage conditions. Performance factors calculated and evaluated for control products (those not containing potassium lactate and sodium diacetate) indicated that on the average, the predicted growth of *L. monocytogenes* exceeded those of the observed values by about 24 %. This study provided a useful model in determining the target amounts of potassium lactate and sodium acetate for cured meat product formulations to inhibit the growth of *L. monocytogenes*. The calculations would also require knowledge of the finished product sodium chloride and moisture contents. The investigators advised that this validated model is specific to the products designed for the study and the *L. monocytogenes* strains used. Testing of this model in other environments and with other *Listeria* spp., and to formulations that are outside the model's limits may result in different maximum growth rates. This study was used as the basis for the Opti.Form Listeria Control Model. The Opti.Form Listeria Control Model is a unique tool to calculate the levels of lactate and diacetate required to retard the growth of *Listeria monocytogenes* in cured meat and poultry products. The model is based on the study detailed in the paper by Seman et al, 2002, above. The model, which is available on CD-Rom includes: \u2022 instructions on how to use the model \u2022 explanation on the development of the model 61","Updated Compliance Guidelines May 2006 \u2022 information on the anti-microbial effect of lactate and diacetate \u2022 lactates and diacetates and use of

these products \u2022 regulations and labeling \u2022 literature references To receive a free copy of the model on CD-Rom, call: 888-899 8229, E-mail pam@purac.com Bedie et al., (2001) evaluated the use of antimicrobials, included in frankfurter formulations, on L. monocytogenes populations during refrigerated storage. Fully cooked and cooled frankfurters were inoculated with 103 to 104 CFU /cm<sup>2</sup> of L. monocytogenes after peeling and before vacuum packaging. Samples were stored at 4\u00b0 C for up to 120 days and sampled for testing on assigned days. Results are as follows: ANTIMICROBIAL LEVEL (%) L. MONOCYTOGENES GROWTH INHIBITION Sodium lactate 3 70 days no pathogen growth Sodium diacetate 0.25 50 days no pathogen growth Sodium acetate 0.25, 0.50 20 days no pathogen growth Sodium lactate 6 120 days no growth and reduced pathogen growth Sodium diacetate 0.5 120 days no growth and reduced pathogen growth Inoc. Control 0.0 Increased to 6 logs in 20 days Note: Sodium acetate is approved as a flavor enhancer, not as an antimicrobial agent. No pathogen growth refers to zero increase in the number of inoculated L. monocytogenes cells (bacteriostatic); while reduced pathogen growth refers to a decrease in the number of inoculated L. monocytogenes cells (bactericidal) in the product. In this study, tables showed the reduction varied with storage days, but was up to 1.0 log on some days. Antimicrobials were found to have no effect on pH except for sodium diacetate at 0.5 % which reduced the initial pH. Using the formulations and conditions in the study, establishments can add 3 % sodium lactate in the frankfurter formulation and obtain no growth of L. monocytogenes up to 70 days at refrigerated storage of 4\u00b0 C. If the lethality treatment is adequate to eliminate L. monocytogenes, then the only probable source of L. monocytogenes would be from exposure of the product during peeling and repackaging. However, the establishment\u2019s sanitation program may keep the numbers to a very low level, and 3 % sodium lactate included in the formulation would inhibit the growth of L. monocytogenes during the product\u2019s refrigerated shelf life. Levels of sodium lactate at 6.0 % and sodium diacetate at 0.5 % showed a reduction of the pathogens, however these levels are above the permitted levels. This study by Samelis et al., (2002) used similar treatments, processing and inoculation procedures and frankfurter formulations as the previous study described above. However, in this study combinations of antimicrobials were used, and in combination with hotwater treatment. Hot water treatment involved immersion of frankfurters, with two product links in a package to 75 or 80\u00b0 C for 60 s. Storage at 4\u00b0 C shows: 62", "Updated Compliance Guidelines May 2006 TREATMENT LEVELS (%) L. MONOCYTOGENES GROWTH INHIBITION Sodium lactate 1.8 35-50 days no growth Sodium lactate + 1.8 120 days no growth; 35-50 days growth sodium acetate 0.25 reduction Sodium lactate + 1.8 120 days no growth; 35-50 days growth Sodium diacetate 0.25 reduction Sodium lactate + 1.8 120 days no growth, 35-50 days growth Glucuno-delta0.25 reduction lactone Hot water treatment (80\u00b0 C, 60 s) + Inoc. population reduced by 0.4-0.9 log CFU/cm<sup>2</sup>, and Sodium lactate 1.8 50-70 days growth reduction by 1.1-1.4 CFU/cm<sup>2</sup> Hot water treatment Increase in growth to about 6-8 logs in 50 days (80\u00b0 C, 60 s) Inoculated Control, Increase in growth to about 6 logs in 20 days no treatment and 8 logs thereafter up to 120 days Note: Sodium lactate was used as a 3 % of a 60 % (wt/wt) commercial solution. Glucunodelta lactone is approved as an acidifier, and a curing accelerator, but not as antimicrobial. Sodium acetate is approved as a flavor enhancer, not as an antimicrobial agent. Glass et al., (2002) evaluated sodium lactate and sodium diacetate on wieners and cooked bratwurst containing both beef and pork supplied by a commercial manufacturer. Antimicrobial solutions used were sodium

lactate and sodium diacetate singly or in combination at varying concentration. Wieners were repackaged in gas-impermeable pouches, then surface-inoculated with *L. monocytogenes* mixture on multiple areas of the surface of each link. Packages were vacuum-sealed and stored at 4.5°C for up to 60 days. Two types of cooked bratwurst from a commercial manufacturer were evaluated: bratwurst that was cured and naturally smoked and bratwurst that was uncured and unsmoked. Bratwurst was stored at 3 or 7°C for up to 84 days. The surface treatment consisting of dipping wieners into solutions containing up to 6 % lactate and up to 3 % diacetate for 5 s did not delay pathogen growth, indicating that dipping wieners in the lactate/diacetate solutions is not an efficient way to apply the antimicrobials. However, the inclusion of lactates and diacetates in the formulation was found effective in inhibiting growth of *L. monocytogenes*. Results are as follows: PRODUCT Sodium Lactate (%) Sodium diacetate (%) *L. monocytogenes* levels (CFU/pkg) Bratwurst 3.4 0.1 Growth delayed for 4-12 weeks at 7 and uncured, unsmoked 3°C storage, respectively. 2.0 0.0 Growth delayed for 1-2 weeks at 7 and 3°C 63", "Updated Compliance Guidelines May 2006 Bratwurst 3.4 0.1 Growth inhibited for 12 weeks at 7 and cured, 3°C smoked 0.0 0.0 Growth up to 1 log after 4 weeks at 7 and 3°C Wieners 3.0 1.0 0.0 0.1 Growth inhibited for 60 days at 4.5°C Growth inhibited for 60 days at 4.5°C Study by (Porto et al., 2002) used freshly processed peeled frankfurters in vacuum sealed packages obtained from a commercial manufacturer. Two formulations of links were used in the study: one with added 2 or 3 % potassium lactate and the other without added potassium lactate. Frankfurters were aseptically removed from their original package, repackaged, and inoculated with a mixture of *L. monocytogenes*. The packages were vacuum-sealed to 95 kPa and incubated at 4 and 10°C. Results show that addition of 2 % or 3 % potassium lactate in frankfurters can appreciably enhance safety by inhibiting or delaying the growth of *L. monocytogenes* during storage at refrigeration or abused temperatures. The viability of the pathogen was influenced by pH, and the levels of lactate added, but not by the presence of indigenous lactic acid bacteria. Potassium lactate (%) Inoculum CFU/pkg Storage temp °C Days Storage *L. monocytogenes* levels (CFU/package) 2.0 20 4 90 Remained at about 1.6 log 3.0 20 4 90 Remained at about 1.4 log 3.0 500 4 90 Remained at about 2.4 log 0.0 20 4 90 Increased to about 4.6 log 0.0 500 4 90 Increased to about 5.0 log 2.0 20 10 60 Remained at about 1.4 log 3.0 20 10 60 Remained at about 1.1 log 0.0 20 10 60 Increased to about 6.5 after 28 days, declined to about 5.0 after 60 days 3.0 500 10 60 Remained at about 2.4 0.0 500 20 60 Increased to about 6.6 log after 40 days and declined to about 5.5 log after 60 days II. Growth Inhibitor Packaging Growth inhibitor packaging is an intervention, which delivers an active antibacterial agent to the surface of an encased sausage product. By incorporating this special coating onto the internal surface of cellulose casings, the antilisterial treatment is transferred to the surface of the processed meat/sausage during thermal processing. Upon removal of the casing, the treatment remains active on the meat surface, providing effective protection against inadvertent *Listeria* contamination during subsequent peeling and packaging processes. Growth inhibitor packaging used in conjunction with functional 64", "Updated Compliance Guidelines May 2006 HACCP and Good Manufacturing Practices provides the industry with one more tool in their intervention strategy to control the risk of pathogen contamination in ready-to-eat meat and poultry products. Studies on meat formulations for hotdogs using NOJAX® AL® showed that use of the casings provide a lethality hurdle to the growth of *Listeria monocytogenes*, not just

an inhibitory effect. The lethality impact is delivered within the first hours\days of the sausage\hotdog package life. This impact is dependent on many variables but is generally in the range of 1 \u2013 2 log kill of *L. monocytogenes* at high levels of inoculation. This performance has been observed in challenge studies conducted on hotdogs drawn from commercial full-scale trials at a number of commercial processing plants. In high inoculation trials, NOJAX AL has been combined with conventional growth inhibiting additives, and as expected, the lethality impact is obtained and then maintained throughout the product life cycle. In these same trials, without growth inhibiting additives, this casing produces lethality but in several weeks the remaining *L. monocytogenes* begin to grow. NOJAX AL is available in the U.S. having approval by both FDA and USDA for its key component, nisin. This GRAS component must be included in the ingredient statement via a label change request to the FSIS Labeling and Consumer Protection Staff. Because this is a naturally derived polypeptide, there are storage and use-by criteria that will have to be adhered to by the user for maximum benefit. Casing shelf-life is about 60-90days with a not to exceed 85\u00ba F. This technology can be applied to most hotdogs and sausages that are encased in cellulose casing. This casing intervention can be used in any instance where casing is used as a mold for processed meat and poultry during thermal processing. This would include cellulose, plastic, and possibly natural casing. As part of a manufacturer\u2019s decision to use this technology, benefits are: 1) no capital costs or new equipment; 2) no change in processing steps, plant reconfigurations or introduction of process bottlenecks\u2014essentially processor transparent in all aspects of use except casing storage requirements; 3) no impact on flavor, texture, or package appearance, and 4) minor labeling change to ingredient statement Since this is a surface treatment, cost will be proportional to the surface to volume ratio of the product: the larger the sausage diameter, the lower the cost per pound. In general, economic analyses put the cost of this lethality intervention at about 2-3 cents per pound of finished product, with a mid-range target price of 2.5 cents per pound for a traditional 10-to-the-pound retail pack of hotdogs.

Janes et al., (2002) investigated the effect of nisin added to zein film coatings (Z) coated onto cooked ready-to-eat chicken against *L. monocytogenes*. Cooked chicken samples inoculated with *L. monocytogenes* were dipped into Z dissolved in propylene glycol or ethanol, with or without added nisin (1,000 IU/g) and/or 1 % calcium propionate and stored at 4 C or 8 C for 24 days. After 16 d at 4 C, *L. monocytogenes* was suppressed by 4.5 to 5 log CFU/g with zein film coatings with nisin. The most effective treatment in the 65", "Updated Compliance Guidelines May 2006 study for controlling *L. monocytogenes* on the surface of ready-to-eat chicken was using edible zein film coatings containing nisin at a storage temperature of 4\u00b0C. The use of film coatings in a processing plant would be to fully process the meat products then coat them with the films. Coating can be done by spraying or dipping the processed meat products and then allowing them to dry. Zein coatings on the meat products can be dried by circulating air around the meat product using a fan. Finally, the dried coated meat products can be packaged with the usual plastic film material and refrigerated. This study has not been tested in commercial poultry processing conditions. Some general observations from the published studies on antimicrobials: \u2022 Lactates, acetates and diacetates were found more effective in inhibiting growth of *L. monocytogenes* when used in combination than when used singly. \u2022 These antimicrobials were found more effective when used to the maximum allowable concentration. However, higher concentrations of antimicrobials used in

the formulation may affect the sensory qualities of the product, such as flavor and texture, which would necessitate sensory evaluation of treated products. When used in combination, the amount needed to inhibit growth may be reduced. These antimicrobials were found to have listerostatic activity more than listericidal activity, i.e. they prevent growth of the pathogen more than reduce the number of cells of the pathogen, and therefore may not be effective against gross contamination of a product. The establishment's sanitation program should control gross contamination of the processing environment and equipment. Addition of antimicrobials would be effective only as part of the overall HACCP strategy. Including these antimicrobials in the formulation was found to be more effective in inhibiting listerial growth than dipping products in solutions of antimicrobials. The antimicrobial activity of lactates and diacetates when used singly or in combination is affected by the level of contamination of the meat product surface, and processing factors such as pH, moisture, water activity, fat, nitrite, salt content, time and temperature of storage, and packaging atmosphere. Application of the treatments used in these studies is limited to the formulations, products and treatments used in the studies. Applying these studies to other products and formulations may result in different rates of growth inhibition. Therefore the effectiveness of the antimicrobials used in these studies must be verified by the establishment for other processed meat products and other storage temperatures. Antimicrobials used in the formulation must have an effective antilisterial activity throughout the commercial shelf life of the product. Currently the targeted commercial shelf life of refrigerated cooked meat products in the U.S.A. is 75 to 90 days.

Using post-packaging thermal treatments in addition to antimicrobials was found to increase the total antilisterial effects of the antimicrobials. These antimicrobials were found to be more effective in smoked products formulated with sodium nitrite, or in products stored at strict refrigeration temperatures. 66", "Updated Compliance Guidelines May 2006

Use of these antimicrobials may be a cost effective antilisterial method that very small establishments can use. References are found on pp. 48-49. 67", "Updated Compliance Guidelines May 2006 ATTACHMENT 5 Hold-and-Test Sampling for the FSIS LM Rule Background On June 6, 2003, FSIS published an interim final rule on the control of Listeria monocytogenes in ready-to-eat (RTE) meat and poultry products. Most processors of RTE products will have to conduct microbiological testing of product contact surfaces. The rule states that establishments using antimicrobial agents or processes under Alternative 2 and establishments producing non-hotdog or non-deli products under Alternative 3 must identify the conditions under which they will implement hold-and-test procedures. The rule describes the hold-and-test procedures to be followed by establishments producing hotdog and deli products under Alternative 3. Under alternative 3, an establishment producing a hotdog or deli product that obtains a positive for Listeria monocytogenes or an indicator organism such as Listeria spp. in follow up testing on food contact surfaces must hold lots of product that may have become contaminated by the food contact surface and must sample and test these lots before release into commerce. In addition, establishments producing RTE products must identify conditions under which the establishment will implement hold-and-test procedures following a positive test for Listeria spp. or L. monocytogenes on a food contact surface. In response to NFPA questions, FSIS officials have indicated that the intent is not to set a minimum level of sampling, but rather to rely on the industry to identify what they individually or as a group consider to be reasonable and

scientifically supportable. The Agency encouraged the industry to consider the ICMSF tables (International Commission on Microbiological Specifications for Foods. Microorganisms in Foods 7: Microbiological Testing in Food Safety Management. Kluwer Academic\Plenum Publishers, NY. 2002). ICMSF Sampling Plans for Listeria monocytogenes ICMSF categorizes microbial hazards according to risk \u2013 moderate, serious and severe. ICMSF ranks L. monocytogenes as either a serious hazard in foods for the general population or a severe hazard in foods for restricted populations (high risk groups). ICMSF describes 15 different cases of sampling plans, with sampling plan stringency based on degree of risk and the effect on risk of the conditions of use. Cases 10, 11 and 12 would apply to the serious category, and cases 13, 14, or 15 would apply to the severe category of microbial hazards. ICMSF considers cases 13, 14, and 15 to apply to foods intended specifically for highly susceptible individuals (e.g., hospitals and nursing homes) because a large proportion of the individuals would be potentially susceptible; thus, increasing the stringency of the sampling plans is appropriate. Cases 10, 11 and 12 68", "Updated Compliance Guidelines May 2006 apply to foods for the general population, where the proportion of susceptible individuals is much lower; thus, the overall risk of illness is reduced. Recent risk assessments have demonstrated that low levels of L. monocytogenes in food pose little risk, even for the highly susceptible population. For cases 10 or 13, conditions of use reduce risk (e.g., the numbers of L. monocytogenes will decrease). For cases 11 and 14, conditions cause no change in the hazard (e.g., the organism cannot grow), and for cases 12 and 15, conditions may increase the risk (e.g., foods in which L. monocytogenes can grow are subjected to conditions that allow growth). Sampling plans for the cases are given in the table below, where n is the number of samples and c=0 means that none of the \u201cn\u201d 25-g samples can be positive for L. monocytogenes. The table also provides the sampling plan performance, assuming a log-normal distribution with a standard deviation of 0.8; lots having the calculated mean concentrations or greater will be rejected with at least 95% confidence. Each of these plans achieves assurance that L. monocytogenes is present at <1 in 25 g. It is recommended that the 25 g. sample be analyzed separately and not composited. However, if compositing is to be done, composites of 25-g portions should not exceed a total of 125 g. in order to maintain the sensitivity of the method of analysis.

The number of samples recommended will be collected in 1 day and all affected products will be held during the testing period. Testing can be for Listeria spp. or L. monocytogenes. Any positive results from this follow-up testing (using the ICMSF approach) should lead to more significant investigations of the cause and of prevention before intensified follow-up testing. If samples tested positive for Listeria spp., the establishment should confirm for L. monocytogenes and if positive for L. monocytogenes, the product is considered adulterated. The establishment must conduct rigorous corrective actions, and other sanitation and HACCP type activities. Establishments may send a letter or certification when they ship tested products to nursing homes, hospitals and other institutions with susceptible populations. Such a letter would indicate that product has been sampled and tested according to ICMSF recommendations. Establishments supplying nursing homes, hospitals and other institutions with the susceptible populations are expected to implement whatever additional controls and verification procedures are necessary to ensure that product is not adulterated.

70", "Updated Compliance Guidelines May 2006 ATTACHMENT 6 HOLD-AND-TEST SCENARIO FLOWCHART

The following flow chart is a most likely scenario for a hold and test situation. The flowchart illustrates what an establishment could do in case of a food contact surface (FCS) testing positive for Listeria spp. or Listeria-like organisms, and when a follow-up FCS test is positive. Establishments can design their own procedures or flowchart for their hold and test program. Repeated positive FCS test would imply an inadequate sanitation system or harborage of the pathogen and establishments should investigate and reassess their sanitation program, their equipment layout and design product flow to determine the cause of the contamination. For repeated food contact surface positives for Listeria spp. or Listeria-like organisms during the hold and test period, establishments can test associated product for L. monocytogenes based on a sampling plan. This chart only addresses FCS testing with Listeria spp or Listeria-like organisms. If the establishment tests FCS for L. monocytogenes and the result is positive, product in the sampled lot is considered adulterated. The establishment can destroy the product or reprocess the product with a process that is destructive of L. monocytogenes.

71", "Updated Compliance Guidelines May 2006 ATTACHMENT 6 HOLD-AND-TEST SCENARIO FLOWCHART

If the FCS tests positive for L. monocytogenes or Listeria Spp. or Listeria-like organisms, the establishment must conduct follow-up testing to verify its corrective actions. If during the follow-up testing another positive FCS occurs, the establishment must hold the applicable product lot if positive for L. spp. or L.-like, or destroy or rework with a process destructive of L. monocytogenes if positive for L. monocytogenes, and test the FCS until the establishment corrects the problem as indicated by the test result. In addition, the establishment must test held product lots for Listeria monocytogenes using a sampling plan that will provide a statistical level of confidence. The flowchart above shows a test and hold scenario which an establishment in this type of situation can use. The following section describes the likely action and reaction of inspection personnel during a hold and test situation. Day 1, 4 The testing program and the test results for food contact and non-food contact surfaces should be available to inspection program personnel. In case of a FCS testing positive for L spp. or Listeria-like organism, inspection program personnel will verify that the establishment is performing the corrective actions as specified in the HACCP plan, Sanitation SOP or prerequisite programs, including any intensified cleaning and sanitizing. For deli and hotdog products in Alternative 3, inspection personnel will verify that the establishment is conducting follow-up testing for FCS to determine the effectiveness of the corrective actions, targeting most likely source of contamination and additional tests in surrounding FCS area, and recording all these. Day 7 Results of the follow-up FCS tests are available on this day. If the FCS tests are negative, then the establishment continues with its normal production and sanitation program procedures. If the follow-up FCS tests are positive for L. monocytogenes, Listeria spp. or Listeria-like organisms, inspection program personnel will verify that the establishment is following its corrective action for a second FCS positive, including intensified cleaning and sanitizing. For deli and hotdog products in Alternative 3, inspection personnel will verify whether the establishment is holding the product produced that day and testing the product lot for L. spp or L. monocytogenes, and whether the establishment is conducting follow-up testing of FCS during each production, and holding all products until a negative follow-up FCS test is obtained. Products produced on days 8, 9 and 10 are held until the follow-up FCS test available after about 3 days is found negative. The interim rule states that products must be held until the problem is corrected as indicated by testing. For establishments in Alternative 3 producing deli and hotdog products, inspection personnel can cite the establishment if these procedures are not followed. Days 8, 9, and 10 73", "Updated Compliance Guidelines May 2006 The presence of Listeria spp. or Listeria-like organisms on a food contact surface or on ready-to-eat (RTE) product is associated with the potential for an insanitary condition to exist. FSIS expects an establishment to develop a compelling justification for concluding that product produced on days in which insanitary conditions may have existed is not adulterated. Thus, FSIS would further expect that the establishment, on days 8-10 would conduct verification testing on the food contact surfaces to demonstrate that the potential insanitary condition was adequately

redressed via the corrective and preventative actions. In addition, to further develop a compelling justification to support the establishment's decision, FSIS would expect a prudent establishment to also compile data on product testing to confirm and verify that the corrective and preventative actions were effective in preventing product from becoming adulterated.

Day 10 If Day 7 FCS Test is Positive Inspection program personnel will verify that if the follow-up FCS test taken on Day 7 is positive, then the day's production lots of deli and hotdog products in Alternative 3 are held and tested for Listeria spp. /Listeria-like or L. monocytogenes and the same procedures are followed as in the second FCS (+) test as in Day 7. If FCS samples taken on day 7 are found positive for L. spp. /L.-like on day 10, the establishment should hold and test product produced on days 8, 9 and 10 unless the establishment has supporting documentation to justify that product produced on days 8, 9 and 10 would not be contaminated with L. monocytogenes. The sampling plan must provide a level of confidence that each product is not contaminated with L. monocytogenes. Because of 3 consecutive positive FCS, the establishment should conduct intensive cleaning and sanitizing and reevaluate its sanitation program. If FCS is positive for L. monocytogenes, affected product lots are considered adulterated. The establishment should also hold and test products produced on days 8, 9 and 10 because a FCS positive for L. monocytogenes shows that the corrective action may not have been effective in removing the contamination and products produced on succeeding days may also be contaminated. If Day 7 FCS Test is Negative If FCS samples taken on day 7 are found negative for Listeria spp. /Listeria-like on day 10, the establishment should wait for the results of the FCS tests conducted on days 8, 9, and 10 as detailed above, and results of the Day 7 product test before releasing these products. Products produced on days 8 and 9 may be released without waiting for product testing results if the establishment has a compelling justification for concluding that products produced on those days are not adulterated.

Day 14 If day 7 product was found positive for L. monocytogenes on day 14, affected product lots produced on day 7 are considered adulterated. The establishment must destroy the product lots or rework them with a process destructive of L. monocytogenes. The establishment should continue holding product lots produced on days 8, 9, and 10 until results of products tests are available, unless the establishment has supporting "Updated Compliance Guidelines May 2006" documentation for why product produced on days 8, 9 and 10 would not be contaminated with L. monocytogenes. Establishment should also test and hold product produced before day 7 and recall them if already in commerce or provide compelling evidence that product produced before day 7 was not adulterated. For a product sample that tests positive for L. monocytogenes, inspection personnel will verify that the product lots affected are disposed properly, i.e., destroyed, or reworked with a process destructive to L. monocytogenes. Establishments should have supporting documentation that products lots produced before Day 7 are not contaminated with L. monocytogenes, so that these will not be included as adulterated. A product that is positive for Listeria. spp. or Listeria-like is not summarily determined to be adulterated, although it can lead to a determination that an insanitary condition exists and without compelling documentation, the establishment may not be able to conclude that the product is not adulterated. This also indicates that corrective and preventative actions taken may not have been effective, or that the sanitation program is inadequate and ineffective and therefore, the establishment needs to take actions to prove otherwise. The establishment needs to have compelling documentation that the product is not

adulterated and needs to determine that its sampling plan provides a level of confidence that each product is not contaminated with *L. monocytogenes*. If the establishment is using a post-lethality treatment or antimicrobial agent and the product tests positive for *Listeria* spp., *Listeria*-like organisms, or *L. monocytogenes*, according to 417.6(e), the HACCP plan may be found inadequate. In determining whether the HACCP plan is inadequate, the Agency will take into account all available information and consider the entire situation. The cause and significance of a positive result varies from case to case depending on the circumstances of processing involved, and the pathogen found. FSIS will consider whether some or all products produced under the same or a substantially similar HACCP plan are affected, whether there have been other incidents of product contamination with the pathogen, and whether incidents of product contamination have been persistent or recurring. Establishments are required to take corrective and preventive actions in accordance with 9 CFR 417.3. The Agency will expect the same rigor for testing and sanitation at the point that product testing is reached for products in Alternative 3 and in Alternative 2, using an antimicrobial agent or process. For products in Alternative 1, and in Alternative 2 using post-lethality treatment, if FCS is positive for *Listeria* spp. or *Listeria*-like organisms, product holding and testing may not be necessary as long as the post-lethality treatment is validated to reduce *L. monocytogenes* by at least 1 log, and the establishment verifies the effectiveness of the post-lethality treatment.

"Updated Compliance Guidelines May 2006" 76 ATTACHMENT 7 PROCEDURES FOR THE EVALUATION OF ESTABLISHMENT CONTROL PROGRAMS FOR LISTERIA MONOCYTOGENES

FSIS is conducting an evaluation of the effectiveness of the post-lethality treatment, antimicrobial agent or process and the sanitation program used by establishments to control *Listeria monocytogenes* (LM) in their post-lethality exposed ready-to-eat (RTE) meat and poultry products. Results of this evaluation will be used to determine the risk of LM contamination and the frequency of risk-based verification sampling for LM. This document includes procedures and questionnaires for evaluating an establishment's control measures for LM. The document also contains an Appendix that includes definitions, explanation of terms, and examples of validation studies with highlighted information that are important for control.

Background: *L. monocytogenes* is a hazard that an establishment producing post-lethality exposed RTE products must control through its HACCP plan or prevent in the processing environment through a Sanitation Standard Operating Procedures (SOP) or other prerequisite program.

9 CFR Part 430 \u201cControl of *Listeria monocytogenes* in Ready-to-Eat Meat and Poultry Products: Final Rule, June 6, 2003\u201d with implementation starting on October 6, 2003, mandates establishment compliance with one of three postlethality alternatives. For establishments that produce RTE products that are post-lethality exposed, FSIS needs your assistance in providing information that will answer the following questions.

1. Has the establishment selected one of the three alternatives per 430.4(b) of the regulations?
2. For establishments electing to use Alternative 1, the following questions apply: (a) Does the establishment use a post-lethality treatment for product AND an antimicrobial agent or process that suppresses or limits the growth of LM? (b) How effective is that process?
3. For establishments electing to use Alternative 2, the following questions apply: (a) Does the establishment use a post-lethality treatment for product OR an antimicrobial agent or process that suppresses or limits the growth of LM? (b) How effective is that process?
4. For establishments electing to use Alternative 3, the following questions apply: (a) Does the establishment have a sanitation program that addresses testing of food contact

surfaces: How effective is that program? You will evaluate the establishment's level of effectiveness in implementing Alternatives 1, 2 and 3 through a set of questions for each Alternative. The set of questions for each Alternative are provided in separate Evaluation Sections in the Procedures. The Evaluation Sections are numbered I, II, III and IV. Step 4 in the Instructions matches each Alternative with the appropriate Evaluation Sections. INSTRUCTIONS (If you have any questions regarding this survey, please contact Amelia K. Sharar (202-205-0009, Amelia.Sharar@FSIS.USDA.gov ) or Paul Uhler (202-205-0438, Paul.Uhler@FSIS.USDA.gov ) Step 1: Have the following documents ready and available for review: the establishment's HACCP plan, Sanitation SOP, and prerequisite programs addressing post-lethality exposed RTE product associated with 9 CFR 430. Use the establishment's completed FSIS Form 10, 240-1 as reference ONLY. Do not simply restate what is on the form." "Updated Compliance Guidelines May 2006 77 For determination of risk-based verification testing, FSIS needs to have this evaluation completed without participation of establishment personnel. All information needed should be readily available for review, in accordance with HACCP requirements. FSIS will follow-up in circumstances in which there are significant discrepancies between these procedures and the information provided by the establishment on FSIS Form 10,240-1. NOTE: FSIS is not asking the establishment personnel to participate by responding to the checklist questions because FSIS has not sought approval from OMB to conduct such information gathering from industry. However, FSIS does have authority to assess and document the information relative to the checklist that is available as part of the establishment's food safety system FSIS can share with the establishment the checklist and the FSIS assessment that was completed as part of the checklist. Step 2: Answer preliminary questions in Guide to Selecting Evaluation Sections. Step 3: Read through the evaluation sections and accompanying tables prior to completing the preliminary question related to the control programs for each applicable product(s): Section I: Post-lethality Treatment (PLT) Section II: Antimicrobial Agent or Process (AMAP) Section III: Sanitation Program Section IV: On-going Verification Step 4: For each Alternative, use the following sections to rate the evaluation of that control program: Alternative 1, use Section I, II, III and IV Alternative 2 (PLT), use Section I, III and IV Alternative 2 (AMAP), use Section II, III and IV Alternative 3, Section III and IV Step 5: Follow the instructions provided on how to score the establishment's validation and on-going verification documentation in your assessment for each product.

**GUIDE TO SELECTING EVALUATION SECTION PRELIMINARY QUESTIONS**

Establishment Number: \_\_\_\_\_ 1. Does the establishment produce post-lethality exposed ready-to-eat product covered by 9 CFR 430? YES NO (STOP, product is not covered by 9 CFR 430) 2. Did the establishment develop control measures that meet one of the three Alternatives for the product, as required in 9 CFR 430.4? YES NO (STOP and consult with front-line supervisor) 3. In the chart below, list the products covered by 9 CFR 430 and the Alternative chosen by the establishment. NOTE: There can be only one Alternative chosen for each product group. If needed, please refer to the establishment's FSIS Form 10,240-1 to answer these questions and use your best judgment based on how the process is being controlled in accordance with 9 CFR 430. Group the products that are controlled by the same Alternative and treatment. Use separate evaluation forms for products or product groups with unique situations, such as having the same", "Updated Compliance Guidelines May 2006 78 alternative and treatment but with different methods\sources of validation or with different

log reduction or suppression. For example, for the same product in Alternative 2 using AMAP and the same antimicrobial agent used, such as hotdog treated with sodium lactate validated by a challenge study, and hotdog treated with sodium lactate validated using a modeling program, separate evaluation forms should be used. Conduct one evaluation for each product group, using the questions in the appropriate Evaluation Sections for that group\ufe0f Alternative (See Step 4 Instructions). Include the name of each product within the group in the entry for product name in the Preliminary Questions section. Complete as many Evaluation Sections to cover all products produced by the establishment that are associated with 9 CFR 430. PRODUCT(GROUP) NAME ALTERNATIVE 4. Complete the sections that correspond to the chosen alternative. Alternative 1 (PLT and AMAP) Sections I, II, III and IV Alternative 2 (PLT only) Sections I, III and IV Alternative 2 (AMAP only) Sections II, III, and IV Alternative 3 (Sanitation) Sections III and IV", "Updated Compliance Guidelines May 2006 79 SECTION I \ufe0f Post-Lethality Treatment (PLT) Product (Group) Name:

Post-lethality Treatment used:

For the following questions, please place an X in the appropriate response column. (NOTE: If needed, please refer to the establishment\ufe0f FSIS Form 10,240-1 to answer these questions and use your best judgment based on how the process is being controlled in accordance with 9 CFR 430. Rate and score responses using the scoring instructions at the end of these questions.) Questions Yes No Not Sure N/A 1. Is the post-lethality treatment validated and documented? (Note: See APPENDIX for examples of validation.) 2. Has the establishment identified the critical variables (e.g., time, temperature, pressure, concentration, pH, etc.) used in the validation? (Note: Examples of validation methods that can be used are challenge study for the product, published study, modeling program.) 3. If the critical variables have been identified for PLT, are they being applied in the HACCP plan in a similar manner? 4. Is the product or product formulation used in the validation the same as or similar to the product or product formulation for which the establishment is using the PLT? 5. Is the establishment using the PLT as described in the validation with regards to equipment and procedures? 6. If the critical variables, product formulation, procedure or equipment used by the establishment are not the same as or similar to those used in the validation, did the establishment conduct additional validation that demonstrated the changes are effective? (Note: Place an X on N/A if you answered \ufe0fYES\ufe0d to questions 2-5) 7. If the establishment did not conduct additional validation, did it provide any rationale to explain why the PLT is effective and has the same impact even though the critical variables, product formulation, procedure or equipment are different? (Note: Place an X on N/A if you answered \ufe0fYES\ufe0d to questions 2-5) 8. Did the establishment conduct an initial validation to test the adequacy of the CCP, critical limits, monitoring and recordkeeping procedures, and corrective actions as stated in the HACCP plan? (This would be evident by data to demonstrate that the CCP was applied and the process was tested, e.g., product was tested prior to the treatment for presence\absence, and\or level of LM, and tested after the treatment for the same attributes in order to find low level of LM contamination using appropriate number of tests from randomly selected samples. Reliance only on tests with negative results after treatment is not considered product validation and should be marked as \ufe0fNo\ufe09- not validated.) 9. Does the establishment have a rational basis or data to show that the reduction of LM by the PLT as described is sufficient to

control the level of contamination of LM that may occur in the product? (Example: evidence of actual reduction of LM contamination on product by PLT vs. level of contamination on food contact surface) 10. Do the information in the HACCP plan, Sanitation SOP and Prerequisite programs (e.g., Alternative, PLT, AMAP, log reduction, log suppression, FCS testing frequency, etc.) corroborate the information on the survey form (FSIS Form 10,240-1) that the establishment submitted? (Note: If No, consult with the front-line supervisor and, if appropriate, inform the establishment and request it complete and submit a new Form 10,240-1 with revised information.) 11. Is the PLT treatment a pre-packaging treatment, i.e., the PLT is applied after", "Updated Compliance Guidelines May 2006 80 Questions Yes No Not Sure N\A environmental exposure but before re-packaging (e.g., infra-red treatment)? (Note: If No, stop and rate this section) 12. If the PLT is a pre-packaging PLT, does the establishment have validated control measures in place to prevent recontamination after treatment and before re-packaging? (Examples of control measures are: 1) aseptic packaging procedures; 2) packaging equipment located right after the PLT equipment; 3) use of antimicrobials; 4) positive air flow; 5) other environmental control program.) You have completed this section. Please rate this section. Rating: Conclusive: Answered \u2018yes\u2019 for #1-5, 8-10, and 12 if \u2018yes\u2019 to 11 Substantiated: Answered \u2018yes\u2019 to #1-3 and [6 or 7], [8 or 9], and 12 if \u2018yes\u2019 to 11 Inconclusive: Answered \u2018no\u2019 or \u2018not sure\u2019 to any of the following #1- 3, [6 or 7], [8 or 9] and 12 if \u2018yes\u2019 to 11, Use the conclusions obtained from the questions above (conclusive, substantiated, or inconclusive) to applicable establishment PLT in Table 1.", "Updated Compliance Guidelines May 2006 81 Table 1: Features of a Validated Post-lethality Treatment Table 1 gives numerical scores based on the method of validation and the log reduction achieved by the PLT. The more rigorous the validation method and the log reduction achieved by the PLT, the lower the risk, and the higher the scores. The risk of LM contamination goes down as the score goes from inconclusive to conclusive. Using the result from Section I, circle the score provided (in parenthesis) for the appropriate feature and criteria. For example, if the establishment\u2019s PLT as documented in its HACCP plan was derived from a manufacturer challenge study and achieves 2 log reduction of LM, and the result from SECTION I is Conclusive, circle the score provided on the appropriate row (manufacturer challenge study and equal to or greater than 2 log reduction), which in this case is 10. Control measure Feature Criteria1 Inconclusive Substantiated Conclusive Post-lethality treatment Challenge study for the product conducted by establishment or manufacturer Less than 1 log reduction (0) (0) Equal to or greater than 1 log, but less than 2 log reduction (0) (3) (5) Equal to or greater than 2 log reduction (0) (5) (10) Published challenge study Less than 1 log reduction (0) (0) (0) Equal to or greater than 1 log, but less than 2 log reduction (0) (2) (4) Equal to or greater than 2 log reduction (0) (4) (8) Modeling Program Less than 1 log reduction (0) (0) (0) Equal to or greater than 1 log, but less than 2 log reduction (0) (1) (3) Equal to or greater than 2 log reduction (0) (3) (7) 1 Criteria: Log reduction of Listeria monocytogenes (Lm)", "Updated Compliance Guidelines May 2006 82 SECTION II-Antimicrobial Agent or Process (AMAP) Product (Group) Name:

Antimicrobial Agent or Process Used:

For the following questions, please place an X in the appropriate response column. (NOTE: For products using extrinsic or intrinsic characteristics (freezing below -0.4\u00ba C (31.3\u00ba F), pH below 4.39, or water activity

below 0.92), skip questions 4-11. Also, if needed, please refer to the establishment\u2019s FSIS Form 10,240-1 to answer these questions and use your best judgment based on how the process is being controlled in accordance with 9 CFR 430. Rate and score your responses using the scoring instructions at the end of these questions.) Questions Yes No Not Sure N\A 1. Is the AMAP validated or tested, with documentation on file? (Examples: challenge study, published study, modeling program. See Appendix) (Note: Select \u201cYES\u201d if extrinsic or intrinsic characteristics such as freezing below -0.4\u00ba C (31.3\u00ba F), pH below 4.39, or water activity below 0.92r are used.) 2. Has the establishment identified the critical variables (e.g., time, temperature, pressure, concentration, moisture, pH, water activity, etc.) used in the validation? (Note: Examples of validation sources or documentation that can be used are challenge study for the product, published study, modeling program, extrinsic or intrinsic characteristics.) 3. If the critical variables have been identified, are they being applied in the application of the AMAP in the product? 4. Is the establishment using the AMAP as described in the validation with regards to equipment and procedures? 5. Is the product formulation used by the establishment the same or similar to the product or product formulation used in the validation study using the AMAP? (Examples of product formulation factors: amount of antimicrobial agent used; species [ e.g., beef, pork, chicken, turkey, etc.]; whether cured or uncured; amount of salt and moisture in finished product ) 6. If the critical variables, product formulation, procedures or equipment used by the establishment are not exactly the same as those used in the validation, did the establishment conduct additional validation that demonstrated that the changes are effective? (Note: Place an X on N\A if you answered \u201cYES\u201d to questions 2-5.) 7. If the establishment did not conduct additional validation, did it provide any rationale to explain why the treatment is effective and have the same impact even though the critical variables, product formulation, procedure or equipment are different? (Note: Place an X on N\A if you answered \u201cYES\u201d to questions 2-5.) 8. Did the validation study or validation of the model include a shelf life study, i.e., determining the growth of LM during storage? 9. Is the refrigerated shelf life (use by date on the label) shorter or the same as the recommended shelf life in the validation? Note: Place an X on N\A if no shelf life on label. 10. Did the establishment initially test for the adequacy of the AMAP in inhibiting LM growth? (Example: product was tested prior to the treatment for level of LM, and tested after the treatment and during the shelf life for the same attributes in order to find the presence of low level growth during shelf life using appropriate number of tests from randomly selected samples.)", "Updated Compliance Guidelines May 2006 83 Questions Yes No Not Sure N\A 11. Does the establishment have a rational basis or data to show that the level of growth allowed by the AMAP is sufficient to control LM growth in the product? (Example: evidence of actual inhibition of LM growth on product by AMAP vs. level of contamination on food contact surface) 12. Do the information in the HACCP plan, Sanitation SOP and Prerequisite programs (e.g., Alternative, PLT, AMAP, log reduction, log suppression, FCS testing frequency, etc.) corroborate the information on the survey form (FSIS Form 10,240-1) that the establishment submitted? Substantiated: Answered \u2018yes\u2019 to #1 and [5 or 6], and 8. For products using extrinsic or intrinsic characteristics, \u2018yes\u2019 answers to #1- 3. Inconclusive: Answers with \u2018no\u2019 or \u2018not sure\u2019 to any of the following: #1, [6 or 7], and 8. For products using extrinsic or intrinsic characteristics, \u2018no\u2019 or \u2018not sure\u2019 answers to #1- 3. Use the conclusions obtained from the questions above (conclusive, substantiated, or inconclusive) to applicable establishment AMAP in Table 2.","Updated Compliance Guidelines May 2006 84 Table 2. Features of an Effective Antimicrobial Agent\Process This table gives numerical scores based on the method of validation and the log growth allowed by the AMAP. The more rigorous the validation method or the effectiveness and the lower the log growth allowed by the AMAP, the lower the risk, and the higher the scores. Using the result from Section II, circle the score provided (in parenthesis) for the appropriate feature and criteria. For example, if the establishment\u2019s AMAP as documented in its control program is from a published study and allows 1 log growth of LM during the refrigerated shelf life, and the result from SECTION II is Substantiated, circle the score provided on the appropriate row (published study and 1 log growth), which in this case is 4. Table 2 Control Measure Feature Criteria1 Inconclusive Substantiated Conclusive Antimicrobial growth suppressing agent or process Shelf-life study of the product using the antimicrobial agent or process Less than or equal to 1 log (0) (5) (10) More than 1 log but not more than 2 log (0) (3) (5) More than 2 log (0) (0) (0) Modeling program specific to the AMAP used in the product (e.g. Purac) Less than or equal to 1 log (0) (5) (10) More than 1 log but not more than 2 log (0) (3) (5) More than 2 log (0) (0) (0) Published study using an antimicrobial agent Less than or equal to 1 log (0) (4) (8) More than 1 log but not more than 2 log (0) (2) (4) More than 2 log (0) (0) (0) Extrinsic and Intrinsic characteristic Frozen at <4\u00ba C (31.3\u00ba F) (0) (5) (10) Aw < 0.92 (0) (5) (10) pH < 4.39 (0) (5) (10) 1 Criteria: Log growth of Listeria monocytogenes (Lm)","Updated Compliance Guidelines May 2006 85 SECTION III-Sanitation Program Product (Group) Name: \_\_\_\_\_ For the following questions, please place an X in the appropriate response column. Please note that the \u201cN\A\u201d response only applies to certain questions. (NOTE: Review establishment Sanitation program or prerequisite program for the sanitation procedures used and the food contact surface (FCS) testing program (testing frequency, number of sites, hold and test, etc). If needed, please refer to the establishment\u2019s FSIS Form 10,240-1 to answer these questions and use your best judgment based on how the process is being controlled in accordance with 9 CFR 430). Rate and score responses using the scoring instructions at the end of these questions.) A. Sanitation Procedures Questions Yes No Not Sure N\A 1. Are employee hygiene procedures available in a written document? 2. Are employees trained in hygiene procedures? 3. Are gloves used properly (e.g., are they disposed of when leaving processing line and when touching anything other than product or food contact surface)? 4. Are outer garments removed when leaving RTE area? 5. Do the employees use a 20 second hand wash (or comparable method of sanitizing) before starting and returning to work? 6. Are food and operator hand tools stored in a sanitary manner? 7. Are traffic patterns established to eliminate movement of personnel between the raw and RTE areas or controlled to prevent crosscontamination? 8. Are traffic patterns established to eliminate movement of equipment between the raw and RTE areas or controlled to prevent crosscontamination? 9. Are the raw and RTE areas physically separated (e.g., by a wall, etc.)? 10. If raw and RTE areas are not

physically separated, is the potential for cross contamination minimized? (Note: If \u2018yes\u2019 to question 9 above, place an X on N\A.) 11. Are different utensils used in the raw and RTE areas, or if different utensils are not used, are utensils washed and sanitized between raw and RTE processing? 12. Are garments worn in RTE areas readily distinguished from those used in the raw areas? 13. Are maintenance employees restricted from the RTE areas during operation or are hygienic practices followed if access is needed during operation? 14. Do tools and equipment for maintenance used in the RTE area remain in the RTE area or are tools used in another area sanitized before use in another area? 15. Are the thermometers, maintenance tools and equipment cleaned and sanitized before use? 16. Are all materials for discard (trash and waste) removed at clean up (mid-shift, end-shift, etc.)? 17. Is equipment cleaned at the end of operation to remove food and other debris? (Note: In establishments conducting extended operations, clean-up operations may occur at a frequency of less than daily.) 18. Is equipment such as slicers and dicers with blades disassembled for thorough cleaning at the end of the operation? (Note: If slicers or dicers", "Updated Compliance Guidelines May 2006 86 Questions Yes No Not Sure N\A are not used, place an X on N\A.) 19. Are equipment and floors sanitized after being rinsed? 20. Is sanitizer for equipment and floors used in the concentration specified where used? 21. Are operations discontinued during construction, or are the areas under construction or remodeling isolated to prevent contamination of other areas of operation? (Note: Place an X on N\A only if there is no construction.) B. Sanitation Testing Questions Yes No Not Sure N\A 1. Does the sanitation program or prerequisite program provide for testing FCS in the post-lethality processing environment? 2. Does the sanitation program or prerequisite program identify the conditions under which the establishment will implement hold-and-test procedures following a FCS test that is positive for Listeria-like, Listeria spp., or L. monocytogenes? 3. Does the sanitation program or prerequisite program state the frequency for testing? 4. Does the sanitation program, prerequisite program or other recordkeeping system identify the location of sites for sampling? 5. Does the sanitation program or prerequisite program identify the size of sites for sampling? 6. Are the selected locations of the sites the most probable area for contamination? 7. Is the size of the sampling area at least 1-square foot if surface allows? 8. Are all possible FCS sampling sites identified? 9. Does the sanitation program or prerequisite program explain why the testing frequency is sufficient to ensure effective control of Listeria-like, Listeria spp., or L. monocytogenes? 10. If a FCS tested positive for Listeria-like, Listeria spp., or L. monocytogenes, were the hold-and-test procedures implemented as written in the sanitation program? (Note: If FCS tested negative, place an X on N\A.) 11. If FCS tested positive for Listeria-like, Listeria spp., or L. monocytogenes, were measures taken to prevent recurrence? (Note: If FCS tested negative, place an X on N\A.) 12. If FCS tested positive for Listeria-like, Listeria spp., or L. monocytogenes, were corrective actions taken to identify and eliminate the source of contamination? (Note: If FCS tested negative, place an X on N\A.) 13. If a FCS tested positive for L. monocytogenes, was the lot of product affected destroyed or reworked with a process that eliminates L. monocytogenes? (Note: If FCS tested negative, place an X on N\A.) 14. Were the results of the product testing documented? 15. Were non-FCS tested for Listeria-like, Listeria spp., or L. monocytogenes? 16. Was follow up testing conducted on all non-FCS that tested positive for Listeria-like, Listeria spp. or L. monocytogenes? (Note: Place an X on N\A only if there is no positive follow-up non-FCS test or no positive non-FCS test.)", "Updated

Compliance Guidelines May 2006 87 Complete the next table only for an establishment that produces deli or hotdog product in Alternative 3. (Questions reflect regulatory requirements for these products.) Questions Yes No Not Sure N\A 17. Was follow-up testing conducted on the FCS site that tested positive for Listeria-like, Listeria spp., or L. monocytogenes to verify that the corrective actions after an initial positive test on a FCS were effective? Note: Place an X on N\A only if there is no positive follow-up FCS test. 18. Was follow-up testing conducted on the FCS area surrounding the FCS site that tested positive for Listeria-like, Listeria spp., or L. monocytogenes to verify that the corrective actions after an initial positive test on a FCS were effective? Note: Place an X on N\A only if there is no positive follow-up FCS test. 19. If a second follow-up FCS tested positive for Listeria-like or Listeria spp. on follow-up testing, were lots of affected product held? Note: Place an X on N\A only if there is no second follow-up positive FCS test. 20. If the second follow-up FCS tested positive for Listeria-like, Listeria spp. on follow-up testing, were the affected lots of product tested for Listeria-like, Listeria spp. or L. monocytogenes? Note: Place an X on N\A only if there is no second follow-up positive FCS test. 21. If a second follow-up FCS tested positive for L. monocytogenes on follow-up testing, were the affected lots of product destroyed or reworked with a process that is destructive of L. monocytogenes? Note: Place an X on N\A only if there is no second follow-up positive FCS test. 22. If the second follow-up FCS tested positive for Listeria-like or Listeria spp. on follow-up testing, did the sampling method and frequency provide a level of statistical confidence that ensured that each lot was not adulterated with L. monocytogenes? (e.g., is the sampling method and frequency based on a statistical sampling plan such as the ICMSF) Note: Place an X on N\A only if there is no second follow-up positive FCS test. You have completed this section. Please rate this section. Rating: Conclusive: A. Sanitation Procedures For all establishments, \u201cYes\u201d or \u201cN\A\u201d answers to all questions B. Examples: potassium lactate, sodium diacetate, which limit the growth of LM. Antimicrobial Process An operation, such as freezing that is applied to an RTE product that has the effect of suppressing or limiting the growth of a microorganism, such as LM, in the product throughout the shelf life of the product, (9CFR 430.1). Other examples are processes that result in a pH or water activity that suppresses or limits microbial growth. Challenge Study A study that documents the adequacy of control measures in a process. This involves inoculating the target organism (e.g., LM) into a product to determine the effect of control measures such as post-lethality treatment or antimicrobial agent or process on the reduction or growth of the organism. Challenge studies are usually performed in a laboratory to avoid the possible spread of contamination in an establishment. They are also performed under laboratory conditions, which means that the scale of the study is adjusted, based on the capacity of the laboratory (i.e. fewer products may be tested, and a water bath may be used rather than a hot-water pasteurizer). The number of organisms before and after the application of the control measure is counted to determine the effect of the control measure. The study determines the effect using different processing variables such as time, temperature, pressure, concentration, acidity, pH and others. If challenge studies are

used as supporting documentation by the establishment, it is important that they use product that has similar physical characteristics to that being produced by the establishment (i.e., pH, Aw, etc.) and processing (and intervention) steps that are similar to those utilized by the establishment. For example, for a post-lethality treatment like steam pasteurization or hot water pasteurization, the time and temperature of treatment similar to that used for the product itself may be critical components of a challenge study. For high pressure pasteurization, pressure is a critical variable. For the use of chemical additives as antimicrobial agents, pH, acidity, and concentration may be additional critical variables. Challenge studies used for validation may or may not be published in scientific journals, and can be 1) conducted for any product; 2) conducted for an establishment's specific product or processing; or 3) conducted by the manufacturer of an equipment or chemical additive for use in the processing of a product. Challenge studies conducted for an establishment's specific product or a manufacturer's equipment or chemical additives have the advantage of using the same formulation, procedure and critical factors of moisture, pH, time, temperature, pressure, etc. as those used in the establishment. However, most of these challenge studies are not published. Published studies have the advantage of being peer-reviewed before publication, but may not be specific for an establishment's product or processing. Microbial Pathogen Computer Modeling (MPCM) Program A modeling program is a mathematical model describing the growth characteristics of pathogens in foods subjected to different environmental (product factors such as pH, salt, phosphates, nitrites, and water activity, and extrinsic factors such as temperature and culture atmosphere) and processing conditions. Computer-based microbial modeling programs may be used to provide an estimate of the influence of each limiting agent or combination of agents during processing. A computer model is a predictive tool and must be evaluated in terms of relevance and validity to the product in question. An establishment should verify the model's predictions for the establishment's product and conditions of processing by conducting tests, such of product and food contact surfaces, to confirm whether conditions are adequately controlled, as predicted. Of note, some modeling programs may identify zero growth as allowing up to 1 log growth, as a consequence of measurement error. Establishments should be aware of this when relying upon such assumptions." "Updated Compliance Guidelines May 2006 94 Products Covered by 9 CFR 430 All post-lethality exposed RTE meat and poultry Examples: deli meat, hotdog, jerky, chicken nuggets Products Not Covered by 9 CFR 430 Cook-in bag and shipped products Hot-filled products Partially cooked products Commercially sterile, thermally processed products Post-lethality Exposed Product Ready-to-eat product that comes into direct contact with a food contact surface after the lethality treatment in a post-lethality processing environment (9 CFR 430.1). Examples of post-lethality exposed products: hotdogs after the casings are removed; cooked roast beef after removing the cooking bag. Post lethality Processing Environment The area in an establishment into which product is routed after having been subjected to an initial lethality treatment (CFR 430.1). Examples are the production area where hotdog casings are peeled, or products are sliced and re-bagged. Post-lethality Treatment (PLT) A lethality treatment that is applied or is effective after post-lethality exposure. It is applied to the final product or sealed package of product in order to reduce or eliminate the level of pathogens resulting from contamination from post-lethality exposure (9 CFR 430.1). Examples: hot water pasteurization, steam pasteurization, high pressure processing. Pre-packaging Post-lethality

**Treatment** This is a post-lethality treatment that is conducted prior to packaging. Most PLT are conducted after the product is repackaged. Because the PLT is applied before packaging, the product can be exposed to recontamination after the treatment. The establishment has to include methods to demonstrate, with high confidence, that recontamination does not occur. Some of the methods include placing packaging right after the treatment by physically placing the packaging equipment next to the treatment equipment, having aseptic environmental controls, including micro-filtered air flow and positive\ negative air pressure, as well as mechanisms for ensuring equipment does not become contaminated within the packaging room. Published Study A challenge or inoculated pack study conducted by scientists, subsequently reviewed by other scientists knowledgeable in the subject (peer-reviewed), before publishing in a scientific journal. Shelf life Study A shelf life study is one that measures the increase or decrease in the number of the target organism or pathogen during storage. For an antimicrobial agent or process (AMAP), a shelf life study is important because it determines the time (in days) at a slightly abusive refrigerated storage temperature (e.g., at 45 degrees Fahrenheit) that the number of LM increases, signifying growth. A slightly abusive temperature is used in order to ensure that if LM is present and viable, growth will occur and can be measured throughout shelf-life. This slightly abusive temperature also represents the worse-case conditions that could occur during cold-chain storage and handling. Validation Validation is a process of demonstrating that the HACCP system, if operated as designed, can adequately control identified hazards to produce a safe product. Validation consists of a scientific or technical justification or documentation of control, and an initial demonstration proving that the system will perform as expected. Validation can be derived from a challenge study, a published study from a peer-reviewed scientific journal, modeling program, data underlying published guidelines, or establishment data.", "Updated Compliance Guidelines May 2006 95 The documentation must identify the hazard and the pathogen, including the level of hazard prevention or pathogen reduction to be achieved, and all associated factors or conditions should identify which processing steps will achieve the specified reduction or prevention, and how these processing steps will be monitored. The scientific or technical basis should be related to the specific hazard or pathogen and should identify specific control parameters. The demonstration should be conducted in the plant using the parameters in the validation. As part of the demonstration, the establishment should observe, measure, and record results and should show that the plant can routinely meet the parameters in order to control the hazards.

**EXAMPLES OF CHALLENGE STUDIES** When faced with a challenge study on file to document validation, it is important to look at the title and the abstract or summary first. The abstract at the beginning of the document always give the most important findings of the study. Look for the objective, the procedure or conditions used and the results. Sometimes the equipment used is also included in the abstract. The abstract usually gives the critical factors (e.g., time, temperature, pH, concentration, pressure), the initial level of pathogens or organisms and how these factors affected the level of pathogens or organisms, and whether there was reduction, suppression or no effect. For important information not found in the abstract, look or read the other sections of the document. The Materials and Methods section includes the microorganisms used and microbial inoculation method, postlethality treatment procedure, and data analysis. The Results and Discussion section gives the results, tables, graphs, pictures, and the authors\u2019 explanation and discussion of the results. The Conclusions section gives

the overall result of the study, conclusions based on the conditions of the study and recommendations. Sometimes the conclusions are included in the end of the Results and Discussions section. The following are summaries of challenge studies for post-lethality treatment and antimicrobial agents taken from the Compliance Guidelines for the Listeria rule (FSIS website). The summaries include the conditions for post-lethality treatments or addition of antimicrobial agents and the resulting time, temperature pressure or concentration to control *L. monocytogenes*. The critical variables of time, temperature, pressure, concentration or pH, as well as the procedure or equipment that are bolded are the important information that needs to be determined when reading or scanning a challenge study. These variables are the ones used for the CCP and critical limit. Noting down the information gathered from the abstract or summary as shown for the first challenge study would help in determining if the establishment is using the same or similar procedure, equipment and critical factors as the challenge study.

**A. Steam Pasteurization and Hot Water Pasteurization (Important information for validation are bolded)**

Studies by Murphy et al. (2003) showed that post-cook hot water pasteurization and steam pasteurization resulted in a 77 log reduction of *L. monocytogenes* in surface inoculated vacuum packaged fully cooked chicken fillets and strips. The reduction was effective when single packaged breast fillets, 227 g- packaged strips and 454 g-packaged strips were heat treated at 90°C in a pilot scale steam cooker or hot water cooker for 5, 25 and 35 minutes, respectively.

Information gathered from the summary or abstract:

Post-lethality treatment: hot water pasteurization or steam pasteurization

Products: fully cooked chicken breast fillets and strips

Procedure: fully cooked products were surface inoculated with *L. monocytogenes*, vacuum packaged and pasteurized

Equipment used for the pasteurization treatment: Steam pasteurization: pilot-scale steam cooker

Hot water pasteurization: pilot-scale hot water cooker

Temperature of pasteurization: 90°C

Reduction of *L. monocytogenes*: 7 log reduction

Products and time of pasteurization that resulted in 7 log reduction", "Updated Compliance Guidelines May 2006

96 Product Time of pasteurization (min)

Single-packaged breast fillets 5 227g-package strips 25 454 g-packaged strips 35

Murphy, R.Y., L. K. Duncan, K.H. Driscoll, B.L. Beard, M. E. Berrang and J.A. Marcy. 2003. Determination of thermal lethality of *Listeria monocytogenes* in fully cooked chicken breast fillets and strips during post cook in-package pasteurization. *J. Food Protect* 66:578-583.

**B. High Hydrostatic Pressure Processing (Important information for validation are bolded)**

High pressure processing (HPP) is one of the new technologies used for food processing. This technology provides a means of ensuring food safety for those products that are difficult to be heat treated due to organoleptic effects. HPP was shown to inactivate pathogens without any thermal or chemical effects and at the same time preserve the quality of the product. Raghubeer and Ting (2003) evaluated the efficacy of high hydrostatic pressure processing in inactivating *L. monocytogenes* in retail-packaged samples of sliced ham, turkey and roast beef obtained from a manufacturer and repackaged in 25-g portions. Results show that an inoculum of about 10<sup>4</sup> *L. monocytogenes* cocktail in these 3 products and HPP treatment at 87,000 psi for 3 minutes showed no recovery of *L. monocytogenes* after 61 days of storage at 34°F. There were no pressure-injured cells detected. There were no adverse organoleptic effects detected on the 3 HPP treated products during the 61-day shelf life study. No signs of spoilage were seen on all 3 products after 61 days of storage, and for 100 days for ham and turkey. According to the investigators, the normal shelf life of these products is 30 days, so the HPP treatment extended

the shelf life of the products. Raghubeer, E.V. and E.D. Ting. 2003. The Effects of high hydrostatic pressure (HPP) on Listeria monocytogenes in RTE meat products. Avure Technologies, Inc. Submitted for publication. C. Studies on the Use of Antimicrobial Agents (Important information for validation are bolded) Bedie et al., (2001) evaluated the use of antimicrobials, included in frankfurter formulations, on *L. monocytogenes* populations during refrigerated storage. Fully cooked and cooled frankfurters were inoculated with 103 to 104 CFU /cm<sup>2</sup> of *L. monocytogenes* after peeling and before vacuum packaging. Samples were stored at 4°C for up to 120 days and sampled for testing on assigned days. Results are as follows: ANTIMICROBIAL LEVEL (%) L. MONOCYTOGENES GROWTH INHIBITION Sodium lactate 3 70 days no pathogen growth Sodium diacetate 0.25 50 days no pathogen growth Sodium acetate 0.25, 0.50 20 days no pathogen growth Sodium lactate 6 120 days no growth and reduced pathogen growth Sodium diacetate 0.5 120 days no growth and reduced pathogen growth Inoc. Control 0.0 Increased to 6 logs in 20 days Note: Sodium acetate is approved as a flavor enhancer, not as an antimicrobial agent. No pathogen growth refers to zero increase in the number of inoculated *L. monocytogenes* cells (bacteriostatic); while reduced pathogen growth refers to a decrease in the number of inoculated *L. monocytogenes* cells (bactericidal) in the product. In this study, tables showed the reduction varied with storage days, but was up to 1.0 log on some days. Levels of sodium lactate at 6.0 % and sodium diacetate at 0.5 % showed a reduction of the pathogens, however these levels are above the permitted levels.", "Updated Compliance Guidelines May 2006 97 Bedie, B. K., J. Samelis, J.N. Sofos, K. E. Belk, J. A. Scanga, and G. C. Smith . 2001. Antimicrobials in the formulation to control *Listeria monocytogenes* postprocessing contamination on frankfurters stored at 4°C in vacuum packages. *J. Food Protect.* 64:1949-1955 This study by Samelis et al., (2002) used similar treatments, processing and inoculation procedures and frankfurter formulations as the previous study described above. However, in this study combinations of antimicrobials were used, and in combination with hot water treatment. Therefore this is a combination of post-lethality treatment and antimicrobial agent. Hot water treatment involved immersion of frankfurters, with two product links in a package to 75 or 80°C for 60 s. Storage at 4°C shows: TREATMENT LEVELS (%) L. MONOCYTOGENES GROWTH INHIBITION Sodium lactate 1.8 35-50 days no growth Sodium lactate + sodium acetate 1.8 0.25 120 days no growth; 35-50 days growth reduction Sodium lactate + Sodium diacetate 1.8 0.25 120 days no growth; 35-50 days growth reduction Sodium lactate + Glucuno-delta-lactone 1.8 0.25 120 days no growth, 35-50 days growth reduction Hot water treatment (80°C, 60 s) + Sodium lactate 1.8 Inoc. population reduced by 0.4-0.9 log CFU/cm<sup>2</sup>, and 50-70 days growth reduction by 1.1-1.4 CFU/cm<sup>2</sup> Hot water treatment (80°C, 60 s) Increase in growth to about 6-8 logs in 50 days Inoculated Control, no treatment Increase in growth to about 6 logs in 20 days and 8 logs thereafter up to 120 days Note: Sodium lactate was used as a 3 % of a 60 % (wt/wt) commercial solution. Glucuno-delta lactone is approved as an acidifier, and a curing accelerator, but not as antimicrobial. Sodium acetate is approved as a flavor enhancer, not as an antimicrobial agent. Samelis, J. G.K. Bedie, J.N. Sofos, K.E. Belk, J.A. Scanga, and G.C. Smith. 2002. Control of *Listeria monocytogenes* with combined antimicrobials after post-process contamination and extended storage of frankfurters at 4°C in vacuum packages. *J. Food Protect.* 65: 299-307.", "Updated Compliance Guidelines May 2006 98 ATTACHMENT 8 GUIDANCE DERIVED FROM A REVIEW OF COMPREHENSIVE FOOD SAFETY ASSESSMENTS ASSOCIATED WITH

**COMPLIANCE WITH 9 CFR 430** Since 2004, FSIS conducted comprehensive Food Safety Assessments (FSA) by Enforcement, Investigations, and Analysis Officer (EIAO) in which the design and execution of the food safety systems were assessed, with a specific focus on Listeria monocytogenes in ready-to-eat (RTE) products. From June 2004 through September 2005, a total of 195 FSA reports directly related to 9 CFR 430, the Listeria monocytogenes regulations on post-lethality exposed RTE products, were further reviewed by the Office of Policy, Program and Employee Development. The OPPED review was performed in order to glean from the reports the design and execution features of the associated food safety systems that may have contributed to weak control measures. OPPED has summarized the significant features that may be helpful for the RTE industry, particularly small and very small establishments, in order for the industry to focus attention and enhance their control measures for *L. monocytogenes*.  
**Summary of Findings and Recommendations** The three failures common to most of the establishments reviewed from 2004 to 2005, regardless of the establishment-selected 9 CFR 430 control measure (i.e., Alternatives 2 or 3; there were no noted failures associated with Alternative 1), were: 1) not identifying *L. monocytogenes* in the hazard analysis; 2) not explaining how the food contact surfaces (FCS) were identified and selected and how the testing frequency was established; and 3) not providing hold and test procedures in the event of a *Listeria* spp. or *L. monocytogenes* finding by the establishment. Alternative 2: In addition to the 3 failures common to most of the establishments mentioned above, some establishments selecting Alternative 2 did not identify the control method (e.g., freezing) used, provide supporting documentation for the control method, follow the written cleaning and sanitizing frequencies, or address and control condensation problems in processing areas where product is post-lethality exposed. Alternative 3: In addition to the 3 failures common to most of the establishments mentioned above, some establishments selecting Alternative 3 were found to have a number of problems with designing and implementing a sanitation program to meet the requirements of 9 CFR 430, in addition to meeting the requirements of 9 CFR 416.

Establishments that selected Alternative 3 for their products had problems with the sampling plan described in their sanitation program to control *L. monocytogenes*, such as its implementation, identifying the location and size of their sampling sites, failure to identify and incorporate all food contact surfaces in their program, failure to include non-food contact surfaces such as cooling racks, wire trays, cooler walls, and tubs used to hold open bags of RTE products as potential sampling sites. **Corrective Actions:** For the three most common failures, the following corrective actions were identified and taken by many of the establishments and likely contributed to resolving regulatory enforcement actions: 1. *L. monocytogenes* is not identified in the hazard analysis as a hazard reasonably likely to occur. FSIS, through 9 CFR 430, believes that *L. monocytogenes* is a hazard reasonably likely to occur in post-lethality exposed RTE meat and poultry products. As such, the hazard analysis should list *L. monocytogenes* either as a hazard reasonably likely to occur or as a hazard not reasonably likely to occur. In either case, the associated control measures need to describe what control measures are in place to support this finding. This does not automatically mean that a critical control point is required. If the control measure does not eliminate, prevent, or reduce *L. monocytogenes* to an acceptable level, the controls can be addressed in the Sanitation SOP or other prerequisite program. The exception is that for application of a post-lethality treatment (as in Alternative 1 and", "Updated Compliance Guidelines May 2006 99 2), 9 CFR 430 requires the treatment to be

identified in the HACCP plan only and not in the Sanitation SOP or other prerequisite program. 2. The sanitation program does not explain how the FCS were identified and selected and how the testing frequency was established. If an establishment chooses either Alternative 2 or 3, the sanitation program for that establishment must provide for testing of FCS in the post-lethality processing environment, identify the frequency for testing, and provide an explanation of why the testing frequency is sufficient to ensure the effective control of L. monocytogenes or indicator organisms (430.4(b)(2)(iii)(A), (C), and (E) and 430.4(b)(3)(i)(A), (C), and (E)).

Identifying the FCS is simply determining the surfaces to which the product is exposed post-lethality. In addition to the equipment surfaces that contact the product post-lethality, other FCS may include knives that are used to slice the product, thermometers inserted into the product after the lethality process, or other surface that compromises the product integrity. For the testing frequency, the establishment has the options of either setting and justifying their own testing frequency or using the testing frequency recommended in the Compliance Guidelines for the control of L. monocytogenes. Whether establishments use their own or the Compliance Guideline testing frequency, the establishment still needs to have a justification on file as part of the validation support for the food safety system that provides a rationale for why the selected level of testing frequency is sufficient to demonstrate that L. monocytogenes is appropriately controlled. 3. The sanitation program did not provide hold and test procedures in the event of a FCS testing positive Listeria spp. or L. monocytogenes. If a FCS tests positive for L. monocytogenes, the product that came in contact with that surface is considered adulterated according to 9 CFR 430 and must be destroyed or treated with a process sufficient to destroy L. monocytogenes. In this case, a hold and test procedure would not be necessary for the lot in question. However, if the establishment or inspection program personnel have reason to believe that product lots other than those immediately identified may have become contaminated, the establishment should have hold and test procedures for the other product lots. On the other hand, if a FCS tests positive for an indicator organism (e.g., Listeria spp. or Listerialike organisms), the establishment producing products under Alternative 2 or non-hotdog or deli meat products under Alternative 3 must define conditions under which they will implement their hold and test procedures. Hold and test procedures for hotdog and deli meat products are described under 430.4(b)(3)(ii). For other common deficiencies in program design, the following corrective actions were identified and taken by many of the establishments and likely contributed to resolving regulatory enforcement actions:

\u2022 The establishment fails to identify the post-lethality treatment or antimicrobial treatment or process. It is the responsibility of the establishment, not the Agency, to determine the Alternative that applies to their product. However, in doing so, the establishment must provide justification for their determination. Also, the effectiveness of the post-lethality treatment or antimicrobial agent or process must be validated. For example, an establishment cannot simply declare that a process is Alternative 1 or 2 if documentation isn\u2019t available on file with the food safety system to provide the rationale for how the treatment and/or process reduces the level of L. monocytogenes and/or suppress its growth.

\u2022 The establishment\u2019s post-lethality treatment is not validated or the establishment cannot provide supporting documentation for the effectiveness of the antimicrobial agent or process or the postlethality treatment.

Validation of the post-lethality process and documentation to support the effectiveness of the antimicrobial agent or process are requirements of 9 CFR 430(b)(1)(ii) and (b)(2)(ii). The

supporting documentation can be a challenge study on the specific product, journal article on a process that is", "Updated Compliance Guidelines May 2006 100 used by the establishment, or the Compliance Guidelines with rationale to support the effect of the treatment or process. For the antimicrobial agents pH, water activity, and temperature, the Compliance Guidelines can be used as supporting documentation if these factors are below the levels listed that allow growth of L. monocytogenes. \u2022 The establishment did not identify the location and size of FCS sampling sites. The location of the sampling sites should be determined in conjunction with the requirement to provide testing of FCS. Documenting the location of the sampling sites also assists in determining the thoroughness of the sampling plan. One square foot of FCS or non-FCS, if available, is the minimum area recommended for sampling in the Compliance Guidelines. A prudent plant could use the Compliance Guidelines as the minimum testing amount to ensure the effectiveness of their sanitation program while conducting on-going verification to demonstrate that the level and frequency of testing is sufficient to find insanitary conditions and, when found, adequately controlled to prevent product adulteration. Failures in the implementation of L. monocytogenes food safety programs were attributable to either not implementing the program or not applying the program as written. Either case is comparable to not developing a program \u2013 the establishment cannot ensure the effectiveness of their control for L. monocytogenes or indicator organism in the post-lethality environment. Failures of program implementation noted in many of the establishments were: not following sampling programs as described in the establishment\u2019s plan including failure to test FCS or include all FCS, failure to document corrective actions; not isolating or separating the processing area from construction; and not following the written sanitization procedures. Failures in implementation can be addressed by effective training the employees accompanied by supervision to ensure they are performing the tasks as described in the program. If an employee is observed to be incorrectly performing their tasks, re-training may be needed. In responding to failures in program design or implementation, an establishment should not limit the corrective actions to just meeting the minimum requirements or recommendations. The establishments should strive to develop a program that is the most effective in controlling L. monocytogenes or an indicator organism. For example, one establishment responded by extending sample collection to food contact surfaces prior to the start of processing. This practice would provide the establishment with the effectiveness of their equipment cleaning and sanitizing measures to eliminate L. monocytogenes or indicator organism.", "Updated Compliance Guidelines May 2006 101 ATTACHMENT 9 GUIDANCE DOCUMENTS FOR VALIDATION 1. 1775"]}, {"file\_name": "FSIS\_GD\_2005\_0005", "title": "Water Reuse Questions and Answers (Q&As)", "num": "FSIS-GD-2005-", "id": "d0ce1b2794fc405d3fd262b73d736b2e6524a226324d2690c974800ce9e4fecf", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-"}]

guidelines","url":"https:\V\www.fsis.usda.gov\sites\default\files\import\Water\_Reuse\_QA.pdf","type":"pdf","n\_pages":7,"word\_count":2662,"text\_by\_page":["United States Food Safety Office of Policy, Program, Washington, D.C. Department of and Inspection and Employee Development 20250 Agriculture Service Company Name Address Address Dear Sir\Madam: This letter is in regard to approved labels for uncooked, breaded, boneless poultry products that also may be stuffed or filled, charmarked, or artificially colored that are currently manufactured by your establishment. Products of these types are similar to the products associated with the recall that was posted on the Food Safety and Inspection Service\u2019s (FSIS) website on March 10, 2006, involving frozen stuffed chicken entrees. As noted in the recall notice, the frozen state, labeling, and cooked appearance of the uncooked chicken products may have caused consumers to believe that they were precooked. What we know is that these products were not cooked by consumers to a safe internal temperature. FSIS is concerned that the labeling of products of this type be adequate to inform the public of the manner of handling required to maintain the products in a wholesome condition and to prepare them safely. Moreover, the cooking instructions need to be validated to address the intended use by the consumer. While consumers may be directed to cook the products to an internal temperature of 165 degrees Fahrenheit (F), if they are directed to use a cooking method that is not practical or not likely to achieve the necessary level of food safety (e.g., microwaving or cooking frozen product in a toaster oven), the cooking instructions may not be valid. A fundamental part of label evaluation is to ensure that labeling will be understood and followed by consumers. It is clear from the recent events that labels for other uncooked, breaded, boneless poultry products on the market, such as those that your company produces, may not be understood or followed by consumers. This lack of understanding may result in the consumers not cooking the products to the minimum internal temperature (165 degrees F) necessary for the destruction of foodborne bacteria, even though the cooking instructions on the product labeling tell them to do so. Given what the Agency learned in the recent recall and the nature of these products, the labeling of such products may not be eligible to bear the mark of inspection if the labeling does not lead consumers to provide the lethality that is necessary. The mark of inspection on poultry (and meat) products signifies that the product, as labeled, is safe and wholesome, and that the label is not misleading. It is our strong recommendation that the labeling of the types of products in question, which are currently manufactured by your establishment, be modified to emphasize that the products are not cooked. Further enhancement of the cooking instructions and validation that lethality is achieved with all the methods of cooking preparation that are declared on the labels are necessary in our view. The Agency views the statement","2 Company Name \"Uncooked: For Safety, Must be Cooked to an Internal Temperature of 165 degrees F as Measured by Use of a Thermometer\" to be the type of statement that seems appropriate on the principal display panel of the packaging to help consumers understand the need for the safe preparation of the products on their part. It is likely that, by improving the cooking instructions, as well as documenting that cooking methods are validated as part of the official labeling record, a situation like the one that led to the recent recall could be avoided. Certain to be of assistance to your company in making the necessary changes to product labeling and cooking method validation will be the work of the Subcommittee on Consumer Guidelines for the Safe Cooking of Poultry Products of the National Advisory Committee on Microbiological Criteria for Foods (NACMCF) which will meet on March

22, 2006, in Arlington, Virginia. We suggest that the recommendations that are developed by the NACMCF serve as a guide for the modifications that are needed to the labels for your products such that the subject products can be assured to result in safe and wholesome products, and that the revised labeling is not misleading. In light of the concerns outlined in this letter, we are requesting that you submit the revised labeling for the products in question to the Agency for evaluation of the necessary modifications and re-approval by May 1, 2006. If we do not receive the modified labeling submissions by that time, the labels for the subject products will be deemed to be rescinded. If you have any questions about this matter, please do not hesitate to contact me or Rosalyn Murphy-Jenkins at Area Code (202) 205-0279.

Sincerely, Dr. Robert C. Post, Director Labeling and Consumer Protection

The Labeling and Consumer Protection Staff Office of Policy, Program, and Employee Development Food Safety and Inspection Service U.S. DEPARTMENT OF AGRICULTURE August, 2007 Work performed under contract by Hogan & Hartson, LLP Washington, DC", "DISCLAIMER This Guide is designed as a user-friendly introduction to the basic food labeling requirements for meat, poultry, and egg products. It does not represent, nor should it be relied upon as, an official or binding statement by the Labeling and Consumer Protection Staff, LCPS), Office of Policy, Program, and Employee Development (OPPED), of the Food Safety and Inspection Service (FSIS) of the U.S. Department of Agriculture (USDA). Users should consider changes in FSIS regulations and policies arising after the Guide\u2019s publication date. \* \* \* The impetus for the Guide was to create a user-friendly, comprehensive guide to assist food companies in the development of food labels that comply with the array of requirements policies. While not a substitute for careful review of the requirements referenced throughout, the Guide will provide the reader with a useful tool to identify and understand those requirements that shape the food label presented to consumers. Note: Guidance on egg product, labels can be found in Appendix A of this Guide. Building from the expertise and experience of the Labeling and Consumer Protection Staff, OPPED, the Agency sought to utilize a contractor who would offer an understanding of the rules in practice. The reader benefits from the day-to-day learning\u2019s of those who are involved in the review and approval of labels and others who routinely assist companies in the application of the labeling rules. LCPS developed the scope and content of this Guide under a contract with Hogan & Hartson, LLP, Washington, DC. The Agency recognizes the contributions of the staff who served as editors and provided oversight in the creation of the Guide: Robert C. Post, Ph.D. MEd., MSc., Catherine Budak, Food Technologist, Jeffery Canavan, Food Technologist, Tawana DuncanHarrington, Program Analyst, Bill Jones, Chemist, Sally Jones, Senior Technical Advisor, Rosalyn Murphy-Jenkins, Senior Technologist, Tammie Myrick, Food

Technologist, Mark Wheeler, Biological Scientist, Patricia White, Nutritionist, and Lynn Yoder, Program Analyst, Marlene Kegley, Program Analyst, served as contract coordinator. The contributions of attorneys at Hogan & Hartson, LLP in drafting the Guide are also acknowledged: Steven B. Steinborn, Ryan Shadrick-Wilson, Lorrin H. Tuxbury, Robert O. Winters, and Elizabeth B. Fawell.

companies and consumers alike. A company\u2019s most direct (and sometimes only) way to		
communicate with the consumer is via the food label. For consumers, the food label contains a		
wealth of information, which allows for informed purchase decisions. The U.S. Department of		
Agriculture (USDA), by statute, is charged with assuring that meat and poultry products in		
interstate or foreign commerce, or that substantially affect such commerce, are wholesome,		
not adulterated, and properly marked, labeled and packaged. 1 Responsibility for the		
development and application of the labeling requirements applicable to meat and poultry		
products rests principally with USDA\u2019s Food Safety and Inspection Service (FSIS). 2 FSIS is		
charged with developing the labeling policy by which it is determined if a meat or poultry		
product is misbranded or adulterated. 3 FSIS food labeling regulations have evolved over the		
years, reflecting the evolution of the food processing industry and consumer interest. Food		
manufacturers are responsible for compliance with the FSIS labeling rules and adherence to the		
process maintained by FSIS for the evaluation and approval of meat and poultry product labels.		
This Guide provides the basic information necessary to devise a label for meat and poultry		
products and to understand the regulatory process administered by FSIS. Answers to the most		
commonly asked questions are incorporated. This Guide cannot possibly anticipate or address		
the large number of issues that may arise in developing product labeling. The FSIS - 1 -		
","website ( <a href="http://www.fsis.usda.gov">www.fsis.usda.gov</a> ) is a good source of information, providing the complete		
statutes, regulations, and policies. Included throughout the Guide are cross references to the		
relevant sources, found primarily in the End Notes. Some issues, particularly policy issues, will		
often require consultation with the Labeling and Consumer Protection Staff (LCPS), OPPED,		
within FSIS. Before delving into the details, the Guide begins with an overview of the principal		
jurisdiction over the label, labeling and advertising of foods at the federal level. The scope of		
USDA\u2019s jurisdiction and statutory reach with respect to covered and exempt meat and		
poultry products is detailed. The role of the states in regulating food labeling is also addressed,		

along with an explanation of the consistency required between state and federal law. Section II provides an overview of the basic food labeling requirements, including the prior label approval process, establishment responsibilities, temporary label approvals, and other facets of the preapproval process. Sections III through XII address in detail each of the up to eight mandatory features that must be present on a meat or poultry label and other mandatory and optional information that may be on such a label. Appended to the Guide (Appendix A) is a discussion of the labeling requirements for egg products, which are also administered by FSIS. Other useful excerpts of labeling regulations and illustrations are included in various appendices as noted throughout the Guide. This Guide cannot substitute for a careful review of the underlying statutes, regulations, policies, and guidance referenced throughout the Guide. - 2 -

","Consultation of the appropriate regulation, directive, and other guidance document, as well as the FSIS website, provides valuable information on devising an acceptable and compliant food label. I. TIPS AND PITFALLS IN DESIGNING A FOOD LABEL \u2022 Begin label design with the mandatory labeling features required by FSIS regulations. Deviation from these requirements to accommodate marketing or other communication objectives does not ensure compliance. \u2022 Ensure that placement and prominence requirements for each mandatory feature of the food label are met. \u2022 Review brand names, marketing copy, and all other information presented on the label to determine if a regulated term is included. \u2022 Make sure that foods subject to a standard of identity comply with the applicable FSIS requirement. \u2022 Make sure that ingredients\components are properly declared in the ingredients statement. \u2022 Novel or innovative products that trigger unique labeling issues should not be submitted to be evaluated by FSIS staff as part of the sketch-approval process. Instead, they should be addressed through direct contact with the staff. Firms should build into the product launch schedule the time necessary to allow for agency consideration of policy issues. \u2022 Review ingredients statement for accuracy and completeness against formulation information. Fully consult ingredient suppliers to obtain all pertinent information as part of this review. \u2022 Keep labeling files complete and current. Document generic approvals and permitted modifications along with final approvals that must be retained by the firm. \u2022 Products that are not amenable and thus not subject to FSIS inspection must still comply with applicable labeling rules. Similarly, products not subject to prior approval (e.g., retail labeling) also must comply with applicable labeling requirements. \u2022 Fully consult the resources available at the FSIS website and always consult the regulations, directives and other policies referenced in this Guide. - 3 -","\u2022 If a label is not accurate, the label should not be used unless a temporary approval is obtained. II. INTRODUCTION TO FOOD LABELING A. The Federal Agencies and Their Statutory Authority to Regulate Food Labeling The federal regulatory agencies that have jurisdiction over food products derive their authority to govern the labeling of these products from several principal statutes -- the Federal Meat Inspection Act (FMIA), the Poultry Products Inspection Act (PPIA), the Egg Products Inspection Act (EPIA), the Agricultural Marketing Act (AMA), the Federal Food, Drug and Cosmetic Act (FFDCA), and the Fair Packaging and Labeling Act (FPLA). In addition, food advertising \u2013 which in certain instances serves as an extension of food labeling -- is subject to regulation by the Federal Trade Commission (FTC) under the Federal Trade Commission Act, which prohibits false and deceptive advertising.

1. The United States Department of Agriculture\u2019s Food Safety and Inspection Service (FSIS) FSIS has primary responsibility for the regulation of food labeling for meat and poultry

products under the FMIA 4 and the PPIA 5 and is also authorized to regulate food labeling for exotic species of animals under the Agricultural Marketing Act of 1946. The FMIA and PPIA define the food \u201clabel,\u201d in pertinent part, as \u201ca display of written, printed, or graphic matter upon the immediate container of any article,\u201d and define \u201clabeling\u201d as \u201call labels and other written, printed or graphic matter (1) upon any article or any of its containers or wrappers, or (2) accompanying such article.\u201d 6 USDA is authorized under the FMIA and the PPIA to regulate marking, labeling, or - 4 - ", "packaging of meat, poultry, or processed parts to prevent the use of any false or misleading mark, label, or container. This broad definition makes FSIS regulations applicable to product labels and materials that accompany a product but are not attached to it, such as point-of purchase (POP) materials. 7 The scope of what constitutes a food label is discussed in further detail below. The FMIA specifies the circumstances when products are misbranded. The FMIA provides, in part, that any carcass, meat or meat product is \u201cmisbranded\u201d (1) if the product\u2019s labeling is false or misleading in any particular way; (2) if it is offered for sale under the name of another food; (3) if it is an imitation of another food, unless it is labeled as such; (4) if its container is misleading; (5) unless it bears a label with the name of the manufacturer, distributor, and net quantity of contents; (6) if its labeling is not prominent and conspicuous; (7) if it purports to be a food with a standard of identity without conforming to the standard; (8) if it misrepresents itself as a food with a standard of fill; (9) if it does not bear a common or usual name (provided it is not covered by a standard of identity) and declare ingredients by common or usual name; (10) if it purports to be a food for special dietary use without conforming to FDA regulations on such products; (11) if it contains artificial flavoring, artificial coloring, or chemical preservatives that are not declared (with exceptions); and (12) if it fails to bear an inspection legend and establishment number. 8 It is intended that these provisions apply within the scope of the exceptions that may exist in the act. FSIS has similar authority under the PPIA with regard to poultry products. 9 False or misleading labeling - 5 - ", "can trigger a charge of misbranding pursuant to the wide range of labeling requirements summarized in this Guide. If a product is deemed misbranded, its manufacturer faces a wide range of penalties that can be imposed by FSIS. 10 These include withholding (rescinding) the use of labeling; product retention (prohibiting shipment); product detention (prohibiting sale from anywhere in the chain of commerce); request for product recall, press releases, and\or fines; and criminal prosecution. In addition, the facility producing misbranded product faces the possibility of inspection suspension or withdrawal. 11 2. The U.S. Food and Drug Administration (FDA) FDA has primary statutory authority to establish labeling requirements for foods and food ingredients under its purview pursuant to the Federal Food, Drug and Cosmetic Act (\u201cFFDCA\u201d). 12 The FFDCA states, in a fashion similar to the statutes enforced by USDA, that a food product is misbranded, and is, therefore, in violation of the statute, if \u201cits labeling is false or misleading in any particular ....\u201d 13 Similar to the FSIS-enforced statutes, the FFDCA defines a \u201clabel\u201d as \u201ca display of written, printed, or graphic matter upon the immediate container of any article.\u201d 14 Further, the FFDCA defines \u201clabeling\u201d as: \u201clabels and other written, printed, or graphic matter (1) upon any article or any of its containers or wrappers, or (2) accompanying such article.\u201d 15 This broad definition makes FDA regulations applicable to product labels and materials that accompany a product but are not attached to it. In addition, FDA has - 6 -

","regulatory authority under the Fair Packaging and Labeling Act (\u201cFPLA\u201d), a companion statute to the FFDCA. 16 3. FSIS and FDA: Distinct Approaches to Labeling and Jurisdiction Prior approval by FSIS is required for all labels used for meat and poultry products before those products may be marketed in interstate commerce. There are distinct categories of prior approval, discussed below, that dictate the precise manner in which a label is \u201capproved.\u201d FSIS derives its authority for label approval from the provision in the Acts that states that no food article \u201chall be sold or offered for sale by any person in commerce under any name or other marking or labeling \u2026but established trade names and other marking and labeling and containers which are not false or misleading and which are approved by the Secretary.\u201d 17 USDA interprets this statutory language as mandating the preapproval of all food labels before products that bear the mark of inspection may be offered for sale. Responsibility for USDA\u2019s pre-market label approval process rests with the FSIS Administrator. 18 Regulations and policies establish requirements for the content and design of labeling to ensure that labeling is truthful, accurate, and not misleading in order to prevent products from being misbranded. 19 Annually, FSIS evaluates approximately 60,000 labels that are sent to the Agency for evaluation and approval before they may be applied to product destined for commerce. Many more new and revised labels are subject to prior approval but are not submitted first for evaluation by the Agency, provided manufacturers ensure that such final labels fall within the conditions - 7 -","specified in the generic labeling regulations (as elaborated upon below). In specified circumstances, labels that the Agency approved may be modified by manufacturers without resubmitting them to FSIS for evaluation. However, outside of these circumstances or instances where specific exceptions exist (e.g., for random weight packages), only labeling that has been approved by FSIS may be applied to meat and poultry products. In contrast, FDA does not require prior label approval for food products under its jurisdiction. 20 FDA has promulgated regulations establishing requirements for all aspects of labeling and monitors labeling compliance primarily through random post-marketing surveillance. FDA reviews only a small portion of labels on food products falling under its jurisdiction. FDA\u2019s label review generally arises in connection with an informal request for review by a manufacturer, a trade complaint by a competitor, a consumer inquiry, or an FDA on-site inspection of a manufacturing facility. Although FSIS has jurisdictional authority over food labeling for products containing meat and poultry, the FMIA and the PPIA explicitly authorize USDA (through FSIS) to exempt from its regulatory coverage food products which contain meat or poultry \u201conly in relatively small portion or historically have not been considered by consumers as products of the meat food industry \u2026.\u201d 21 By statute, the Secretary may (not, must) exempt product applying either of the two stated criterion. Therefore, the statutes have long been applied by the Agency as including all products containing meat or poultry under FSIS jurisdiction (and, therefore, inspection). By default, all - 8 -","other foods fall under the jurisdiction of FDA (and the statutes under which it operates), including the products of exotic species of livestock and kinds of poultry, (e.g., deer, elk, and pheasant.) 22 The determination of whether a product falls under the jurisdiction of FSIS or FDA is referred to as \u201camenability.\u201d Amenability decisions are based on how a product is formulated, not the composition of the finished product. USDA has set a rule that any food product containing the following is not subject to the FMIA or PPIA (i.e., to FSIS inspection): (1) 3 percent or less raw meat or less than 2 percent cooked meat, or (2) less than 2 percent

cooked poultry meat, less than 10 percent of cooked poultry skins, giblets, or fat, separately, and less than 10 percent of cooked poultry skins, giblets, fat, and meat in combination, (i.e., specific condition,) provided the poultry ingredients were prepared under domestic or foreign inspection and the product is not represented as a poultry product. 23 FSIS has formally adopted this rule with regard to poultry, but has not done so for meat products. Nonetheless, through decades-old policy, FSIS has applied a threshold level of meat that makes meat food products amenable consistent with the poultry regulations. Examples of meat products exempt from FSIS jurisdiction under one or the other criteria specified in the FMIA and implementing regulations include spaghetti sauces with less than 2 percent cooked meat, pork and beans, bagel dogs, and gravy mixes. Because the regulations state that the Secretary may exempt products, industry is strongly advised to seek clarification from FSIS in cases where the status of jurisdiction is in question. - 9 -,"As noted, by regulation, FSIS has further defined certain products as exempt from the definition of a \u201cpoultry product.\u201d 24 These exemptions include product that contains less than 10 percent of cooked poultry skins, giblets, or fat separately and less than 10 percent of cooked poultry skins, giblets, fat, and meat or \u201cmechanically separated skins of poultry,\u201d as defined, and are not represented as a poultry product. Other exemptions include product in an institutional pack and used as soup bases or flavorings containing less than 15 percent cooked poultry meat and provided the specified conditions (as noted above) of the regulation are met. 25 Bouillon cubes, poultry broths, gravies, sauces, and flavorings also are exempt under the specified conditions (as noted above). 26 These exemptions are null if the kind of poultry is listed in the product name without appropriate qualification. Appropriate qualification is using a term, such as \u201cflavored,\u201d that must be included as part of the product name (e.g., \u201cChicken Flavored Noodle Soup\u201d) to distinguish the food product as different than a \u201cpoultry product\u201d and, therefore, preserve the exemption. Products that meet the exemption factors and conditions, and that are labeled in this fashion, are subject to jurisdiction and regulation by FDA. 27 FSIS has concurrent jurisdiction with FDA over the setting of standards of identity for food products. 28 The FMIA and PPIA state that USDA\u2019s standards for any meat and poultry food products may not be inconsistent with standards established under the FFDCA. 29 - 10 -,"Finally, FDA has authority to approve the safety of food ingredients to be used in the production of food products, including meat or poultry products. 30 The meat and poultry inspection laws explicitly permit only FDA- sanctioned food ingredients (e.g., additives, GRAS substances, color additives) to be used in the production of meat and poultry products, which FSIS also must approve as suitable for use under prescribed conditions. 31 FSIS requirements regarding legal status as safe for use in food differ somewhat from FDA. FSIS has developed policies and procedures to streamline its evaluation and approval of ingredients in meat and poultry products through close coordination with FDA. 32 FSIS has provided a great deal of useful guidance governing permitted use of safe and suitable ingredients. Beyond the scope of the Guide, there are several regulatory references that should be consulted.33 4. The Federal Trade Commission (FTC) Section 12 of the Federal Trade Commission Act specifically states that the FTC shall prohibit the false advertisement of \u201cfoods, drugs, and cosmetics.\u201d 34 Although the definition of \u201cadvertisement\u201d excludes labeling, FTC has additional authority pursuant to section 5 of the FTC Act to prevent \u201cunfair or deceptive acts or practices in or affecting commerce.\u201d 35 This broad authority enables

FTC to proceed against all unfair business practices, including false and misleading labeling of food products. 36 The FTC Act makes the dissemination of any false advertisement an unfair or deceptive - 11 -,"practice for the purpose of inducing, or that is likely to induce, the purchase of food or having an effect on interstate commerce. 37 An advertising claim may be deemed false or misleading if it is not adequately substantiated pursuant to FTC guidelines. 38 FTC requires that companies that make claims about their products be able to substantiate these claims before they are made. FTC policy guidelines essentially provide that a representation of objective fact implies that the claimant has a reasonable basis for such fact. Different types of claims warrant different levels of substantiation. 39 The courts have explicitly upheld FTC's authority to proceed against false labeling of food products. 40 FTC has statutory authority to obtain injunctive relief, and in some instances, damages. 41 FTC may also require corrective advertising if necessary to remedy the effects of past deception. 42 Thus, FTC is responsible for regulating claims about food that appear in advertising and certain other forms of labeling that may also constitute advertising. FSIS and FTC, in practice, generally coordinate their activities to avoid duplication. FSIS takes the lead in addressing the labeling of meat and poultry products. Advertising of meat and poultry products is within the purview of the FTC. It is prudent to consult FSIS labeling regulations, rules and policies when developing advertising for meat and poultry products. - 12 -,"B. Role of the States -- Validity of State and Local Regulations that Affect the Food Label State requirements adopted under state law may not differ from, or conflict with, existing federal labeling laws and regulations. States are, therefore, prohibited from imposing requirements different from or in addition to federal labeling requirements. When state law directly conflicts with federal law, or attempts to regulate in an area Congress intended to be regulated solely by federal law, the state law is generally preempted, or superseded, by federal law. This is known as the federal preemption doctrine. 43 The FMIA and the PPIA explicitly preempt state laws regulating labeling of meat and poultry products by providing that marking, labeling, packaging, or ingredient requirements in addition to, or different than, those made under this Act may not be imposed by any State. 44 The federal preemption established by the FMIA and PPIA was upheld by the United States Supreme Court in a case involving California net weight labeling requirements. 45 The Court held that the California law was different from the USDA net weight standard which permitted manufacturing deviations and allowances for variations caused by moisture loss. The California law was thus declared preempted by federal law, and therefore, unenforceable. Federal courts have repeatedly and consistently upheld federal preemption of FSIS labeling requirements in the face of differing state labeling rules or practices. 46 A federal district court has ruled more recently that food packages that meet federal net weight labeling requirements may not be subjected to - 13 -,"sanction by state or local weights and measures officials based on the findings of limited retail inspections. In *Kraft Foods North America v. Rockland County Department of Weights and Measures*, the court held that reliance on limited retail inspection data gathered from small retail lot inspections to support a short weight violation conflicts with federal recognition of the reasonable variation that inevitably arises over the course of a production run. As previously stated, all labels on meat and poultry products destined for commerce must be in accordance with all applicable federal rules and approved by FSIS. Therefore, if a manufacturer's product is accurately labeled under federal rules when packaged, product remains accurately labeled,

regardless of where a portion of a given production lot is ultimately offered for sale. 47 III. FSIS LABELING \u2013 SURVEY OF BASIC PRINCIPLES A. When Packaging Must Bear Required Labeling FSIS labeling authority is very broad, extending from the labels appearing on the food package, before they are applied to the product, to point-of-purchase materials, including promotional brochures and shelf-talkers. 48 As mentioned previously, a \u201clabel\u201d is a display of any printing, graphics stickers, seals or other written, printed or graphic matter upon the immediate container. 49 This regulatory authority over the food label can affect the processing and manufacturing operations of food companies. Meat and poultry products that do not bear the USDA-approved label, unless expressly exempt, may not be distributed in interstate commerce. - 14 -,"The manner in which a meat or poultry product is packaged when shipped from an inspected establishment determines what information should appear on the label of the packaged product. The rules vary depending upon whether the product is a processed or prepared meat or poultry product, or an unprocessed meat cut, or a poultry product, and upon the type of package or container in which the product is packed and shipped. Immediate containers (e.g., bags, cardboard cartons, tray packs, and film bags enclosing processed or prepared meat products) can be considered \u201cprotective coverings\u201d and exempt from marking and labeling requirements if placed within a shipping container that meets all mandatory labeling requirements (product name, handling statement, legend, establishment number, net weight, ingredients statement, signature line, nutrition facts, and safe handling instructions when required). 50 This exemption does not include the mandatory identification and marking required for the inner container of the meat food product. The shipping container that contains exempt immediate containers must be marked \u201cPacked for Institutional Use Only\u201d or with an equivalent statement of intended limited distribution from one federal establishment to another. The unlabeled product within the shipping container may not be removed for further distribution nor displayed or offered for sale at retail. For unprocessed meat cuts, transparent film bags enclosing individual meat cuts in an unprocessed state can be considered \u201cprotective coverings\u201d and exempt from the mandatory labeling requirements when - 15 -,"required information appears on the shipping container in which the immediate containers are placed. Unlike processed meats, unprocessed meats when shipped may be removed from the shipping container for resale and further distribution to retailers, hotels, restaurants, and similar institutions if the product itself or the film bag bears a legible official mark of inspection and the establishment number. Poultry whole birds or individual cuts in protective coverings for export or sold to hotels, restaurants, or institutions only are exempt from the mandatory labeling of immediate containers, and no marking or labeling is permitted except in limited situations. The shipping container is considered the immediate container and should, therefore, include all mandatory features (product name, handling statement, legend, poultry plant number, net weight statement, ingredients statement, signature line, nutrition facts, and safe handling instructions when required.) A statement of limited use is not required to appear on the shipping container. Beyond these general requirements are specific provisions for certain types of products. 51 B. The Prior Label Approval Process Prior approval of all food labels affixed to a meat or poultry product must be consistent with FSIS regulations. The evolution of the prior label approval process provides useful context for understanding the current requirements. For many years, each label affixed to a meat or poultry product had to be submitted to FSIS for

evaluation and approval. Any modifications to - 16 -,"the approved label required resubmission to FSIS for a new final approval. Only in certain instances could minor modifications be approved at the inspected establishment by the FSIS inspector. Over time, the number of label submissions for final approval grew substantially as the number of new and modified products increased. The current regulations reflect the Agency\u2019s decision to modify its prior label approval authority in a fashion that has dramatically reduced the number of labels that must actually be submitted for evaluation and approval by FSIS staff. The local inspector no longer plays a role in the preapproval process but has the authority to retain product that bears non-compliant labels. Under the current regulations, final approval has been replaced with sketch approval based on submission of a label application to FSIS. 52 A sketch-approved label can be modified unilaterally by the company consistent with the flexibility specified by regulation, discussed below. In addition, specified types of product labels can be applied to meat and poultry products according to the generic labeling regulations without the need for submittal to FSIS, as long as the labels are in conformance with all applicable statutory, regulatory, and policy requirements. [To enhance the efficiency of its prior- approval process, FSIS encourages establishments to make use of the generically-approved labeling provisions. Establishments should consult with FSIS staff to resolve any uncertainty in this regard.] - 17 - ", "1. Treatment of Retail Labels Generally, no claims may appear on retail labels unless prior approval is obtained. Although FSIS labeling policies apply at retail, FSIS does not require that point-of-purchase material receive prior approval unless it is shipped with the product (e.g., stickered-labels applied by the retailer placed in the shipping container at the establishment where product is packed.) FSIS will evaluate and seek necessary correction of such material brought to its attention or identified by routine marketplace surveillance. 53 Despite the absence of required preapproval, meat and poultry labels applied at retail must conform to all applicable FSIS labeling regulations. A notable exception arises for so-called animal production claims (e.g., \u201craised without antibiotics\u201d) whereby only claims that have been approved by FSIS through submission of a label application may appear on \u201cretail labels.\u201d The labels applied at retail are not required to have sketch approval, but the animal production claims must be preapproved by the Agency (i.e., via the label affixed to the shipping carton). A prerequisite for FSIS approval is an establishment\u2019s written protocol that sets forth the parameters of the program to ensure the accuracy of the claim. Sometimes referred to as an \u201caffidavit\u201d or \u201ctestimonial\u201d program, appropriate documentation validating adherence to the FSIS-accepted protocol must be submitted to the Agency. 54 2. Establishment Responsibilities An establishment operates under a grant of inspection and bears certain responsibilities as a part of the label approval process. The processing - 18 -,"facility must create records of all final labeling, including sketch labels that have been approved. 55 Establishment records are to reflect modifications made to a sketch approval to the label prior to printing of the final labels. Records that must be maintained include all final labeling and \u201ctemporary\u201d label approvals. The prior-approval process does not excuse an establishment from ensuring that its labeling fully complies with applicable FSIS labeling requirements. It is prudent for an establishment to contact FSIS staff directly when proposed product formulations or label claims raise policy issues or an establishment is unsure how to apply the labeling requirements. Only labeling that is approved or expressly permitted may appear on product destined for interstate commerce. One cannot

otherwise unilaterally modify labels unless a specific regulation allows for such change or addition (e.g., random weight packages.)

3. \u201cTemporary\u201d Label Approvals FSIS recognizes that in certain circumstances a manufacturer has labels that contain one or more minor errors. On a case-by-case basis, FSIS will allow for temporary use of a nonconforming label if the criteria set forth by regulation are met. Use of a label that is in error renders a product misbranded unless temporary approval is granted by FSIS for the particular label.

Temporary labels may be granted under the following conditions: (i) The proposed labeling would not misrepresent the product; - 19 -,"(ii) The use of the labeling would not present any potential health, safety, or dietary problems to the consumer; (iii) Denial of the request would create undue economic hardship; and (iv) An unfair competitive advantage would not result from the granting of the temporary approval. An application requesting temporary approval must address each of these considerations.<sup>56</sup> Temporary approvals may be granted for a period not to exceed 180 calendar days. FSIS may also grant extensions of temporary approvals if the applicant demonstrates that new circumstances, meeting the above criteria, have developed since the original temporary approval was granted.

57 4. Labels Approved Under the Generic Labeling Regulations FSIS allows generically approved labels to be applied to meat and poultry products in the exercise of its broad prior label approval authority. By regulation, FSIS specifies when generic approval can be undertaken by an establishment, foregoing the need to obtain a sketch approval requiring a submission of a label application directly to FSIS.

<sup>58</sup> Products for which a standard of identity applies may be generically approved, provided that the labeling does not contain any special claims, including quality claims, nutrient content or health claims, negative claims, geographical origin claims, or guarantees. For labeling that is not for domestic product (i.e., marked \u201cfor export only\u201d), the addition or deletion of the direct translation of a foreign language may be generically approved. - 20 -,"The final rule specifies numerous other types of labeling that are generically approved and, thus, need not be submitted to FSIS for sketch approval: single-ingredient products that bear no claims; products sold under contract specifications to the Federal government; labeling of shipping containers that contain fully- and properly-labeled immediate (inner) containers; food not intended for human consumption; meat inspection legends; inserts, tags, and other materials that bear no reference to the product and are not misleading; and the labeling for consumer test products not intended for sale.

5. Modifications of Labels Made Under the Generic Labeling Regulations FSIS also specifies the changes that can be made to a sketch- approved label whereby the modified label is not resubmitted for a new \u201csketch\u201d approval.

<sup>59</sup> Any change not authorized by regulation triggers the need for submission of the revised label for sketch approval. Consultation with FSIS staff is prudent to ensure that, in a given circumstance, the flexibility afforded these requirements is fully realized. All such modifications should be documented by the establishment, similar to generic label-approval recordkeeping discussed above. Permitted modifications or changes extend to the following features of a sketch- approved label: (1) proportionately enlarged or reduced labels; (2) substitution of any unit of measurement with its abbreviation, or vice versa; (3) a master or stock label from which the name and address of the distributor are omitted but to be applied before being used; (4) wrappers or other covers - 21 -,"bearing pictorial designs or illustrations; (5) change in the language or arrangement of opening or serving directions; (6) addition, deletion or amendment of on-pack coupons, cooking instructions, packer product code information or UPC information;

(7) any change in the manufacturer's identification and address; (8) net weight statement; (9) recipe suggestions; (10) change in punctuation; (11) newly-assigned or revised establishment number; (12) open date information; (13) change in packing material; (14) brand name changes, provided there are no design changes and the name does not connote quality or other characteristics of the product; (15) deletion of the word "new"; (16) special handling statements; (17) safe handling instructions; (18) the amount of an ingredient that does not change the order in which the ingredients are declared; (19) color; (20) vignettes, provided they do not render the product labeling misleading; (21) company-initiated change in establishment number; (22) nutrition values, except that the serving size cannot be modified; (23) deletion of any claim or nonmandatory features of the label; and (24) addition or deletion of a direct translation of the English language into a foreign language for products marked "export only."

C. Regulatory References \u2013 Resource Tools

FSIS labeling requirements and policies are found in the relevant statutes, implementing regulations, FSIS directives (including Policy Memoranda), FSIS notices, and the Food Standards and Labeling Policy Book. FSIS directives and FSIS notices are the two primary types of issuances that instruct FSIS inspection workforce and technical employees on how to carry - 22 -,"out their responsibilities. FSIS directives contain instructions of an indefinite duration, while notices are temporary instructions scheduled to expire no later than one year from the issuance date. The Food Standards and Labeling Policy Book is a compilation of policy and informal standards that have been established over years of labeling decisions assembled in a dictionary format. All of these useful references are found at the FSIS website ([www.fsis.usda.gov](http://www.fsis.usda.gov)). As part of its prior-approval process, FSIS routinely reviews policy issues on an ongoing basis. Therefore, it is important to consult these resources which are updated periodically. New policy questions should be directed to the appropriate FSIS staff.

**IV. MANDATORY REQUIREMENTS --**

**INTRODUCTION** There are up to eight specific requirements for each product label: (1) product name, (2) inspection legend and establishment number, (3) handling statement, (4) net weight statement, (5) ingredients statement, (6) address line, (7) nutrition facts, and (8) safe handling instructions. Each of these requirements is discussed in detail below. The information must or may appear on specified areas of the label. In designing a label, it is important to understand what information must go where. The placement and prominence of information of the mandatory requirements are specified by regulation. Generally, any required label information must be prominent, conspicuous (as compared to other words, statements, and designs on the label), and in such terms as "to render it likely to be read and understood by the ordinary individual under customary - 23 -,"conditions of purchase and use."

To ensure that this threshold requirement is met, the regulations specify where and in what fashion certain required information must appear. These provisions vary depending on the particular required label statements, and are specified in the appropriate sections below.

**A. Principal Display Panel** [9 C.F.R. \u00a7 317.2(d) (meat); 9 C.F.R. \u00a7 381.116(b) (poultry)] The principal display panel, or "PDP," is the part of the label most likely to be displayed, presented, shown, or examined under customary conditions to the consumer.

When a label bears alternate PDPs, information required to appear on the PDP shall be duplicated on each PDP. The PDP must include the name of the product, net quantity of contents, the official inspection legend, number of the official establishment, and, if necessary, a handling statement. The PDP must be large enough to accommodate mandatory labeling information required by statute or

regulation. 62 In determining the area of the PDP, the tops, bottoms, flanges at the top or bottoms of cans, and shoulders and necks of bottles and jars are excluded. The PDP is specifically defined as follows. \u2022 For rectangular packages, one entire side, the area of which is at least the product of height times the width of that side. \u2022 For a cylindrical or nearly cylindrical container, the area that is 40 percent of the product at the height of the container times the circumference of the container or a panel, the width of which is one-third of the circumference and the height of which is as high as the container. - 24 -,"\u2022 For a container with any other shape, 40 percent of the total surface area is considered the PDP. Certain other special circumstances for placement of the PDP are specified as well. B. Information Panel [9 C.F.R. \u00a7 317.2(m) (meat); 9 C.F.R. \u00a7 381.116(c) (poultry)] The information panel typically is that part of the label immediately contiguous and to the right of the PDP. The information panel also can be the back panel or, for some boxes, any panel contiguous to the PDP. All information required to appear on the label of a package must appear either on the PDP or the information panel unless otherwise specified by regulation. 63 Certain other label information that may be placed on the information panel (unless on the PDP) includes: an ingredients statement, name and address of the manufacturer or distributor, and nutrition labeling, if required. The safe handling instructions may be placed anywhere on the label. As with the PDP, information appearing on the information panel must be prominent and conspicuous. 64 Certain exemptions are permitted by regulation where the label is below a certain size due to the overall size of the food product\u2019s package. 65 An establishment may not deviate from regulatory requirements in an effort to accommodate optional information (e.g., product name not prominent to allow for large \u201cnew and improved\u201d claim.) - 25 -,"V. PRODUCT NAME [9 C.F.R. \u00a7 317.2(c) (meat); 9 C.F.R. \u00a7 381.117 (poultry)] A. Overview 1. Determining a Product\u2019s Name All meat and poultry products must be identified by a product name on the PDP. The regulations state that the product must be identified by the name specified by the standard, if there is one, or a common and usual name, or a truthful descriptive designation of the product. The regulations are intended to ensure that the product name accurately informs a consumer of a product\u2019s identity. In addition, there are detailed requirements in the regulations and labeling policies to ensure that the product identity is clear and prominent to the consumer. In brief, if the product is represented as a product for which a standard of identity is established, the product must be identified by that name on the labeling, (e.g., \u201cChili con Carne\u201d or \u201cChicken Soup\u201d.) If no standard of identity is established for a product, one must next consider if the product is identified by a common or usual name, if one exists (e.g., \u201cBeef Shoulder Clod\u201d or \u201cPork Loin\u201d.) Such a name may be established by regulation or common usage, and it must describe the basic nature of the product or its characterizing ingredients. In the absence of either a standard of identity or appropriate common or usual name, the identity statement must be a descriptive name. The descriptive name should accurately identify or describe - 26 -,"the basic nature of the food or its characterizing properties or ingredients (e.g., \u201cBeef and Vegetables in Dough\u201d or \u201cBreaded Nugget-shaped Chicken Patty\u201d.) 2. Placement and Prominence of Product Name The product name must appear prominently on the principal display panel. Certain regulations and Policy Memoranda specify the size (or relative size) of terms that appear as part of the product name. In general, words in product names or fanciful names may be of a

different size, color, or type, but in all cases the words must be prominent, conspicuous, and legible. 66 No word in a product name (standardized name, a common or usual name, or descriptive name) should be printed in letters that are less than one- third the size of the largest letter used in any other word of the product name. This same requirement is applicable to fanciful names as well. For example, for a product labeled Chili Mac\u2014Beans, Macaroni and Beef in Sauce, \u201cChili Mac\u201d is the fanciful name, and \u201cBeans, Macaroni, and Beef in Sauce\u201d is the product name. No letter in \u201cChili Mac\u201d may be smaller than one-third the size of the largest letter in \u201cChili Mac.\u201d Furthermore, no letter in the true product name, (i.e., \u201cBeans, Macaroni, and Beef Sauce,\u201d) may be smaller than one-third of the largest letter in the true product name. Product names in certain instances must be accompanied by a qualifying statement deemed necessary to ensure that the product name is not misleading. For example, for a turkey-ham product, \u201cturkey\u201d must appear in the same size, style, and color and on the same background as the word \u201cham.\u201d The product name must be qualified with the statement \u201ccured turkey thigh - 27 -,"meat.\u201d The qualifying statement must be contiguous to the product name (when triggered), without intervening type or designs, not less than one-half the size of the product name but not less than one-eighth inch in height, and shall be in the same style and color and the same background as the product name and in the same size, style and color, and same background as the word \u201cham.\u201d 67 B. Standards of Identity [9 C.F.R. Part 319 (meat); 9 C.F.R. \u00a7 381 Subpart P (poultry)] USDA has statutory authority to establish standards of identity for meat and poultry products. Under the FMIA and the PPIA, a product is \u201cmisbranded\u201d if: It purports to be or is represented as a food for which a definition and standard of identity or composition has been prescribed by regulations . . . unless (A) it conforms to such definition and standard, and (B) its label bears the name of the food specified in the definition and standard. 68 A standard of identity prescribes a manner of preparation and the ingredients of a product that is to be labeled with a particular name. Numerous product standards have been established by regulation. 69 FSIS also has established informal policy standards by Policy Memoranda and through entries in its Food Standards and Labeling Policy Book. Foods subject to a standard of identity must be labeled with the name specified in the standard. A food that bears the name of a standardized food that does not satisfy the requirements of the applicable standard is misbranded. Examples of standardized products - 28 -,"include: \u201cHam,\u201d \u201cHam Water Added,\u201d \u201cHot Dogs,\u201d \u201cChicken and Noodles,\u201d and \u201cSpaghetti Sauce with Meatballs.\u201d C. Common or Usual Name [9 C.F.R. \u00a7 319.1 (meat); 9 C.F.R. \u00a7 381.117 (poultry)] The FMIA and PPIA authorize FSIS to promulgate common or usual names for meat and poultry food products. A product is misbranded unless it bears \u201cthe common or usual name of the food, if any there be.\u201d 70 FSIS regulations state further that any product \u201cfor which there is a common or usual name must consist of ingredients and be prepared by the use of procedures common or usual to such products, insofar as specific ingredients or procedures are not (otherwise) prescribed or prohibited.\u201d Examples of common or usual names include red meat primals, (e.g., beef round,) and subprimals, (e.g., beef sirloin steak.) D. Descriptive Names [9 C.F.R. \u00a7 317.2(e) (meat); 9 C.F.R. \u00a7 381.117(a) (poultry)] Descriptive terms may be used as a product\u2019s statement of identity provided that no standard of identity or common or usual name exists. For meat products, \u201cany descriptive designation used as a

product name for a product which has no common or usual name shall clearly and completely identify the product.\u201d For poultry products, FSIS requires \u201ca truthful descriptive designation\u201d absent a standard of identity or common or usual name. Product which has been prepared by a specific method, such as salting, smoking, drying, or chopping, must be so described unless the name implies, - 29 -,"or the manner of the packaging shows, that the product is subject to the particular form of processing. Examples of descriptive names include \u201cChicken and Vegetable in Dough\u201d or \u201cBreaded Nugget-shaped Chicken Patty.\u201d Unqualified meat terms common to the industry but uncommon to consumers, such as \u201cpicnic,\u201d \u201cbutt,\u201d and \u201cloaf\u201d must not be used as product names unless accompanied by terms descriptive of the product or with a list of ingredients, if the Agency determines that this is necessary to ensure that the label is not false or misleading. This labeling convention is only true for certain (non-specific) meat products. In contrast, the poultry regulations provide that \u201ckind\u201d (poultry species) be specified in the product name. Manufacturers may also make use of a fanciful name accompanied by a descriptive term or name that is designed to ensure that consumers are not misled as to the identity, amount, or composition of a product. A product with the fanciful name \u201cFiesta Mexicana\u201d, along with the descriptive term \u201cChicken Breasts with Salsa and Peppers\u201d, is such an example. Use of fanciful names is especially common for a whole array of new or newly-formulated food products. A truly fanciful name will not convey a meaning that in any way relates to the nature of the product (e.g., Moon Pie.) E. Imitation Food Products [9 C.F.R. \u00a7 317.2(j)(1) (meat); 9 C.F.R. \u00a7 381.1(b) (poultry)] A label for a product that is an imitation of another food shall bear the term \u201cimitation\u201d immediately preceding the name of the food imitated and in the same size and style of lettering as the product\u2019s name. An ingredients - 30 -,"statement must follow the imitation product name. USDA has informally followed FDA\u2019s approach with regard to imitation labeling and products not being nutritionally inferior. Products that resemble but are not nutritionally inferior to standardized meat or poultry products need not bear the \u201cimitation\u201d designation, provided that the meat or poultry content is conspicuously disclosed. 71 If a product is nutritionally inferior to the standardized product, it must be labeled \u201cimitation\u201d as part of the product name. 72 FSIS regulatory policy permits the marketing of products that are technically imitation solely because they do not adhere to the compositional requirements established for a standardized product or other traditional food with generally recognized, established contents (e.g., Ground Beef and Textured Vegetable Protein (TVP) Product.) This policy enables a food manufacturer to make a product that is nutritionally inferior and is designed to serve consumer preferences without the use of the stigmatizing term \u201cimitation.\u201d In response to consumer preference for lower fat alternatives to standardized foods, FSIS allows products to be nutritionally modified to reduce the fat, cholesterol, or sodium content through the addition of ingredients for fat or sodium replacement precluded or restricted by applicable standards. 73 Pursuant to this policy, qualifying products may bear the standardized name in conjunction with an appropriate nutrient content claim provided that consumers are informed of the actual components through labeling and certain other guidelines are followed. For example, meat products that combine fresh sausage, ground beef, or hamburger and other safe and suitable ingredients for - 31 -,"the principal purpose of replacing fat may be descriptively labeled. Such products are

\u201cLean Ground Beef, Water, and Carrageenan Product,\u201d \u201cLow Fat Ground Beef With X% Solution of \u2026,\u201d \u201cLean Beef Sausage, Water, and Carrageenan Product,\u201d or \u201cReduced Fat Pork Sausage, Water, and Binders Product,\u201d provided, in part, that the regulatory requirements for the nutrient content claims are satisfied. 74 Breakfast sausages, cooked sausages, and fermented sausages with modified fat content also may be identified by a nutrient content claim and a standardized or traditional name, such as \u201cLow Fat Pepperoni\u201d or \u201cReduced Fat Frankfurter.\u201d 75 F. Geographic Origin [9 C.F.R. \u00a7 317.8(b)(1) (meat); 9 C.F.R. \u00a7 381.129(b)(2) (poultry)] By regulation, terms having geographic significance generally may appear without qualification on the labeling of meat only when the product is made in the geographic area mentioned. Terms of geographic significance referring to a locality other than where the product was made may appear on the label of meat products only if qualified by the words \u201cStyle,\u201d \u201cType,\u201d or \u201cBrand,\u201d accompanied by a \u201cMade In \u2026\u201d phrase that properly identifies where the product is manufactured. The provisions governing poultry products are somewhat different and are separately described below. Significant geographic areas that are qualified by the terms \u201cstyle\u201d and \u201ctype\u201d may appear on the labels of meat products when there is a generally recognized style or type of product produced in that particular geographic area. FSIS permits use of geographic terms when accompanied by the qualifying - 32 -,"term if the manufacturer can demonstrate that there is a recognized \u201cstyle\u201d or \u201ctype.\u201d 76 Therefore, a chili produced in California can be labeled \u201cCalifornia Chili con Carne,\u201d or since it is made in the southwestern United States, it could be labeled \u201cSouthwestern Chili con Carne.\u201d On the other hand, a chili made in Nebraska could be labeled \u201cNebraska\u201d or \u201cNebraska Style Chili con Carne,\u201d or since there is a recognized southwestern style, it could be labeled \u201cSouthwestern Style Chili con Carne,\u201d if it meets the style. \u201cBrand\u201d is used as part of a product name or claim when a style or a type is not recognized or met. A qualifying statement identifying the place where the product is actually made must appear in proximity to \u201cbrand\u201d when such qualifying term is required. Therefore, using the example of chili made in Nebraska above, if the products did not comply with the definition for \u201cSouthwestern Style,\u201d the product must be labeled \u201cSouthwestern Brand Chili con Carne, Made in Nebraska.\u201d The word \u201cBrand\u201d must be the same size and style of lettering as the geographic term, and it must be accompanied with a prominent qualifying statement identifying the particular locality in which the product is prepared. 77 Where a geographic term has come into general usage as a trade name and has been approved by FSIS as not being geographically significant and, thus, generic, the term may be used without qualification, such as \u201cOld El Paso.\u201d 78 The regulation specifically states that the terms \u201cVienna,\u201d \u201cGenoa,\u201d \u201cPolish,\u201d \u201cItalian,\u201d and other similar terms need not be accompanied with a qualifying descriptive term when used on the standardized product. In - 33 -,"addition, some trade names have been used so long and exclusively by a manufacturer so that it is generally understood by consumers to mean the product of a particular manufacturer, such as \u201cSwiss Chalet.\u201d 79 In contrast to the meat regulations, FSIS poultry regulations specify that a geographic term only may be used to identify a poultry product if the product was actually produced in the locality stated on the label. 80 However, as a matter of policy, FSIS

has modified its treatment of geographic terms for poultry products to parallel the policy applied to meat products. The underlying issue with respect to geographic origin is whether a product name truly connotes geographic significance to consumers or merely implies a product's style and the importance this information is to consumers. A truthful representation of geographic origin is permitted, such as "Virginia Ham" that is produced in the Commonwealth of Virginia, or "Tennessee Peppersteak," made in Tennessee. When the term "Style" is used, there must be a method of preparation or other product attributes that distinguish or characterize the product in a manner similar to products peculiar to a geographic region. An establishment must demonstrate that such a style exists in order to use the geographic claim. By informal policy, FSIS has allowed establishments to rely upon an independent third-party authority (e.g., culinary institute) to establish that a particular style is associated with a specific geographic area and that the particular product(s) bearing the claim comport with this recognized style. - 34 -,"G. Country of Origin [9 C.F.R. § 327.14-.15] FSIS requires imported meat and poultry products to bear the name of the country of origin, preceded by the words "Product of." On an immediate container, this country of origin statement must be immediately under the name of the product. 82 On an outside container, this statement accompanies the product name and establishment number in a prominent, legible manner. 83 VI. USDA INSPECTION LEGEND [9 C.F.R. § 312 (meat); 9 C.F.R. § 381.96 (poultry)] USDA regulations require a prominently displayed inspection legend and establishment or plant number on the principal display panel of all federally-inspected meat or poultry product containers unless there is a specific exception (e.g., on a metal clip.) 84 An official inspection legend is any symbol prescribed by regulations showing that a carcass or parts of carcasses were inspected and passed by FSIS in an official establishment in accordance with all federal regulations. An official establishment number is assigned to each establishment granted inspection service. The establishment number is used to identify all containers of inspected products prepared in the establishment. A product will be deemed "misbranded" if it fails to bear these features on its containers. 85 The regulations prescribe requirements for the relative dimensions and placement of the inspection legend; and this inspection legend must be of - 35 -,"a sufficient size and of such color as to be conspicuously displayed and readily legible. 86 The use of a foreign language for all aspects of a label is acceptable provided the inspection legend and establishment or plant numbers also appear in English.87 The products themselves are not required to be branded when shipped in properly-labeled containers or when shipped under an official government seal. There are regulations that specify in great detail the precise manner, method and location by which the legend must be placed on the label of an inspected product. The required official inspection legend for inspected and passed poultry products should include the following wording, "Inspected for wholesomeness by U.S. Department of Agriculture." 88 The establishment number is prefaced by a "P" designating that the product is a poultry product. This wording should be contained within a circle. The form and arrangement should be exactly as indicated in 9 C.F.R. 381.96. The appropriate official plant number (P-and the federal number) should be shown, but, if the number appears elsewhere on the labeling material, it may be omitted from the inspection mark.89 If the number appears off the exterior of the container (e.g., on a metal clip,) a statement of its location must be printed contiguous to the legend (e.g., "Est. No. on

metal clip\ufe0f.) Products consisting of mixed meat and poultry ingredients must contain either the official meat inspection legend or official poultry inspection legend, depending on which ingredients are present in greater amounts. If meat or poultry ingredients exist in equal proportions, either official legend - 36 -,"may be used. If meat and poultry ingredients exist in exact proportions and both appear in the product name, the official legend must reflect the ingredient appearing first in the product name. VII. NET QUANTITY [9 C.F.R. \u00a7 317.2(h) (meat); 9 C.F.R. \u00a7 381.121 (poultry)] USDA statutes and regulations establish specific labeling requirements governing statements of the net quantity of the food package offered for sale to the consumer in a retail setting. This information facilitates value comparisons among similar products by consumers. All labels on food sold at retail must bear an accurate statement of the quantity of the package content in terms of weight, measure, or numerical count. 90 Such a statement must appear on the principal display panel of all containers to be sold at retail intact. 91 The statement must be in terms of the package contents -- solid, liquid, semi-solid, or viscous. 92 Reasonable quantity variations from the stated weight, caused by loss or gain of moisture during the course of good distribution practices or by unavoidable deviation in good manufacturing practices, are recognized and do not render a product to be misbranded. 93 Reasonable variations are permitted because of the nature of certain foods and the impossibility of developing completely accurate means of packaging. 94 Such variation may not be unreasonably large. 95 The Supreme Court held that the federal net weight requirements preempt state law requirements that do not permit reasonable variations, including unavoidable variations caused by moisture - 37 -,"loss during the course of good distribution practice. 96 Federal courts on several occasions have ruled that state or local enforcement practices in conflict with the FMIA or PPIA are preempted. 97 A. Expression of Net Quantity Statement The statement of quantity shall be expressed in terms of avoirdupois weight or liquid measure. The use of metric measurement as it relates to the net weight statement is voluntary because the FPLA exempts meat and poultry products from metric declaration. Where there is no general consumer usage to the contrary, the net quantity of contents statement for products sold in the U.S. should be expressed in terms of liquid measure if the product is liquid, or in terms of weight if the product is solid, semisolid, viscous, or a mixture of solid and liquid. 98 For example, a chili product would be measured in ounces and pounds, while a beef broth would be measured in fluid ounces. Thus, FSIS regulations require the terms \u201cnet weight\u201d or \u201cnet wt.\u201d to appear with the net quantity of contents when expressed in terms of weight and \u201cnet contents\u201d or \u201ccontent\u201d when expressed in terms of fluid measure. 99 Packages containing at least one pound or pint, but not more than 4 pounds or 1 gallon, must be expressed as a \u201cdual declaration.\u201d 100 A dual declaration includes ounces or fluid ounces followed, in parenthesis, by the largest whole U.S. customary unit (e.g., pounds and pints or quarts and gallons.) Any remainder should be expressed in terms of ounces or common or decimal fractions of the pound for weight measure, and fluid ounces or common or decimal fractions of the pint or quart for fluid measure (e.g., \u201cNet Wt. 24 oz. (1 - 38 -,"lb. 8 oz.),\u201d \u201cNet Wt. 24 oz. (1.5 lbs.),\u201d or \u201cNet Wt. 24 oz. (1 \u00bd lb.).\u201d 101 Exceptions for random weight, small, and multi-unit packages, as well as certain packages containing margarine and bacon, are discussed below. 102 B. Placement The net quantity of contents statement must appear in the lower 30 percent of the principal display panel of containers sold at retail intact in the following

manner.103 In lines generally parallel to the base of the containers. 104 In distinct contrast with other material on the package. 105 Separated from other printed label information appearing above and below it by a space at least equal to the height of the lettering used in the statement. 106 Separated from information appearing to its right and left by a space at least equal to twice the width of the letter 'N' of the style or type of lettering used in the declaration. 107 Packages that have a principal display panel of five square inches or less do not have to place the net quantity statement in the lower 30 percent of the principal display panel, provided that the declaration meets all other USDA requirements.

108 C. Prominence Additionally, USDA prescribes specific type requirements for the net quantity statement. The declaration must be in conspicuous and easily legible boldface print or type. 109 The lettering may be no more than three times as high as it is wide. 110 - 39 -," The minimum type size for the statement is dependent on the area of the PDP, as described in the table below. 111 When both upper and lower case letters are used in the declaration, the height of the lower case or its equivalent must meet the minimum type size requirements. 112 When only upper case letters are used, the height of the upper case letters must meet the minimum type size criteria. 113 When fractions are used, each numeral of the fraction must meet onehalf the minimum height standards. 114 Area of the PDP In Square Inches Minimum Type Size In Inches < 5 1/16 > 5-25 1/8 > 25-100 3/16 >100-400 1/4 > 400 1/2 D. Exceptions and Other Special Requirements USDA permits the following exceptions from its requirements for the net quantity statement. Individually-Wrapped, Random-Weight, Consumer-Size Packages Shipped in Bulk Containers; and Certain Meat and Poultry Products Subject to Shrinkage Through Moisture Loss The above-referenced products are not required to bear a net weight statement when shipped from an official establishment, provided that the shipping container bears a net weight shipping statement that expresses accurately the net quantity of contents in the container and is not - 40 -," otherwise false or misleading. The individual, random-weight, consumer-size packages must bear a net weight statement prior to retail display and sale. The declarations on the shipping container and individual packages are exempt from the type size, dual declaration, and placement requirements described above, if an accurate net weight declaration is shown conspicuously on the principal display panel of the shipping container or package. 115 Small Packages in Shipping Containers -- Individually-wrapped and labeled packages of less than 1 ounce net weight and random weight consumer size packages are exempt from USDA's net quantity of contents labeling requirements, provided that the packages are in a shipping container that expresses accurately the net quantity of contents in the container and is not otherwise false or misleading. 116 Small Packages in General -- Individually-wrapped and labeled packages of less than 1 ounce net weight with labels declaring net weight, price per pound, and total price are exempt from the type size, dual declaration and placement requirements described above if an accurate statement of net weight is shown conspicuously on the principal display panel of the package. 117 Sliced, Shingle-Packed Bacon in Rectangular Packages; and Margarine in One Pound Rectangular Packages (except packages containing whipped or soft margarine or packages containing more than four sticks) Provided that an appropriate net quantity statement appears on the principal display panel of the above-referenced products in a conspicuous

manner,\u201d the statement is exempt from the dual declaration requirement and the requirement that the net quantity of contents declaration appear in the bottom 30 percent of the PDP. 118 \u2022 Certain Types of Consumer Packages of Poultry Products \u2013 The Administrator may approve the use of labels that do not bear a net weight statement on the above-referenced packages, provided that: (1) the shipping container bears the statement, \u201cNet weight to be marked on consumer packages prior to display and sale\u201d; (2) the total net weight of the contents of the shipping container is marked on the container; (3) the shipping container also bears the statement: \u201cTare weight of consumer package\u201d in \u201cclose proximity\u201d to the tare weight of the consumer packaging, weighed to the nearest 1\8 ounce or less. 119 - 41 -,"Special net weight labeling rules are specified for multiunit retail packages (MRPs). An MRP is defined as a package containing two or more individually-packaged units that: (1) contain the identical commodity; (2) contain the same quantity of food; and (3) are intended to be sold as part of the MRP but are capable of being individually sold in full compliance with USDA regulations. 120 A net quantity statement is required on the outside label of the MRP. The statement must comply with the same requirements applicable to net quantity statements generally, as discussed above. In addition, net quantity statements for MRPs must also include the following: 121 \u2022 The number of individual units; \u2022 The quantity of each individual unit; and \u2022 In parenthesis, the total quantity of contents of the multiunit package, except that the declaration of total quantity need not be expressed as a \u201cdual declaration\u201d (e.g., the declaration in ounces need not be followed by an additional parenthetical declaration in terms of the largest whole U.S. customary units.) Examples of products that might bear this type of information could include pizza or soups. VIII. INGREDIENTS LABELING [9 C.F.R. \u00a7 317.2 (meat); 9 C.F.R. \u00a7 381.118 (poultry)] The ingredients statement provides the consumer with detailed information as to the constituents of a meat or poultry product. The number of ingredients, the multiple functions of ingredients, and the sophisticated methods for producing some ingredients create many challenges in applying the ingredient labeling requirements. Proper ingredients labeling requires - 42 -,"regulatory and technical expertise. An understanding as to the function an ingredient plays in the food is central to proper application of the ingredient labeling requirements. A. Overview: Basic Requirements An ingredients statement is required when a product is fabricated from two or more ingredients. 122 All ingredients must be declared by their common or usual names on the label in descending order of predominance by weight.123 Order of predominance is determined based on the weight of ingredients as added to the formulation. 124 An ingredients statement is not required when the product name provides a complete identification of all ingredients in the food (e.g., \u201cChicken Breasts with Rosemary Extract\u201d.) Ingredients present in individual amounts of two percent or less may be listed in other than descending order, provided that they are listed at the end of the ingredients statement preceded by a phrase such as \u201cless than \_\_ percent of \_\_,\u201d with the blank filled in with the \u201cappropriate\u201d threshold level of two percent, 1.5 percent, one percent, or 0.5 percent. 125 These quantifying statements should start with the threshold level of 2.0% and move down in 0.5% increments, (i.e., 1.5%, 1.0%, or 0.5%) No ingredient in the quantifying statement may be greater than the stated threshold, and ingredients listed in the quantifying statement may be adjusted in the formulation without a change in the ingredients statement. When two meat ingredients comprise at least 70% of the

meat and meat by-product ingredients of a formula, and when neither ingredient is less than 30% by weight of the total meat and meat by-products used, these meat ingredients may be interchanged in the formula without a change to the ingredients statement.<sup>126</sup> In such cases, the word '\u201cand\u201d must be used in lieu of a comma between the two ingredients. This same rule applies to products containing poultry.<sup>127</sup> However, it does not apply to mixtures of meat and poultry. An ingredient that conforms to a standard of identity (discussed above in connection with product names) is identified by the name specified by the applicable standard. When FDA standardized foods are used as ingredients in the preparation of meat or poultry products, the common or usual names of all ingredients in the standardized food must be listed, in parentheses, following the name of the standardized food (so-called '\u201ccomponent listing\u201d).<sup>128</sup> The Code of Federal Regulations and the Food Standards contain definitions for various food ingredients. Absent a specific FSIS requirement, the appropriate common or usual name as set forth by FDA is appropriate.<sup>129</sup> The Food Standards and Labeling Policy Book may also be consulted for recognized ingredient names. There are two methods by which ingredients and sub-ingredients may be declared within the ingredients statement. The ingredients of a standardized food that is used as an ingredient in a food may either (1) be declared parenthetically following the name of the standardized ingredient (i.e., '\u201ccomponent\u201d labeling,) e.g., '\u201ccheddar cheese (milk, enzymes, salt)\u201d or (2) declared by dispersing each ingredient in its order of predominance in the - 44 - ", "ingredients statement of the product in which they are used without naming the standardized food specifically (i.e., '\u201ccomposite\u201d labeling). Composite listing does not name the standardized food, (e.g., '\u201cmeatballs\u201d from various sources, each having similar but different formulations.) The affected ingredients in a composite declaration must be minor in nature and should be identified using one of the following acceptable formats: 1) Pepperoni (pork, beef, water, salt, spices, sodium nitrate (may also contain lactic acid starter culture, sugar, and sodium ascorbate)); 2) Bacon bits (cured with water, salt, dextrose and/or sugar, and sodium nitrite); or 3) Pepperoni (pork, beef, water, sweeteners (contains one or more of the following: sugar, dextrose, fructose, corn syrup), salt, spices, sodium nitrate).<sup>130</sup> FSIS allows the use of both component labeling and composite labeling within a singular ingredients statement. Certain naming conventions, including the grouping of ingredients identified by a single term, are specified by FDA regulation and followed by FSIS.<sup>131</sup> The ingredient name usually must be specific as opposed to generic. Synonymous terms are interchangeable. Examples of interchangeable terms are frank, hot dog, and weiner, or corn syrup and corn syrup solids.

B. Artificial Flavorings, Colorings, and Chemical Preservatives

1. Flavors

\u2013 Specificity or Generic Identification Rules governing the labeling of artificial flavorings, colorings, and chemical preservatives are focused on ensuring that a product\u2019s ingredients statement adequately informs a consumer of the product\u2019s content.<sup>132</sup> A 1995 '\u201cQuestion and Answer\u201d document issued by FSIS remains a valuable resource - 45 - ", "to address these and other ingredient labeling issues.<sup>133</sup> FSIS permits the term '\u201cflavorings\u201d to designate natural spices and natural spice extractives.

'\u201cSpices\u201d may be used to designate natural spices.<sup>134</sup> The meat species and poultry '\u201ckind\u201d must be identified as part of a flavor (e.g., '\u201cDried (species or kind) stocks,\u201d '\u201cDried (species or kind) broth\u201d) Such ingredients may not be declared simply as '\u201cflavors\u201d because dried stocks, dried broth and extracts, and

blood fractions are of animal origin and must be so designated as \u201cDried (species) stock,\u201d \u201cDried (species) broth,\u201d \u201c(species) extract,\u201d or \u201cDried (species) plasma.\u201d Only ingredients that fall within the regulatory definition may be declared as \u201cnatural flavor,\u201d \u201cnatural flavoring,\u201d \u201cflavor\u201d or \u201cflavoring.\u201d These include essential oils, oleoresins, and spice extractives. 135 The term \u201cspice\u201d is used to refer to those spices listed in FDA regulations. 136 Certain types of ingredients that are hydrolyzed must be identified by the source and cannot be identified generically as a \u201cflavor.\u201d Examples include: hydrolyzed (source) proteins, gelatin, hydrolyzed meat and meat by- products, autolyzed yeast, and autolyzed yeast extract. The terms \u201cartificial smoke flavoring added\u201d or \u201csmoke flavoring added\u201d must be on the product label next to the product name and identified in the ingredients statement. 137 The same requirement applies with respect to meat products in several specific instances in which artificial colorings are added to the product. 138 - 46 -,"2. Color Additives FSIS requires color additives or the lake of a color additive subject to FDA certification to be identified by its common or usual name or the abbreviated names such as \u201cFD&C Red No. 40,\u201d \u201cRed 40,\u201d \u201cFD&C Blue No. 1 Lake,\u201d or \u201cBlue 1 Lake.\u201d 139 Color additives not subject to certification may be declared generically such as \u201cArtificial Color\u201d or \u201cColor Added,\u201d or they may be designated as \u201cColored with \_\_\_\_\u201d or \u201c\_\_\_\_ color,\u201d with the blank filled with the name of the color additive. 140 Products containing any artificial coloring must note that fact on the immediate container of the product or, if there is none, the product itself. 141 3. Chemical Preservatives Containers of products containing any chemical preservative must state that fact on the label. 142 Additional rules apply to antioxidants and other additives (e.g., possible product name qualifiers.) With respect to poultry products containing chemical preservatives, FSIS clarifies that the label statement must name the chemical preservative and the purpose of its use. 143 C. Incidental Additives Federal regulations require that all ingredients used to formulate a meat or poultry product must be listed by their common or usual name on labeling. There are two exceptions to the rules. An ingredient that is classified by FDA as a secondary direct additive does not need to be labeled because it has only a momentary technical effect in food by definition. The other exception is for incidental additives according to FDA\u2019s labeling regulations. 144 - 47 -,"FSIS exempts the mandatory declaration of \u201cinidental additives\u201d from an ingredients statement if they are present in insignificant amounts and serve no technical or functional effect in food, are used as a processing aid, or have migrated to food from equipment or packing materials. 145 Processing aids are a subcategory of incidental additives and are not considered ingredients since they are essentially substances that are added to a food for their technical or functional effect in the processing but are present in the finished food at insignificant levels and do not have any lasting technical effect in that food. FSIS does not have a definition for incidental additives or processing aids. However, if a company believes that the use of a substance in the manufacture or formulation of a meat or poultry product is consistent with FDA\u2019s labeling definition for an incidental additive processing aid, then data needs to be submitted to FSIS to substantiate conformance with the FDA regulation. FSIS will determine on a case-by-case basis whether a request for the specific use of an ingredient is consistent with FDA\u2019s labeling definition of an incidental additive processing aid and thus, exempt from labeling.

These exceptions do not apply where FDA regulations require that use of a specific substance be disclosed for health or other reasons. For example, FDA requires that sulfiting agents that qualify as incidental additives must be labeled if present at levels exceeding an established level (10 ppm). 146 - 48 -,"D. Labeling of Ingredients of Public Health Concern Because there are foods and food ingredients to which some individuals may have a sensitivity (i.e., an allergic reaction or intolerance), FSIS emphasizes the importance of accurate, informative product labeling. FSIS supports including voluntary statements on labels to alert people who have sensitivities or intolerances to the presence of specific ingredients, particularly the \u201cbig 8\u201d allergens (wheat, crustaceans (e.g., shrimp , crab, lobster), eggs, fish, peanuts, milk, tree nuts (e.g., almonds, pecans, walnuts), and soybeans) and other specific ingredients (monosodium glutamate (MSG), sulfites, lactose, and Yellow 5 (tartrazine). FSIS provides the following example: \u201cContains: milk, wheat gluten, soy.\u201d FSIS further supports identifying the source of a specific ingredient in a parenthetical statement, (e.g., \u201cwhey (from milk)\u201d.) FSIS authorizes the use of factual labeling statements about a product\u2019s manufacturing environment, (e.g., \u201cProduced in a plant that uses peanuts,\u201d) where good manufacturing practices and effective sanitation standard operating procedures (SSOPs) cannot reasonably eliminate the unintended presence of certain ingredients. In certain circumstances, the phrase \u201cmay contain (name of allergenic ingredient)\u201d may be used on meat and poultry product labeling. However, the use of factual statements about a product\u2019s manufacturing environment, (e.g., \u201cProduced in a plant that uses peanuts,\u201d) and the use of \u201cmay contain\u201d statements, (e.g., \u201cmay contain peanuts\u201d) may only be used in cases where establishments show that adequate SSOPs cannot effectively eliminate the cross-contact issue. - 49 -,"The Agency will consider any non-misleading symbols, statements, or logos to inform consumers of the presence of ingredients of public health concern in meat, poultry, or egg products. All requests must be submitted to the Agency as a policy inquiry and not as label-approval submissions.

IX. ADDRESS (SIGNATURE) LINE [9 C.F.R. \u00a7 317.2(c)(3) & (g) (meat); 9 C.F.R. \u00a7 381.122 (poultry)] FSIS requires the labels of meat and poultry products to include the name or trade name and place of business of the manufacturer, packer, or distributor for whom the product is prepared. 147 The manufacturer or packer name may appear on the label without qualification. The name of the distributor, however, must be preceded by a phrase such as \u201cPrepared for \_\_\u201d or \u201cDistributed by \_\_.\u201d If the business is listed in a telephone or city directory, the information listed for the place of business must include the city, state, and postal ZIP code. Otherwise, it must also include the street address.

X. HANDLING STATEMENTS [9 C.F.R. \u00a7 317.2(k) (meat); 9 C.F.R. \u00a7 381.125(a) (poultry)] Packaged products that require special handling to maintain their wholesome condition must have prominently displayed on the principal display panel the applicable handling statement \u201cKeep Refrigerated,\u201d \u201cKeep Frozen,\u201d or \u201cPerishable\u201d \u201cKeep Refrigerated or Frozen.\u201d 148 The FSIS Administrator may also approve additional phrases of similar importance. - 50 -,"The statement \u201cKeep Frozen\u201d must appear on shipping containers for products that are distributed frozen and thawed prior to or during display for sale. Consumer-size containers holding such products must bear the statement \u201cPreviously Handled Frozen for Your Protection, Refreeze or Keep Refrigerated.\u201d With respect to perishable canned products, this statement must appear in upper case letters,

\u00bc inch in height, for containers with a net weight of 3 pounds or less, or \u00bd inch in height for containers with a net weight over 3 pounds. XI. SAFE HANDLING INSTRUCTIONS [9 C.F.R. \u00a7 317.2(l) (meat); 9 C.F.R. \u00a7 381.125(b) (poultry)] Safe handling instructions are required if the meat or poultry component of a product is raw or partially cooked (i.e., not considered ready-to-eat (RTE)), and if the product is destined for household consumers or institutional uses. 149 Safe handling instructions may appear on products that are not ready-to-eat (RTE) but include a fully cooked meat or poultry portion. Safe handling instructions should not be used on RTE products. Meat and poultry products intended for further processing at another official establishment also are exempt from this requirement. Under the heading \u201cSafe Handling Instructions,\u201d the safe handling information must appear on the label as follows. This product was prepared from inspected and passed meat and or poultry. Some food products may contain bacteria that could cause illness if the product is mishandled or cooked improperly. For your protection, follow these safe handling instructions. - 51 -,"This statement is in turn accompanied by the following additional required statements. \u2022 Keep refrigerated or frozen. Thaw in refrigerator or microwave. (This statement must appear next to a graphic illustration of a refrigerator.) 150 \u2022 Keep raw meat and poultry separate from other foods. Wash working surfaces (including cutting boards), utensils, and hands after touching raw meat or poultry. (This statement must appear next to a graphic illustration of soapy hands under a faucet.) \u2022 Cook thoroughly. (This statement must appear next to a graphic illustration of a skillet.) \u2022 Keep hot foods hot. Refrigerate leftovers immediately or discard. (This statement must appear next to a graphic illustration of a thermometer.) These instructions must appear in lettering no less than 1\16 inch in height and be placed on the label \u201cprominently with such conspicuousness as to render it likely to be read and understood under customary conditions of purchase and use.\u201d The heading must be set in type size larger than the rationale statement and instructions. All safe handling information must be set off by a border and appear in one color printed on contrasting background of a single color. 151 FSIS permits changes to the first statement and icon if specific handling information on the product conflicts with the safe handling instructions. For example, if the label of a frozen product states, \u201cDo not thaw product, cook from frozen,\u201d or \u201cDo not thaw,\u201d the first part of the safe handling statement may be changed to \u201cKeep Frozen.\u201d If a product is shelf stable and states, \u201cNo refrigeration necessary,\u201d or \u201cRefrigerate after opening,\u201d - 52 -,"the icon of the refrigerator and the entire statement about refrigeration can be eliminated. XII. NUTRITION LABELING A. Mandatory Nutrition Labeling - General Requirements In 1994, USDA adopted sweeping new regulations mandating that most foods bear nutrition labeling. Nutrition labeling now is required for all meat and poultry products intended for human consumption and offered for sale, except single-ingredient, raw products and other exempt products. Exempt products include products produced by small businesses, products intended for further processing, products not for sale to consumers, products prepared and sold at retail, and products in small packages (individually wrapped packages of less than \u00bd ounce net weight). 152 These exemptions are discussed more fully below, but it is important to note that with these exemptions, a nutrition claim, or any other nutrition information provided on the label or in labeling or advertising in any context and in any form, negates the exemptions and triggers the mandatory nutrition labeling requirements. The exemptions for certain other products, such as

products intended for export and custom-slaughtered products, are not negated by nutrition claims. 153 Generally, nutrition information must appear on the label of meat and poultry products. Gift packs may display nutrition information at a place other than on a product label, such as product label inserts, provided the label bears no nutrition claim. 154 Meat and poultry products in packages - 53 -,"having a total surface area greater than 40 square inches, but lacking sufficient space on the principal display panel and information panel for all required information, may use an alternate panel that customers could readily see. 155 A product\u2019s nutrients are declared on its label. Certain nutrients must be declared, while others may be declared voluntarily. 156 The order in which certain nutrients must be declared, as well as certain definitions and requirements, are set forth below (the voluntary nutrients are identified as such). 157 \u2022 Total Calories. \u2022 Calories from Fat. \u2022 Calories from Saturated Fat (voluntary). \u2022 Total Fat. Total fat is defined as the total lipid fatty acids and is expressed as triglycerides. \u2022 Saturated Fat. Saturated fat is defined as the sum of all fatty acids containing no double bonds. \u2022 Trans Fat (voluntary). \u2022 Stearic Acid (voluntary). \u2022 Polyunsaturated Fat (voluntary). Polyunsaturated fat is defined as the cis, cis-methylene-interrupted polyunsaturated fatty acids. \u2022 Monounsaturated Fat (voluntary). Monounsaturated fat is defined as the cis-monounsaturated fatty acids. \u2022 Cholesterol. \u2022 Sodium. \u2022 Potassium (voluntary). - 54 -,"\u2022 Total Carbohydrate. Total carbohydrate is determined by subtracting the sum of the crude protein, total fat, moisture, and ash from the total weight of the product. \u2022 Dietary Fiber. \u2022 Soluble Fiber (voluntary). \u2022 Insoluble Fiber (voluntary). \u2022 Sugars. Sugars are defined as the sum of all free mono- and disaccharides (such as glucose, fructose, lactose, and sucrose). \u2022 Sugar Alcohol (voluntary). Sugar alcohol is defined as the sum of saccharide derivatives in which a hydroxyl group replaces a ketone or aldehyde group and whose use in the food is listed by FDA. \u2022 Other Carbohydrate (voluntary). Other carbohydrate is defined as the difference between total carbohydrate and the sum of dietary fiber, sugars, and sugar alcohol, except that if sugar alcohol is not declared (even if present) other carbohydrates is defined as the difference between total carbohydrate and the sum of dietary fiber and sugars. \u2022 Protein. A statement of the number of grams of protein must be declared. Ordinarily it is not necessary to declare the percent of daily value of protein unless a protein claim is made for the product, or if the product is intended for children under 4 or infants. When the protein digestibility-corrected amino acid score (PDCAAS) of the food is less than 20 (for adults and children greater than 4,) or less than 40 (for children between 1 and 4,) either of the following shall be placed next to the protein content: (1) \u201cnot a significant source of protein,\u201d or (2) a listing of the corrected amount of protein, expressed as percent of daily value. \u2022 Vitamin A, Vitamin C, Calcium, and Iron. The percent of daily value must be declared for vitamin A, vitamin C, calcium, and iron, in that order, and any other vitamin or mineral for which a claim is made, provided FDA has established a recommended daily intake (RDI) for such vitamin and mineral. \u2022 Vitamins and Minerals (voluntary). The declaration of the percent of daily value of other vitamins and minerals is voluntary if the vitamins and minerals are required for use in a standardized food that is used as an ingredient in another food or included solely for technological purposes. (The listing of other vitamins and minerals that may be - 55 -,"declared in the nutrition facts panel can be found in Section F of this part) Generally, nutrient information must be presented using the nutrient names in the regulation, except \u201csugar

alcohol\ufe0f which may be declared by its specific name (e.g., xylitol) when there is only one sugar alcohol in the food. Detailed requirements are set forth specifying when each mandatory or voluntary nutrient must be declared. For example, nutrients whose declaration is usually voluntary must be declared when a claim is made about the nutrient.<sup>158</sup> With the exception of the core nutrients (calories, total fat, sodium, total carbohydrate, and protein), nutrients that are present in insignificant amounts may be omitted from the list of nutrients and grouped in a summary statement (e.g., \ufe0fNot a significant source of \_\_\_\_\ufe0f.) The level of a nutrient that can be declared as (rounded to) zero is specified. The regulations also state the analytical methods for measurement of each nutrient.<sup>159</sup> B. Full Format Nutrition information must be presented in a specified format and type size.<sup>160</sup> The order in which the nutrition information appears, and the headings that must be used, also are specified in regulations.<sup>161</sup> The quantitative amount of each nutrient must be declared, except for vitamins and minerals, which are expressed as a percent of daily value.<sup>162</sup> The percent of the Daily Reference Value (DRV), under the heading \ufe0f% Daily - 56 -","Value,\ufe0f must be declared for total fat, saturated fat, cholesterol, sodium, potassium (if declared), total carbohydrate, and dietary fiber. The percent of daily value must be calculated and declared in the increments specified in the regulation.<sup>163</sup> Typically, the nutrition panel also must contain a footnote, preceded by an asterisk that states: \ufe0fPercent Daily Values are based on a 2,000 calorie diet. Your daily value may be higher or lower depending on your calorie needs.\ufe0f<sup>164</sup> Additionally, the footnote must list the recommended daily values for the macronutrients on the basis of a 2,000 and 2,500 calorie diet. Calorie conversion information on a per gram basis may follow the footnote (e.g., \ufe0fCalories per gram: fat 9, carbohydrate 4, protein 4\ufe0f.)<sup>165</sup> Variations in the presentation of nutrition information are permitted under certain circumstances. For example, nutrition information may be presented for two or more forms of the food (e.g., \ufe0fas purchased\ufe0f and \ufe0fas prepared\ufe0f) per ounce\ufe0f and \ufe0fper 100 grams;\ufe0f The regulatory requirements for dual declarations must be followed. The primary column is the food as packaged.<sup>166</sup> Additionally, meat products that contain two or more products in the same package or packages that are used interchangeably for the same type of product may use an aggregate display, specifying the identity of each food next to the nutrition information.<sup>167</sup> This same format may be used to display information for two or more forms of the same product (e.g., raw and cooked.)<sup>168 - 57 -","C.</sup> Simplified Format A simplified format for nutrition information is permitted when a meat product contains \ufe0finsignificant\ufe0f amounts of any required nutrient other than core nutrients (calories, total fat, sodium, total carbohydrate, and protein.)<sup>169</sup> An \ufe0finsignificant amount\ufe0f of a nutrient is defined as that amount that may be rounded to zero in nutrition labeling, except that for total carbohydrate, dietary fiber, sugars, and protein, it is an amount that can be declared as less than 1 gram.<sup>170</sup> The simplified format must include: (1) Total calories, total fat, total carbohydrate, protein, and sodium; and (2) Calories from fat, as well as any of the mandatory nutrients that are present in the food in more than insignificant amounts. If any required nutrient, other than a core nutrient, is present in an insignificant amount, it may be omitted from the tabular listing, provided the nutrition label includes the statement \ufe0fNot a significant source of \_\_\_\_,\ufe0f (with the blank filled in with the mandatory nutrients that are present in insignificant amounts). Otherwise, this statement is not necessary.<sup>171</sup> The simplified nutrient information must be presented in essentially the same manner as required

for the general format. The simplified format must also contain the statement, \u201cPercent Daily Values are based on a 2,000 calorie diet,\u201d and, if the term \u201cDaily Value\u201d is not spelled out, a statement that \u201cDV\u201d represents \u201cDaily Value.\u201d - 58 -,"D. Tabular Format Packages with 40 square inches or less of available surface area may use a tabular label format. Extremely small labels that cannot accommodate the standard vertical column or tabular format may display the required nutrition information in a linear format specifically outlined by USDA. The use of this linear format is approved on a case-by-case basis. Because the linear format is very hard to read, companies must demonstrate that inability to fit the tabular format on the label. 172 Packages having 40 square inches or less of available labeling space may also use approved abbreviations as part of the nutrition facts panel. Below is a listing of the authorized abbreviations: Serving size- Serv size Servings per container- Servings Calories from fat- Fat cal Calories from saturated fat- Sat fat cal Saturated fat- Sat fat Monounsaturated fat- Monounsat fat Polyunsaturated fat- Polyunsat fat Cholesterol- Cholest Total carbohydrate- Total carb Dietary fiber- Fiber Soluble fiber- Sol fiber Insoluble fiber- Insol fiber - 59 -,"Sugar alcohol- Sugar alc Other carbohydrate- Other carb 173 E. Compliance Requirements Governing Nutrition Labeling In calculating and presenting nutrition information, manufacturers must follow the compliance rules established by USDA. Methods for analyses are provided in the Agency\u2019s \u201cChemistry Laboratory Guidebook.\u201d If no USDA method is available or appropriate for a nutrient, the 1990 edition of the \u201cOfficial Methods of Analysis,\u201d published by the AOAC International, should be followed. 174 F. Reference Daily Intakes and Daily Reference Values The label declaration of percent daily value of vitamins and minerals will be based on the following Recommended Daily Intake (RDI\u2019s): 175 \u2022 Vitamin A, 5,000 international units \u2022 Vitamin C, 60 milligrams \u2022 Calcium, 1.0 grams \u2022 Iron, 18 milligrams \u2022 Vitamin D, 400 international units \u2022 Vitamin E, 30 international units \u2022 Vitamin K, 80 micrograms \u2022 Thiamin, 1.5 milligrams \u2022 Riboflavin, 1.7 milligrams \u2022 Niacin, 20 milligrams \u2022 Vitamin B6, 2.0 milligrams - 60 -,"\u2022 Folate acid, 0.4 milligrams \u2022 Vitamin B12, 6 micrograms \u2022 Biotin, 0.3 milligrams \u2022 Pantothenic acid, 10 milligrams \u2022 Phosphorus, 1.0 gram \u2022 Iodine, 150 micrograms \u2022 Magnesium, 400 milligrams \u2022 Zinc, 15 milligrams \u2022 Copper, 2 milligrams The following Recommended Daily Intake (RDI) from the FDA regulations would also be permitted on a voluntary basis on USDA food products: \u2022 Selenium, 70 micrograms \u2022 Manganese, 2.0 milligrams \u2022 Chromium, 120 micrograms \u2022 Molybdenum, 75 micrograms \u2022 Chloride, 3,400 milligrams Immediately following the name of a nutrient or dietary component, the following synonyms may be used parenthetically: \u2022 Calories\u2014Energy \u2022 Vitamin C\u2014Ascorbic Acid \u2022 Thiamin\u2014Vitamin B1 \u2022 Riboflavin\u2014Vitamin B2 - 61 -,"\u2022 Folate\u2014Folic acid or Folacin (Alternatively, folic acid or folacin may be listed without parentheses in place of folate.) The label declaration of percent daily value of the following food components is based on the following Daily Recommended Value (DRV)\u2019s: \u2022 Fat, 65 grams \u2022 Saturated fatty acids, 20 grams \u2022 Cholesterol, 300 milligrams \u2022 Total carbohydrate, 300 grams \u2022 Fiber, 25 grams \u2022 Sodium, 2,400 milligrams \u2022 Potassium, 3,500 milligrams \u2022 Protein, 50 grams G. Exemptions from Mandatory Nutrition Labeling As discussed above, the regulations either exempt certain foods from the mandatory nutrition labeling requirements or subject other foods to special labeling

requirements. Generally, these exemptions only apply when a product's label and advertising make no nutrition claims and contain no nutrition information. The exemptions and the special labeling requirements, when applicable, are identified below.

176 Small Business. A company employing 500 or fewer people, specific products produced at 100,000 pounds of product per year or less qualifies for the exemption. All product based on the same formula is counted toward the 100,000-pound limit. For example, a business making pork sausage would aggregate the weight of its bulk, link, and patty products. Businesses may calculate the amount of pounds produced by averaging the most recent two years of production.

\u2022 Products Intended for Further Processing. \u2022 Products Not for Sale to Consumers. For example, a free sauce packet included with egg rolls does not require nutrition labeling. This packet, however, may not be included in the product's net weight. If the sauce packet is either included in the net weight or not free, nutrition labeling is required.

- 62 -

"\u2022 Individually-Wrapped Small Packages. Individually-wrapped packages of less than \u00bd ounce net weight are exempt.

\u2022 Products Custom Slaughtered or Prepared.

\u2022 Products Intended for Export Only.

\u2022 Certain Products Prepared and Sold or Served at Retail:

- o Ready-to-eat products packaged or portioned at retail
- o Multi-ingredient products (e.g., sausage) processed at retail

\u2022 Restaurant Menus.

\u2022 Foods for Infants and Children. Foods for children less than 2 years of age must bear nutrition labeling, except that the following nutrients may not be declared: calories from fat, calories from saturated fat, saturated fat, stearic acid, polyunsaturated fat, monounsaturated fat, and cholesterol. Foods represented or purported to be for infants and children less than four years of age must bear nutrition labeling, except that such information shall not include the percent of Daily Value (DV) and the footnote information. Nutrient names and quantitative amounts by weight must be presented in separate columns.

\u2022 Small Packages. Foods in packages that have a total surface area available for labeling of less than 12 square inches are exempt, but the label must contain an address or telephone number that may be used to obtain the required nutrition information (e.g., \u201cFor nutrition information, call 1-800-123-4567\u201d). When nutrition labeling is provided, either voluntarily or because of nutrition claims, all required information must meet certain size requirements.

H. Voluntary Nutrition Labeling

The nutrition labeling of single-ingredient, raw meat and poultry products is voluntary at this time. When voluntary nutrition labeling guidelines apply, a retailer or manufacturer must follow the mandatory nutrition labeling program with a few exceptions. Nutrition labeling may be declared \u201cas consumed\u201d or \u201cas packaged,\u201d and the number of servings per - 63 -

"\u2022 container need not be included. The simplified labeling format also may be used. When a retailer provides nutrition information at the point-of-purchase (e.g., signs or brochures), the listing of percent daily values of nutrients and required footnotes may be omitted, and formatting requirements do not apply. If a nutrition claim is made, however, all mandatory requirements apply.

\u201cSignificant participation\u201d in the voluntary nutrition labeling program is required; otherwise, the products under the voluntary nutrition labeling guidelines will become mandatory. A retailer is considered to be participating at a \u201csignificant\u201d level if it provides appropriate nutrition information for at least 90 percent of the major cuts of single-ingredient, raw meat and poultry it sells.

\u201cSignificant participation\u201d is evaluated every 2 years. Since participation in the voluntary nutrition labeling program was determined to be \u201cnot-significant\u201d in 1996 and 1999, FSIS

proposed mandatory nutrition labeling for products in the voluntary program. I. Serving Sizes

This section provides an overview of FSIS regulations concerning serving sizes, followed by a more detailed description of specific regulatory requirements such as how serving sizes are expressed on a product label. This section will also address reference amounts customarily consumed (RACC) per eating occasion and the conversion of RACC to labeled serving sizes (depending on the type and size of the product) and the exceptions to - 64 -,"these requirements. A summary of the procedures for determining the number of servings per container is also made available.

1. General Requirements For the purpose of nutrition labeling, nutrients and food components must be declared based on a serving of a food. \u201cServing size\u201d is defined as the amount of food customarily consumed per eating occasion, expressed in an appropriate common household measure. 177 The serving size is based on the established RACC for the particular food. Conversion from reference amount to serving size depends upon the nature of the product. For all meat and poultry products, the declaration of nutrient- and food-component content should be based on the product \u201cas packaged,\u201d except single-ingredient, raw product may be declared \u201cas consumed.\u201d There are two exceptions to raw, multi-ingredient products declaring nutrition information on the \u201cas purchased\u201d basis. FSIS has determined that for bacon products with a cook shrink of at least 60 percent and pork sausage type products with a cook shrink of at least 24 percent, the nutrition information may be declared on the \u201cas cooked\u201d basis only, since the nutrition information on the \u201cas packaged\u201d basis will not be useful to the consumer because the nutrient profile changes dramatically upon cooking. Cooking instructions must be included on the labeling of the bacon- and pork sausage-type products. All products may be declared in a second column \u201cas consumed\u201d if preparation and cooking instructions are clearly stated. - 65 -,"2. Common Household Measure

The serving size must be expressed in a \u201ccommon household measure\u201d which is defined as a cup, tablespoon, teaspoon, piece, slice, fraction (e.g., \u00bc pizza), ounce, or other common household equipment used to package food products (e.g., jar, tray.) The regulation lists in order of preference the measure that is suitable for the individual food: (1) cups, tablespoons, or teaspoons should be used whenever possible; (2) units such as piece, slice, tray, jar, and fractions of a whole (most appropriate for products such as pizza or quiche) are used when cup, tablespoon or teaspoon measurements are not applicable; and if neither of the prior two options are appropriate; (3) ounces, which must be expressed in 0.5-ounce increments. 178 Rounding should be indicated by the use of the term, \u201cabout.\u201d 179 Permitted abbreviations are specified by regulation.180 The common household measure should be followed by the metric quantity in parenthesis (e.g., \u201c2 slice [50 grams]\u201d,) except for single-serving containers. If a manufacturer voluntarily provides the metric weight for a single-serving product in the net-weight declaration, the serving-size declaration need not include the metric conversion (e.g., \u201cserving size 1 package.\u201d) However, if the metric weight is included in both the net-weight and the serving-size declaration, they must be identical. For single-serving products and meal-type products (e.g., can, box, package, meal, or dinner,) a description of the individual container or package should be used. For other products in discrete units (e.g., chop, - 66 -,"slice, link, patty,) a description of the individual unit should be used. For unprepared products used to prepare large discrete, units (e.g., pizza kit,) a fraction or a portion should be used.181 When no other unit is applicable, the serving size is

described in ounces. FSIS also permits ounce declarations for serving size for products in units like chicken breasts, pork chops, etc., if the individual units vary by more than 100% by weight. For example, when chicken breasts weigh between 3 ounces and 6 ounces, companies are permitted to label the product by ounces as opposed to the piece. When a serving size, determined by the reference amount, falls exactly halfway between two servings sizes (e.g., 2.5 tbsp), the size should be rounded up to the next incremental size. 182 All gram and milliliter quantities equivalent to the household measure should be rounded to the nearest whole number, except quantities less than 5 g (mL). Quantities between 2 and 5 g (mL) should be rounded to the nearest 0.5 g (mL), and quantities less than 2 g (mL) should be expressed in 0.1 g (mL) increments. 183 3. Reference Amounts Customarily Consumed (RACC) Per Eating Occasion The reference amounts reflect the amount of food customarily consumed per eating occasion and are based on the edible portion of food and on the major intended use of the food. There are alternate reference amounts for food intended for infants or children under 4 years old. 184 FSIS has approved the use of the following ready-to-serve RACCs listed below that are not codified in the regulation: - 67 -,"\u2022 Appetizers (e.g., Meat (or poultry) hors d\u2019oeuvres, mini eggrolls, mini pizza rolls, bagel pizza) - 85 grams RACC \u2022 Beans with meat (or poultry), plain or in sauce - 130 grams for beans in sauce or canned in liquid and refried beans prepared; 90 grams for others prepared; 35 grams dry RACC \u2022 Meat hot dog (or poultry hot dog) chili sauce \u2013 2 tbsp RACC \u2022 Paste for garnishing - 15 grams RACC \u2022 Stuffed cherry peppers - 30 grams RACC \u2022 Vegetables, sauce, and bacon bits (or poultry bacon bits) - 110 grams RACC \u2022 Rendered poultry fat \u2013 1 tbsp RACC The reference amount of a product that requires cooking or the addition of water or other ingredients is the amount required to prepare one reference amount of the final product. The reference amount for products that represent two or more foods packaged and presented to be consumed together (e.g., lunch meat with cheese and crackers) is typically the sum of the proportional reference amounts for each individual food in the package, provided the reference amount for the combination product is not specifically listed. Reference amounts must be used to determine whether a product meets the criteria for nutrient content claims and health claims. Reference amounts may be established or amended by submitting a petition to FSIS. The petition requirements are specified by regulation. 185 - 68 -,"4. Converting Reference Amounts Customarily Consumed (RACCs) to Labeled Serving Sizes a. Products in discrete units The serving size for products in discrete units (e.g., hot dogs, sliced luncheon meats) and products consisting of two or more foods packaged to be consumed together (e.g., beef fritters and barbecue sauce) generally is the number of whole units that most closely approximates the reference amount for the product category. If a unit weighs 67 percent or more, but less than 200 percent, of the reference amount, the serving size shall be one unit. If a unit weighs more than 50 percent, but less than 67 percent, of the reference amount, the manufacturer may declare one or two units as the serving size. If a unit weighs 200 percent or more of the reference amount, the manufacturer may declare the whole unit as one serving only if it can reasonably be consumed at a single eating occasion. 186 The serving size for products in large, discrete units that are usually divided for consumption (e.g., pizza, quiche) is the fractional slice of the food that most closely approximates the reference amount for the product category. The fractions are  $1\frac{1}{2}$ ,  $1\frac{1}{3}$ ,  $1\frac{1}{4}$ ,  $1\frac{1}{5}$ ,  $1\frac{1}{6}$ , or smaller fractions that can be divisible by 2 or 3. For packages used to prepare the large, discrete unit (e.g., pizza kits), the serving size may be the

fraction of the package used to make the reference amount of the large, discrete unit.<sup>187</sup> For assortments of meat or meat food products (e.g., variety packs), nutrient content may be expressed for the entire package or individual products. - 69 -,"b. Bulk products The serving size for bulk products (e.g., whole roast beef, whole chicken, large cans of chili, Individually Quick Frozen (IQF) chicken, vegetable pasta, and sauce products) and products consisting of two or more foods packaged to be consumed together (e.g., roast beef and potatoes) is the amount in household measure that most closely approximates the reference amount for the product category. For \u201cmixed dishes measurable by the cup\u201d sold as IQF products, the serving size is the amount of frozen product it takes to make 1 cup of the ready-to-serve product. This amount of frozen product is usually slightly larger than the 1 cup, ready-to-serve serving size since the product compacts when cooked. c. Meal-type products The serving size for meal products that come in single-serving containers is the entire content (\u201cedible portion only\u201d) of the package. The serving sizes for meal products that do not have RACCs are based on the RACC of the main ingredients and a portion of the other ingredients. For example if a meal consisted of a beef roast, gravy, and a separate package of potatoes, the company would base the serving size on 3 ounces of beef with the gravy and potato component proportioned evenly among the number of servings of the beef. Meal products do not base serving size on the sum of reference amounts. Additionally, FSIS has permitted companies to label multiple-serve meal products as a \u201cmeal for X\u201d and a serving size of \u201c1\x of package.\u201d - 70 -,"For a package containing two or more foods packaged and presented to be consumed together where the main ingredient is presented in discrete units (e.g., chicken fritters and corn), the serving size is the number of discrete units of the main ingredient, plus proportioned minor ingredients used to make the reference amount. A package containing several varieties of single-serving units, or a product having two or more compartments containing different foods, must provide nutrition information for each variety of food per serving size that is based on the reference amount for each food category. For single-serving containers, the serving size must be one unit. A product that is packaged and sold individually (i.e., single- serving containers) and that contains less than 200 percent of the reference amount, must be labeled as one serving. Products that have reference amounts of 100 grams (or 100 milliliters) or larger may declare the number of servings as either one or two when the package contains more than 150 percent but less than 200 percent of the reference amount. Packages sold individually that contain 200 percent or more of the reference amount may be declared as one serving if the entire package reasonably can be consumed in one eating occasion <sup>188</sup>. d. Exceptions There are four specified exceptions to the rules for converting reference amount to serving size: weight control products, meal products, variety packages, and single-serving containers. For products intended for - 71 -,"weight control and available only through a weight control program, a serving size may be selected by the manufacturer that is consistent with the meal plan of the program. Such products must bear a statement, \u201cfor sale only through the underlying\_\_\_\_\_ program (fill in the blank with the name of the appropriate weight control program,) (e.g., \u201cSmith\u2019s Weight Control\u201d.) 5. Servings Per Container Detailed procedures are established for determining the number of servings per container, including the increments in which the serving should be declared and procedures for rounding. The number of servings should be rounded to the nearest whole number, except the number of servings between 2 and 5 servings should be

rounded to the nearest 0.5 serving. Rounding should always be indicated by \u201cabout.\u201d 189 Random weight products may be declared as \u201cvaried\u201d provided the nutrition information is based on the reference amount expressed in ounces. When the serving size is required to be expressed on a drained solids basis and the number of servings vary because of natural variations in unit size (e.g., pickled pigs feet,) the manufacturer may state the typical number of servings per container as \u201cusually 5 servings.\u201d The number of servings in packages containing single-serving containers should be the number of individual containers. For packages containing several multi-serving units, the number of servings is determined by multiplying the number of individual multi-serving units by the number of servings in each individual unit. - 72 -,"The nutrient- and food-component content should always be based on the product as packaged or purchased. Products packed in water, brine, or oil not customarily consumed, however, shall declare the content of the drained solids.190 If oil or broth is included in the net weight, nutrition information must be declared for both the oil and broth. Product that is sold \u201cbone-in\u201d must determine the average percentage of bone and deduct that amount when calculating the number of servings per container. Those products commonly combined with other ingredients or otherwise prepared before consumption may declare nutrient contents on the basis of the product alone or \u201cas-consumed,\u201d provided that the type and quantity of the ingredients to be added and the specific method of preparation is specified. For example, a cream soup mix may be labeled with one set of Daily Values for the dry mix (per serving) and another set for the soup when prepared. 191 XIII. NUTRIENT CONTENT CLAIMS GENERALLY A. General Requirements 1. Basic Principles Claims A food label may not bear an express or implied claim that characterizes the level of a nutrient in a food (nutrient content claim) unless the term has been defined by regulations. 192 An express nutrient content claim is considered to be \u201cany direct statement about the level (or range) of a nutrient in the food\u201d (e.g., \u201clow sodium\u201d.) An implied nutrient content claim includes any claim that describes the food or an ingredient therein in a - 73 -,"manner that suggests that a nutrient is absent or present in a certain amount (e.g., \u201chigh in oat bran\u201d or \u201conly 6 grams of fat\u201d,) or suggests that the food, because of its nutrient content, may be useful in maintaining healthy dietary practices and is made in association with an explicit claim or statement about a nutrient (e.g., \u201chealthy, contains 3 grams of fat\u201d.) A manufacturer must comply with the nutrient content claim regulations if a label claim statement constitutes an express or implied claim. If a product label bears a nutrient content claim, nutrition labeling is required even if the product would otherwise be exempt. The RACCs are the basis for determining the serving size of foods and are used in determining whether a product meets the criteria for a nutrient content claim, unless otherwise specified. Claims may not be based on the level of a nutrient present in the declared serving size. If the declared serving size differs from the applicable reference amount and the product does not qualify for the claim based on the stated serving size, the claim must be followed by the criteria for the claim. In addition, the panel must include a statement referring the consumer to the nutrition label for information about the nutrient that is the subject of the claim (e.g., \u201cvery low sodium, 35 mg or less per 55 grams\u201d.) The criteria for the claim must be immediately adjacent to the most prominent claim in legible print and in a size no less than that required for net weight. 193 - 74 -,"2. Various General Requirements The regulations for the nutrition

labeling of meat and poultry products describe several general labeling requirements pertaining to nutrient content claims. For example, information provided as part of the nutrition panel is not considered a nutrient content claim. However, if this information is stated elsewhere on the label (e.g., on the principal display panel,) it could be considered an implied claim and regulated as such. 194 FSIS regulations also define what constitutes a \u201bsubstitute\u201d food. 195 A \u201bsubstitute\u201d food is one that may be used interchangeably with another food that it resembles (i.e., to which it is organoleptically, physically, and functionally similar,) and to which it is not nutritionally inferior. Products that are intended to be \u201bsubstitute foods,\u201d but are nutritionally inferior, must be labeled as an imitation food. The regulations provide further guidance concerning this definition. What constitutes a \u201bsubstitute food\u201d is relevant to many of the defined claims. Foods that qualify for a \u201clow\u201d claim, or labels that represent that a nutrient is absent, without the benefit of special processing, alteration, formulation, or reformulation, must bear a qualifying statement immediately accompanying the claim (e.g., \u201clard, a sodium-free food\u201d.) In addition, FSIS takes the position that \u201cfree\u201d or \u201clow\u201d before the name of a food implies that a food is lower in the particular nutrient than other foods of the same type. Therefore, only if a food has been specially processed, altered, formulated, or reformulated to produce a lower amount of the particular nutrient may it bear - 75 -,"a \u201cfree\u201d or \u201clow\u201d claim preceding the product name (e.g., \u201clow sodium beef noodle soup\u201d.) 196 Placement and prominence requirements are specified for nutrient content claims. The type size and style of a nutrient content claim may be no larger than two times that of the statement of identity of the food for which the claim is made. The regulations setting forth the specific definitions for each of the claims explained below include detailed placement and prominence requirements. Labeling information required to accompany certain nutrient content claim, whose type size is not specified by regulation, is required to be no less than 1\16 in height.197 3. Numeric and Percent Declarations A statement about the amount or percentage of a nutrient that implicitly characterizes the level of a nutrient is permitted if the food qualifies for a defined claim (e.g., \u201cless than 10 grams of fat per serving\u201d.) 198 If the food bearing the factual claim does not qualify for an applicable claim for the nutrient that is the subject of the factual statement, it must be accompanied by a disclaimer adjacent to the statement that the food is not low in, or a good source of, the nutrient for which the claim is made (e.g., only contains 200 milligrams of sodium per serving, not a low sodium food.) This requirement is intended to avoid a misleading impression that, for example, a food that contains \u201cless than 300 calories\u201d is a low calorie food. The regulations specify prominence and placement requirements for the disclaimer statement. Finally, a factual statement that does not implicitly characterize the level of a - 76 -,"nutrient and is not false or misleading is permitted and no disclaimer is required (e.g., \u201c100 calories\u201d or \u201c5 grams of fat\u201d.) Percent fat free claims are addressed separately and are explained below. 199 4. Relative Claims -- General Requirements Relative claims are those statements that compare the level of a nutrient in a food to the level of a nutrient in an appropriate reference food. Relative claims include: \u201clight,\u201d \u201creduced,\u201d \u201cless,\u201d (or \u201cfewer,\u201d) and \u201cmore.\u201d This section of the Guide discusses the basic requirements applicable to all relative claims. Later sections of the Guide that address each of the specific claim\u2019s definitions do not repeat

these general requirements. 200 a. Appropriate Reference Food FSIS regulations governing the use of reference foods must be followed. 201 Generally, for relative claims \u201cless,\u201d \u201cfewer,\u201d and \u201cmore,\u201d the reference food may be a similar product or a dissimilar product. For \u201clight,\u201d \u201creduced,\u201d and \u201caddded\u201d claims, the reference product should be a similar product. 202 b. Information that Must Accompany a Relative Claim The following explanatory information must accompany a relative claim: \u2022 identity of the reference food and the percentage (or a fraction) of the amount of the nutrient in the reference food by which the nutrient has been modified (e.g., 50 percent less fat than (reference food) or 1\3 fewer calories than (reference food)); and - 77 -, "\u2022 a clear and concise quantitative information statement comparing the amount of the subject nutrient in the product per labeled serving with that in the reference food must appear adjacent to the most prominent claim or on the information panel contiguous to the nutrition panel (e.g., fat reduced from 10 g to 5 g or calories reduced from 200 to 120.) A relative claim describing a reduction in the level of a nutrient (e.g., \u201clight,\u201d \u201creduced,\u201d) is not permitted if the nutrient content of the reference food qualifies as \u201clow\u201d for that nutrient. This restriction is intended to avoid use of the claim to highlight trivial reductions in the level of a nutrient. Use of the term \u201cmodified\u201d is separately defined. 203 A \u201cmodified\u201d claim may be used in the statement of identity (i.e., the product name) of a food that bears a relative claim (e.g., \u201creduced,\u201d), if followed immediately by the name of the nutrient whose content has been altered (e.g., \u201cmodified fat product\u201d.) The statement of identity must be accompanied by a comparative statement such as \u201ccontains 35% less than \_\_\_\_,\u201d and provide the explanatory information required for relative claims, as explained above. 204 5. Claims for Main Dish and Meal-Type Products are Defined Separately [9 C.F.R. \u00a7 317.313(l)&(m) (meat); 9 C.F.R. \u00a7 381.413(l) &(m) (poultry)] For the purpose of making a nutrient content claim, a \u201cmain dish product\u201d must do the following: 205 \u2022 make a significant contribution to the diet by weighing at least 6 ounces per labeled serving; \u2022 contain at least two 40-gram portions of food, or combinations of foods, from two or more of the following four food groups: (1) bread, cereal, rice and pasta; (2) fruits and vegetables; (3) milk, yogurt and cheese; - 78 - ; and (4) meat, poultry, fish, dry beans, eggs and nuts; excluding most sauces, as well as gravies, condiments, relishes, pickles, olives, jams, jellies, syrups, breadings, or garnishes; and \u2022 be represented as, or is in a form of a \u201cmain dish\u201d (e.g., not a beverage or dessert.) For the purpose of making a nutrient content claim, a \u201cmeal-type product\u201d must do the following: 206 \u2022 make a significant contribution to the diet by weighing at least 10 ounces per labeled serving; \u2022 contain at least three 40-gram portions of food, or combinations of foods, from two or more of the following four food groups: (1) bread, cereal, rice and pasta; (2) fruits and vegetables; (3) milk, yogurt and cheese; and (4) meat, poultry, fish, dry beans, eggs and nuts; excluding most sauces, as well as gravies, condiments, relishes, pickles, olives, jams, jellies, syrups, breadings, or garnishes; and \u2022 be represented as, or is in a form commonly understood to be, a breakfast, lunch, dinner, meal, or entr\u00e9e. 6. Exemptions Claims contained in the brand name of a product in use before November 27, 1991, that have not been defined are exempt from these specific regulatory restrictions, provided the brand name is not otherwise deemed false or misleading. 207 An exempt brand name must still comply with the requirements pertaining to the prominence of a

claim, the referral statement, and disclosure of nutrients in the referral statement. An implied nutrient content claim may otherwise be part of a brand name if the claim has been authorized by FSIS. Claims that are part of a product name by virtue of a standard of identity, as of November 27, 1991, are not subject to - 79 -,"the nutrient content regulations, nor would the name be deemed an implied claim or subject to the referral statement or disclosure requirements. Apart from brand names, a statement that describes the percentage of a vitamin or mineral in the food in relation to a Recommended Daily Intake (RDI) level, unless the claim is specifically prohibited, is exempt from the nutrient content claims regulations. 208 B. Specific Nutrient Content Claims 1. \u201cHigh,\u201d \u201cGood Source\u201d and \u201cMore\u201d Claims [9 C.F.R. 317.354 (meat) and 9 C.F.R. 381.454 (poultry)] A claim made about the level of a nutrient in a food in relation to the Recommended Daily Intake (RDI) or Daily Recommended Value (DRV) (excluding total carbohydrate) may only be made if the claim is defined within this section of the Guide. Therefore, claims may only be stated using the terms specified by the regulation. 209 a. \u201cHigh\u201d Claims The terms \u201chigh,\u201d \u201crich in,\u201d or \u201cexcellent source of\u201d may be used if the claimed nutrient is present in the individual food at 20 percent or more of the RDI or the DRV per reference amount customarily consumed (RACC). Main dish and meal products would qualify for this claim if the 20 percent level is reached and the label identifies the food component that is the subject of the claim (e.g., \u201cthe serving of broccoli in this product is high in vitamin C\u201d.) 210 - 80 -,"b. \u201cGood Source\u201d Claims The terms \u201cgood source,\u201d \u201ctranslates,\u201d or \u201cprovides\u201d may be used if the claimed nutrient is present in the individual food between 10 to 19 percent of the RDI or DRV per RACC. Main dish and meal products would qualify for this claim if the 10 to 19 percent level is reached and the label identifies the food component that is the subject of the claim. 211 c. \u201cMore\u201d Claims The comparative claim \u201cmore\u201d may be used to describe the level of protein, vitamins, minerals, dietary fiber, or potassium present in an individual food if the claimed nutrient is present in the food at 10 percent more of the applicable RDI or DRV per RACC as compared to an appropriate reference food. The explanatory information required for relative claims (explained above) must accompany the claim. 212 A \u201cmore\u201d or similar claim may describe a main dish or meal product if the food contains at least 10 percent more of the applicable RDI or DRV than an appropriate reference food, per 100 grams. The other requirements stated with respect to an individual food similarly apply to the claim when made for a main dish or meal product. 213 2. \u201cLight\u201d and \u201cLite\u201d Claims [9 C.F.R. 317.356 (meat) and 9 C.F.R. 381.456 (poultry)] The terms \u201clight\u201d and \u201clite\u201d may be used without further qualification. If a product derives 50 percent or more of its calories from fat, its fat content must be reduced by 50 percent or more per RACC as compared - 81 -,"to an appropriate reference food. If a product derives less than 50 percent of its calories from fat, the number of calories must be reduced by at least one- third per RACC or its fat content must be reduced by 50 percent or more compared to an appropriate reference product. As required with other relative claims, the identity of the reference product must be clearly declared, and quantitative information comparing the fat and calorie content of the product must be prominent. A \u201clight\u201d or \u201clite\u201d claim may not be made on a product that meets the definition of \u201clow fat\u201d or \u201clow calorie.\u201d The terms \u201clight\u201d and

\u201clite\u201d may be used on a main dish or meal- type product if the product qualifies for the \u201clow calorie\u201d or \u201clow fat\u201d claims and if a statement on the product\u2019s PDP explains the meaning of the claim. 214 3. \u201cSodium\u201d and \u201cSalt\u201d Claims a. \u201cSodium Free\u201d Claims The terms \u201csodium free,\u201d \u201cfree of sodium,\u201d \u201cno sodium,\u201d \u201czero sodium,\u201d \u201cwithout sodium,\u201d \u201ctrivial source of sodium,\u201d \u201cnegligible source of sodium,\u201d or \u201cdietary insignificant source of sodium\u201d may be used if the individual food contains less than 5 milligrams of sodium per reference amount (or in the case of a main dish or meal product less than 5 milligrams of sodium per labeled serving size). In addition, the food may not contain any ingredient that is sodium chloride or is generally understood by consumers to contain sodium unless the ingredient, as declared in the ingredients statement, is accompanied by an asterisk that refers consumers to the - 82 - ", "statement, \u201cadds a trivial amount of sodium,\u201d or a similar specified statement. If the food meets these conditions without the benefit of special processing, it must include an appropriate qualifying statement (e.g., \u201cleaf lettuce, a sodium free food\u201d.) 215 b. \u201cVery Low Sodium\u201d Claims The terms \u201cvery low sodium\u201d or \u201cvery low in sodium\u201d may be used if the individual food has an RACC that contains 35 milligrams or less per RACC (and per 50 grams if it is a small-serving size food). If the food qualifies for this claim without the benefit of special processing, an appropriate qualifying statement must accompany the claim (e.g., \u201cpotatoes, a very low sodium food\u201d.) 216 For a main dish or meal product, the sodium content is measured per 100 grams. The requirements for an individual food are otherwise applicable. 217 c. \u201cLow Sodium\u201d Claims The terms \u201clow sodium,\u201d \u201clow in sodium,\u201d \u201clittle sodium,\u201d \u201cccontains a small amount of sodium,\u201d or \u201clow source of sodium\u201d may be used if the individual food contains 140 milligrams or less sodium per RACC (and per 50 grams if it is a small-serving size food). Individual products with an RACC greater than 30 grams, or 2 tablespoons, and containing 140 mg or less sodium per RACC also qualify. 218 If the food qualifies for the claim without - 83 - ", "the benefit of special processing, an appropriate qualifying statement must accompany the claim (e.g., \u201cspinach, a low sodium food\u201d.) 219 For main dish and meal products, the food would qualify for this sodium claim if it contained 140 milligrams or less sodium per 100 grams. d. \u201cReduced Sodium\u201d Claims The terms \u201creduced sodium,\u201d \u201creduced in sodium,\u201d \u201csodium reduced,\u201d \u201cless sodium,\u201d \u201clower sodium,\u201d or \u201clower in sodium\u201d may be used if the individual food contains at least a 25 percent reduction in sodium as compared to an appropriate reference food. The claim must be accompanied by explanatory information required for relative claims. 220 For main dish and meal products, the 25 percent reduction in sodium is measured per 100 grams as compared to an appropriate reference food. The requirements for an individual food are otherwise applicable. No food may bear a \u201creduced sodium\u201d claim if the reference food qualifies for a \u201clow sodium\u201d claim. e. \u201cSalt\u201d Claims \u201cSalt\u201d is not considered synonymous with \u201csodium.\u201d References to salt content, such as \u201cunsalted,\u201d \u201cno salt,\u201d or \u201cno salt added,\u201d are deemed potentially misleading and subject to regulation. The term \u201csalt free\u201d may only be used if the food is \u201csodium free\u201d. In addition, the terms

\u201cunsalted,\u201d \u201cwithout added salt,\u201d and \u201cno salt added\u201d may be used for a food only if: (1) no salt is added during processing; (2) the food that it resembles and for - 84 -,"which it substitutes is normally processed with salt; and, (3) if it is not \u201csodium free,\u201d the statement \u201cnot a sodium free food\u201d is declared contiguous to the nutrition information on the information panel. 221 4. \u201cNutrient Content\u201d Claims for Fat, Fatty Acids and Cholesterol Content [9 C.F.R. 317.362 (meat) and 9 C.F.R. 381.462 (poultry)] a. \u201cFat Content\u201d Claims (1) \u201cFat Free\u201d Claims The terms \u201cfat free,\u201d \u201cfree of fat,\u201d \u201cno fat,\u201d \u201czero fat,\u201d \u201cwithout fat,\u201d \u201cnonfat,\u201d \u201ctrivial source of fat,\u201d \u201cnegligible source of fat,\u201d or \u201cdietarily insignificant source of fat\u201d may be used if the food contains less than 0.5 grams of fat per RACC or in the case of a main dish or meal product less than 0.5 grams of fat per labeled serving. In addition, the food may not contain any added ingredient that is a fat or is generally understood by consumers to contain fat unless the ingredient, as declared in the ingredients statement, is accompanied by an asterisk that refers consumers to the statement, \u201cadds a trivial amount of fat,\u201d or similar specified statement. If the food meets these conditions without the benefit of special processing, it must include an appropriate qualifying statement (e.g. \u201cbroccoli, a fat free food\u201d). 222 (2) \u201cLow Fat\u201d Claims The terms \u201clow fat,\u201d \u201clow in fat,\u201d \u201ccontains a small amount of fat,\u201d \u201clow source of fat,\u201d or \u201clittle fat\u201d may be used if the individual food contains 3 grams or less of fat per RACC, and per 50 grams if it is a small serving size - 85 -,"food. If the food qualifies for the claim without the benefit of special processing, it must be accompanied by an appropriate qualifying statement. A main dish or meal must meet the 3 grams or fewer criterion per 100 grams and not derive more than 30 percent of calories from fat. The requirements for an individual food are otherwise applicable. 223 (3) \u201cReduced Fat\u201d Claims The terms \u201creduced fat,\u201d \u201creduced in fat,\u201d \u201cfat reduced,\u201d \u201cless fat,\u201d \u201clower fat,\u201d or \u201clower in fat\u201d may be used if the individual food contains 25 percent less fat than the appropriate reference food. The claim must be accompanied by the explanatory information required for relative claims. For main dish and meal products, the 25 percent reduction in the fat is measured per 100 grams as compared to an appropriate reference food. The requirements for an individual food are otherwise applicable. No food may bear a \u201creduced fat\u201d claim if the reference food qualifies for a \u201clow fat\u201d claim.224 (4) \u201cPercent Fat-Free\u201d Claims A \u201cpercent fat-free\u201d or \u201cpercent lean\u201d claim is restricted to products that qualify as \u201clow fat.\u201d The percent reduction and the words \u201cfat free\u201d must be in uniform type size. Separately, a \u201c100 percent fat-free\u201d claim may only be made on foods that meet the criteria for \u201cfat-free,\u201d contain less than 0.5 grams of fat per 100 grams, and contain no added fat. A synonym for \u201cpercent fat free\u201d is \u201cpercent lean.\u201d225 - 86 -,"b. \u201cFatty Acid Content\u201d Claims Manufacturers must disclose the level of total fat and cholesterol in immediate proximity to a saturated fat content claim. Placement and prominence requirements are specified. Declaration of cholesterol content may be omitted if the food contains less than two milligrams of cholesterol per RACC (or per labeled serving for main dish and meal products), and fat content may be omitted if fat is present at 0.5 grams or less per reference amount (or per

labeled serving for main dish and meal products). The declaration of total fat may also be omitted if the food qualifies for a \u201clow fat\u201d claim. In addition to these general requirements, the regulation sets forth detailed requirements for specific claims that are permitted.<sup>226</sup> (1) \u201cSaturated Fat-Free\u201d Claims The terms \u201csaturated fat-free,\u201d \u201cfree of saturated fat,\u201d \u201cno saturated fat,\u201d \u201czero saturated fat,\u201d \u201cwithout saturated fat,\u201d \u201ctrivial source of saturated fat,\u201d \u201cnegligible source of saturated fat,\u201d or \u201cdietary insignificant source of saturated fat\u201d may be used if the food contains less than 0.5 grams of saturated fat and less than 0.5 grams trans fatty acid per RACC (or in the case of a main dish or meal product less than 0.5 grams of saturated fat and less than 0.5 grams trans fatty acid per labeled serving size).<sup>227</sup> In addition, the food may not contain any ingredient that is a saturated fat or is generally understood by consumers to contain saturated fat unless the ingredient, as declared in the ingredients statement, is accompanied by an asterisk that refers consumers to the statement, \u201cadds a - 87 -,"trivial amount of saturated fat,\u201d or similar specified statement. If the food meets these conditions without the benefit of special processing, it must include an appropriate qualifying statement. (2) \u201cLow In Saturated Fat\u201d Claims The terms \u201clin saturated fat,\u201d \u201clow saturated fat,\u201d \u201ccontains a small amount of saturated fat,\u201d \u201clow source of saturated fat,\u201d or \u201ca little saturated fat\u201d may be used if the individual food contains 1 gram or less of saturated fatty acids per RACC and not more than 15 percent of calories from saturated fatty acids. If the food qualifies for the claim without the benefit of special processing, it must be accompanied by an appropriate qualifying statement, which clearly refers to all food of its type and not merely to the particular food to which the label is attached.<sup>228</sup> For a main dish or meal product, the food must contain 1 gram or less of saturated fat and fewer than 10 percent calories from saturated fat, measured per 100 grams. The requirements for an individual food are otherwise applicable. (3) \u201cReduced Saturated Fat\u201d Claims The terms \u201creduced saturated fat,\u201d \u201creduced in saturated fat,\u201d \u201csaturated fat reduced,\u201d \u201cless saturated fat,\u201d \u201clower saturated fat,\u201d or \u201clower in saturated fat\u201d may be used if the individual food contains 25 percent less saturated fat per RACC than an appropriate reference food. The explanatory information required for relative claims must accompany the claim.<sup>229</sup> - 88 -,"For a main dish or meal product, the food must contain 25 percent less saturated fat per 100 grams than an appropriate reference food. The requirements for an individual food are otherwise applicable. A food cannot be labeled with a \u201creduced saturated fat\u201d claim if the reference food qualifies for a \u201clow saturated fat\u201d claim. c. \u201cCholesterol Content\u201d Claims (1) \u201cCholesterol Free\u201d Claims The terms \u201ccholesterol free,\u201d \u201cfree of cholesterol,\u201d \u201czero cholesterol,\u201d \u201cwithout cholesterol,\u201d \u201cno cholesterol,\u201d \u201ctrivial source of cholesterol,\u201d \u201cnegligible source of cholesterol,\u201d or \u201cdietary insignificant source of cholesterol\u201d may be used if: \u2022 the individual food contains 2 milligrams or less of cholesterol per reference amount (or in the case of a main dish or meal product per labeled serving size); \u2022 the food contains no ingredient generally understood by consumers to contain cholesterol, unless the ingredient, as declared in the ingredients statement, is accompanied by an asterisk which refers consumers to the statement, \u201cadds a trivial

amount of cholesterol,\u201d or similar specified statement; \u2022 the food contains 2 grams or less of saturated fat per reference amount (or for a main dish or meal product per labeled serving); and \u2022 the food qualifies for the claim without the benefit of special processing, it must include an appropriate qualifying statement. A main dish or meal product may generally bear a \u201ccholesterol free\u201d claim if it meets the requirements set forth above for individual foods, - 89 -,"but the 2 milligrams cholesterol and 2 grams saturated fat criteria are measured per 100 grams, rather than per reference amount. 231 (2) \u201cLow in Cholesterol\u201d Claims The terms \u201clow in cholesterol,\u201d \u201clow cholesterol,\u201d \u201ccontains a small amount of cholesterol,\u201d \u201clow source of cholesterol,\u201d or \u201clittle cholesterol,\u201d may be used to describe food that does not exceed the applicable disclosure level for total fat if the food: \u2022 has a RACC greater than 30 g or greater than 2 tbsp; \u2022 contains 20 milligrams or less of cholesterol per reference amount and per 50 grams if it is a small-serving size food; \u2022 contains 2 grams or less of saturated fat per reference amount; and \u2022 qualifies for the claim without the benefit of special processing, it must include an appropriate qualifying statement. A main dish or meal product may generally bear a \u201clow cholesterol\u201d claim if it meets the requirements set forth above for individual foods, but the 20 milligrams cholesterol and 2 grams saturated fat criteria are measured per 100 grams, rather than per reference amount.

232 (3) \u201cReduced Cholesterol\u201d Claims The terms \u201creduced cholesterol,\u201d \u201creduced in cholesterol,\u201d \u201ccholesterol reduced,\u201d \u201cless cholesterol,\u201d \u201clower cholesterol,\u201d or \u201clower in cholesterol\u201d may be used if the food: \u2022 has been specially formulated, altered or processed to reduce its cholesterol content by at least 25 percent from the reference food it replaces and for which it substitutes if the reference food has a - 90 -,"significant market share (i.e., 5 percent or more of a national or regional market); \u2022 contains 2 grams or less of saturated fat per reference amount; and \u2022 is accompanied by information required for relative claims. The placement and prominence requirements for the fat content statement are specified. A \u201creduced cholesterol\u201d claim is not permitted for any food if the reference food qualifies for a \u201clow cholesterol\u201d claim. The \u201creduced cholesterol\u201d claim also may be used on main dish or meal products if the product has been specifically formulated to reduce cholesterol by 25 percent, or if the main dish or meal contains 2 grams or less of saturated fat per 100 grams of product. 233 The identity of the reference product and the percent that the cholesterol has been reduced must be declared in immediate proximity to the \u201creduced cholesterol\u201d claim. 234 d. \u201cLean\u201d and \u201cExtra Lean\u201d Claims The term \u201clean\u201d may be used to describe an individual food as packaged when it contains less than 10 grams of fat, 4.5 grams or less of saturated fat, and less than 95 milligrams of cholesterol per reference amount and per 100 grams. For a main dish or meal to qualify as \u201clean,\u201d it must meet these specified levels for fat, saturated fat, and cholesterol per 100 grams and per labeled serving. The term \u201cextra lean\u201d may be used to describe products that contain less than 5 grams of total fat, less than 2 grams of saturated fat, and less than 95 milligrams of cholesterol per reference amount and per 100 - 91 -,"grams. For main dish or meal products, these levels apply per 100 grams and per labeled serving size. 235 5.

\u201cFiber\u201d Claims A claim that represents the level of dietary fiber in a food is permitted if the level of the nutrient would qualify for a claim (i.e., \u201chigh,\u201d

\u201cmore,\u201d or \u201cgood source\u201d.) If the food is not low in total fat, the label must disclose the level of total fat per labeled serving (e.g., \u201ccontains 12 grams (g) of total fat per serving\u201d.) This statement must appear in immediate proximity to the claim. 236 6. \u201cHealthy\u201d Claims The term \u201chealthy\u201d or any other derivative of the term \u201chealth\u201d may be used to describe an individual food provided the food (1) meets the requirements for \u201clow fat\u201d and \u201clow saturated fat;\u201d (2) does not contain more than 60 milligrams of cholesterol per RACC and labeled serving size (per 50 grams if the RACC is less than 30 grams); (3) does not contain more than 480 milligrams of sodium per RACC and labeled serving size (per 50 grams if the RACC is less than 50 grams); and (4) contains 10 percent or more of RDI or DRV per reference for one of the following: vitamin A, vitamin C, iron, calcium, protein, or fiber. Single-ingredient, raw foods need not meet the sodium requirement, and instead of meeting the fat and cholesterol requirements, single-ingredient, raw foods may meet the total fat, saturated fat, and cholesterol criteria for \u201cextra lean.\u201d 237 A \u201chealthy\u201d main dish or meal must meet the requirements for low - 92 -,"fat and low saturated fat requirements for main dish and meal-type products (i.e., 3 grams or less of total fat per 100 grams of product and not more than 30 percent of the calories from fat, and 1 gram or less of saturated fat per 100 grams of product and less than 10 percent of the calories from saturated fat.) Main dish and meal-type products that weigh less than 12 ounces per serving (container) cannot contain more than 60 milligrams of cholesterol per labeled serving while main dish and meal-type products weighing more than 12 ounces per serving (container) may contain no more than 90 milligrams of cholesterol per labeled serving. Additionally, main dish and meal-type products may contain up to 600 milligrams of sodium. Main dish products weighing 6 to 10 ounces per serving need only meet the RDI or DRV level for two of the listed nutrients, and meal-type products weighing 10 or more ounces need only meet the level for three of the nutrients. 238 7. Claims Related to Usefulness in Reducing or Maintaining Body Weight Any food that purports to be or is represented for special dietary use because of usefulness in reducing or maintaining body weight shall bear (1) nutrition labeling, unless exempt, and (2) a conspicuous statement of the basis upon which the food claims to be of special dietary usefulness. If the food achieves its special dietary usefulness by use of a non-nutritive ingredient (i.e., one not utilized in normal metabolism), the label must contain a statement that discloses the non-nutritive ingredient and its percentage by weight, except if such ingredient is a non-nutritive sweetener, in which case the percentage by weight does not have to be declared. 239 If a nutritive - 93 -,"sweetener, as well as a nonnutritive sweetener is added, the presence of both must be declared. Foods purporting to be \u201clow calorie,\u201d \u201creduced calorie,\u201d or otherwise containing fewer calories than a reference food must comply with the nutrient content claim regulations. Except as provided below, a food may be labeled with terms such as \u201cdiet,\u201d \u201cdietetic,\u201d \u201cartificially sweetened,\u201d or \u201csweetened with non-nutritive sweetener\u201d only if the claim is not false and misleading and the food is labeled \u201clow calorie\u201d or \u201creduced calorie\u201d or bears another comparative claim according to the nutrient content claim regulations. The exemptions to the previous requirement include (1) the use of a term that is specifically authorized by regulation governing a particular food, or, unless otherwise restricted by regulation, to any use of the term \u201cdiet\u201d that clearly shows that the food is offered

solely for dietary use other than regulating body weight (e.g., for low sodium diets); and (2) the use of a term on a formulated meal replacement or other food that is represented to be of special dietary use as a whole meal.<sup>240</sup> 8. \u201cHealth\u201d Claims A \u201chealth\u201d claim describes a relationship between a food and a disease or health-related condition. FSIS has not issued regulations providing for the use of a \u201chealth\u201d claim. Many such claims have been authorized for use by FDA on labeling of food products subject to its jurisdiction. FSIS will consider on a case-by-case basis the use of an FDA-regulated \u201chealth\u201d claim or such a \u201chealth\u201d claim in conjunction with a - 94 - ", "third-party certification program. An example is the American Heart Association\u2019s heart-check mark, which maintains its own criteria for eligibility and includes a \u201chealth\u201d claim in conjunction with its certifying mark (e.g., \u201cMeets American Heart Association food criteria for saturated fat and cholesterol for healthy people over age 2. While many factors affect heart disease, diets low in saturated fat and cholesterol may reduce the risk of this disease.\u201d) 9. \u201cCalorie Content\u201d Claims a. \u201cCalorie Content\u201d Claims (1) \u201cCalorie Free\u201d Claims The terms \u201ccalorie free,\u201d \u201cfree of calories,\u201d \u201cno calories,\u201d \u201czero calories,\u201d \u201cwithout calories,\u201d \u201ctrivial source of calories,\u201d \u201cnegligible source of calories,\u201d or \u201cdietary insignificant source of calories\u201d may be used if the individual food contains less than 5 calories per reference amount. If the food meets the requirements without the benefit of special processing, the claim may be accompanied by a statement such as, \u201ca low calorie food\u201d (e.g., cider vinegar, a calorie free food.)<sup>241</sup> (2) \u201cLow Calorie\u201d Claims The terms \u201clow calorie,\u201d \u201cfew calories,\u201d \u201ccontains a small amount of calories,\u201d \u201clow source of calories,\u201d or \u201clow in calories\u201d may be used if the individual food contains no more than 40 calories per reference amount (except for sugar substitutes) and per 50 grams for dehydrated products, etc., if it is a small-serving-size food. A small\u2013serving-size food is a food with a - 95 - ", "reference amount of 30 grams or less or 2 tablespoons or less (\u201csmall serving size food\u201d). If the food qualifies for the claim without the benefit of special processing, it must be labeled to clearly refer to all products of its type and not merely the particular brand to which the label attaches (e.g., \u201ccelery, a low calorie food\u201d.) The requirements for a \u201clow calorie\u201d main dish or meal product are similar. That is, these products must contain 120 calories or less per 100 grams and meet the other requirements specified above for individual foods. 242 (3) \u201cReduced Calorie\u201d Claims The terms \u201creduced calorie,\u201d \u201cred in calories,\u201d \u201ccalories reduced,\u201d \u201cfewer calories,\u201d \u201clower calorie,\u201d or \u201clower in calories\u201d may be used if an individual food contains at least 25 percent fewer calories per RACC as compared to an appropriate reference food. The claim must be accompanied by explanatory information required for relative claims. For a main dish or meal product, the 25 percent reduction in calories is measured per 100 grams as compared to an appropriate reference food. The requirements for an individual food are otherwise applicable. The claim is not permitted for any food if the reference food meets the definition of \u201clow calorie.\u201d 243 b. \u201cSugar Content\u201d Claims (1) \u201cSugar Free\u201d Claims The terms \u201csugar free,\u201d \u201cfree of sugar,\u201d \u201cno sugar,\u201d \u201czero sugar,\u201d \u201cwithout sugar,\u201d \u201c

\u201csugarless,\u201d \u201ctrivial source of sugar,\u201d \u201cnegligible source of - 96 -","sugar,\u201d or \u201cdietary insignificant source of sugar\u201d may be used if the food contains less than 0.5 grams of sugar per RACC (or in the case of a main dish or meal product per labeled serving.) In addition, the food may not contain any ingredient that is a sugar or is generally understood by consumers to contain sugars or sweeteners unless the ingredient, as declared in the ingredients statement, is accompanied by an asterisk that refers consumers to the statement, \u201cAdds a trivial amount of sugar,\u201d or a similar specified statement. The food must be labeled \u201clow calorie\u201d or \u201creduced calorie\u201d or bear a relative claim of special dietary usefulness, or the \u201csugar free\u201d claim must be accompanied by the statement, \u201cnot a low calorie food,\u201d or a similar specified statement. 244 (2) \u201cNo Added Sugar\u201d Claims The terms \u201cno added sugar,\u201d \u201cwithout added sugar,\u201d and \u201cno sugar added\u201d may be used only if: \u2022 no amount of sugars, or any other ingredient that contains sugar that functionally substitutes for added sugars, is added during processing or packaging; \u2022 the product does not contain an ingredient containing added sugars, such as jam, jelly, or concentrated fruit juices; \u2022 the sugar content has not been increased by the amount present in the ingredients by the use of enzymes or similar means, except where the intended functional effect of the process is not to increase the sugar content of a food, and a functionally-insignificant increase in sugars results; and \u2022 the food that it resembles and for which it substitutes normally contains added sugars. - 97 -","\u2022 In addition, if the food does not qualify as \u201clow calorie,\u201d a statement must direct the consumers\u2019 attention to the nutrition panel for further information on sugar and calorie content. The requirements governing \u201csugar free\u201d claims are not applicable to a factual statement that a food is unsweetened, or contains no added sweeteners in the case of a food that contains apparent substantial inherent sugar content (e.g., juices). 245 (3) \u201cReduced Sugar\u201d Claims The terms \u201creduced sugar,\u201d \u201creduced in sugar,\u201d \u201csugar reduced,\u201d \u201cless sugar,\u201d \u201clower sugar,\u201d or \u201clower in sugar\u201d may be used if the sugar content in the individual food is reduced by 25 percent per RACC as compared to an appropriate reference food. The claim must be accompanied by the explanatory information required for relative claims. For main dish and meal products, the 25 percent reduction in sugars is measured per 100 grams as compared to an appropriate reference food. The requirements for an individual food are otherwise applicable. 246 - 98 -","Appendix A Egg Products Labeling I. Egg Products Labeling Egg product labels bearing official USDA identification markers must be approved and comply with all applicable regulations. There are seven requirements for egg products labeling: product name; manufacturer\u2019s name; official identification; USDA approval number; ingredients statement; net weight statement; and nutrition information. a. Product Name Eggs are defined as the \u201cshell egg\u201d of the domesticated chicken, turkey, duck, goose, or guinea. Egg products are any dried, frozen, or liquid eggs, with or without added ingredients. 247 All egg product labels must include the name and state of the product, (e.g., dried, frozen, liquid, or whole egg, egg yolks, egg whites,) and must appear in print size similar to the most prominent printing on the label. In addition, a trade name may be used in conjunction with the product identity. Products formulated from eggs that do not meet the applicable definitions must be identified by an appropriately descriptive name that is not false or misleading. Food products

containing eggs in relatively small proportions or which historically have not been considered to be egg products may not be labeled as an egg product (e.g., omelet mix, egg nog mix, noodles, cake mixes). 248 These products, along with imitation egg products are eligible for identification with the USDA inspection legend only under the voluntary egg products inspection program. 249 Whole Eggs Liquid or frozen whole eggs are eggs of domestic hens broken from the shells with the yolks and whites in their natural proportion. 250 A combination of whites and yolks in other than natural proportions, such as accidentally broken whole eggs, may be identified as whole eggs provided the egg solids content is standardized to 24.2% or greater. 251 Whole eggs may be mixed, or mixed and strained, and must be pasteurized or otherwise treated to destroy all viable Salmonella micro-organisms. Dried eggs (or dried whole eggs) or frozen eggs are prepared by drying or freezing liquid eggs with such precautions that the finished food is free of viable Salmonella micro-organisms. If the glucose content of the eggs was reduced during the drying process, the statements "Glucose removed for stability" or "Stabilized, glucose removed" must immediately follow the product name. 252 - 99 -,"Egg Yolks Egg yolks, liquid egg yolks, yolks, and liquid yolks are yolks of eggs of the domestic hen so separated from the whites thereof as to contain not less than 43 percent total egg solids. 253 Egg yolks may be mixed, or mixed and strained, and must be pasteurized or otherwise treated to destroy all viable Salmonella micro-organisms. Egg yolks may be dried or frozen according to applicable regulations. Dried egg yolks (or dried yolks) or frozen egg yolks are prepared by either drying or freezing egg yolks with such precautions so that the finished food is free of viable Salmonella micro-organisms. Similar label statements for glucose removal must be included if necessary. Egg Whites Egg whites, liquid egg whites, or liquid egg albumen is the food obtained from eggs of domestic hens, broken from the shells and separated from the yolks. 254 Egg whites may be mixed, or mixed and strained, and must be pasteurized or otherwise treated to destroy all viable Salmonella micro-organisms. Any optional use of ingredients such as whipping aids must be named on the PDP or panels of labels prominently and conspicuously so ordinary individuals under customary conditions of purchase are likely to understand them. 255 Egg whites may be dried or frozen according to applicable regulations. If egg whites are dried, the product name may be "dried egg whites," or "egg white solids." If the lysozyme and avidin content of the product is reduced during the drying process, the product name must be immediately preceded or followed by the statement "lysozyme and avidin reduced." 256 When dried eggs are used in another fabricated food product, these statements do not need to follow the product name.

b. Manufacturer's Name Under the Fair Packaging and Labeling Act, the name and place of business of the manufacturer, packer, or distributor must be included on the PDP. 257 The statement of the place of business must include the street address, city, state and zip code; however, the street address may be omitted if it is shown in a current city directory or telephone directory. 258

c. Official Identification The U.S. Department of Agriculture maintains inspections of all official plants and the processing of egg products under the authority of the Egg Products Inspection Act. 259 Each official egg processing plant granted - 100 -,"inspection services is assigned an official plant number. 260 A shield containing the letters "USDA" is the official identification symbol, and when it is used in connection with an egg product, it constitutes a representation that the product has

been officially inspected. Egg products that bear the inspection mark must be processed in an official plant from edible shell eggs or other edible egg products. 261\ Plants may not have more than one plant number. The official shield must be printed on the PDP of the label using the design and wording shown below. The plant number may be printed within the shield or elsewhere on the container. 262\ When the plant number is not printed within the shield, the letter \u201cP\u201d or the word \u201cPlant\u201d must precede it. When the official shield is used on more than one label panel, it must be identically printed for each use. If a label does not bear all mandatory labeling information, it may not bear the official shield. In addition, all shell eggs packaged for consumers must be labeled to indicate that refrigeration is required, (e.g., \u201cKeep Refrigerated\u201d,) or words of similar meaning. 263 d. USDA Approval Number Labels for use on egg products must be preapproved. A separate label approval number containing one letter and a three-digit number (e.g., M001) is assigned to each label that has been approved. The assigned USDA approval number must be printed within a rectangular box and needs to be no larger than the smallest printing on the label. Labels identifying imported egg products will contain a two-letter prefix, (e.g., CN001) and labels approved for identification of products for export only will have a one-letter code. Self-adhesive strip labels may be used without approval; in conjunction with previously-approved printed labels provided the strip label does not cover any required labeling information showing the packer or - 101 -,"distributor\u2019s name and address; the product identity for whole eggs, egg yolks, or egg whites; or the state of the product. duction of egg products. Each of the ingredients used in egg products must be declared on the label as required by 21 C.F.R. Parts 101 and 130. Ingredients must be or frozen egg products. The percentage of water added must be declared on the label in the ingredients statement in descending order of proportion by weight and shown gredient is used, the label must bear the statement, \u201cNot more than 1 percent silicon dioxide added as an anticaking a ed t the national office, the label must state that the additive has been added to color the product. This declaration may be made in the ingredients statement, (e.g., \u201ccannatto extract (artificial color)\u201d or \u201ccolored with annatto extract.\u201d) 267 e es in the net weight statement. A dual declaration net weight statement is only required on retail packages containing less than 4 pounds. e. Ingredients Statement Only food-grade ingredients may be used in the pro listed in order of descending proportion by weight on the PDP. When approved, potable water may be added as a carrier for certain ingredients and additives used in the formulation of liquid as either \u201c\_\_\_\_ % water\u201d or \u201cwith \_\_\_\_ % water as a carrier.\u201d 264 When optional ingredients, such as monosodium phosphate, are used as preservatives, the label must bear the statement \u201cMonosodium phosphate (or monopotassium phosphate), with \_\_\_\_ percent water as a carrier, added to preserve color.\u201d 265 The blank must be filled in with the percent by weight of water used in proportion to the weight of the finished food. This optional ingredients statement must appear on the PDP or panels prominently and conspicuously. If an optional anticaking in gent,\u201d or \u201cLess than 2 percent sodium silicoaluminate added as an anticaking agent,\u201d whichever is applicable. 266 Color may not be added to whole eggs, egg yolks, egg whites, salt or sugared whole eggs, and salted or sugared egg yolks. Any egg product tha contains an additive which imparts color, including color additives certified as being natural, are considered to be artificially colored, and the product label must state that color has been added. If the color additive is derived from a natural source and a letter of

certification is provided to f. Net Weight Statement Each egg product label must contain a net weight statement. Th net weight statement must appear in the lower 30 percent of the label in lin generally parallel to the base on which the package rests and must appear as a distinct item on the label. The statement must be separated from any other printing above, below, or to either side of it by a space at least equal to the height of the letters - 102 -,"Regulations for the declaration of net quantity of contents can be found at 21 C.F.R. \u00a7 101.105. must compl rition labeling is required when nutrients, such as proteins, r information is presented on the labeling, except if a nutrient is included in the product solely for technological purposes. If a nutrient is included solely for technological purposes it may be declared solely in the ingredients statement. 269 g. Nutrition Information Egg or egg product labels which may be distributed for retail sale y with FDA regulations governing nutrition labeling. 268 Egg products packaged for institutional use are not required to bear nutrition information, however, if a nutrient content or health claim is made, product labeling must comply with all nutrient content claim regulations. Nut vitamins, and minerals are added to the product, or when a nutritional claim o - 103 -,"End Notes 1 21 U.S.C. \u00a7\u00a7 601 et seq. (meat); 21 U.S.C. \u00a7\u00a7 451 et seq. (poultry). 2 FSIS also regulates the labeling of egg products. These separate requirements are summarized at Appendix A of this Summary. 3 A misbranded food bears false or misleading labeling, while an adulterated food contains a poisonous or deleterious substance or otherwise poses a risk to consumer health. FSIS and FDA have established procedures for the joint review of ingredients that are not addressed in this Guide. See the FSIS website. 32 See 9 C.F.R. Parts 310, 318, 319, and 381. FSIS regulations establish a general prohibition on the use in a meat or poultry product of any food ingredient that would render it adulterated - 104 -,"or misbranded, or which is not approved in Parts 424, 318, and 319 of the regulations, or \"by the Administrator [of FSIS] in specific cases.\\" The Section further provides that ingredients and sources of radiation listed or approved for use in meat and poultry products in 21 C.F.R. (i.e., FDA's regulations) will be listed for such use in FSIS's regulations \"unless precluded from such use or further restricted in Parts 318 or 319 (pertaining to meat products), or Subparts O and P, of Part 381 (pertaining to poultry products). For example, a product standard might not permit the use in a particular product of an ingredient otherwise approved for use in meat or poultry. The Administrator may also list or approve for use in the new combined table of approved substances any such food ingredients or sources or radiation. 33 [ADD ingredient references] 34 15 U.S.C. \u00a7 52. 35 15 U.S.C. \u00a7 45(a)(l). 36 Fresh Grown Preserve Corp. v FTC, 125 F.2d 917 (2d Cir. 1942) (FTC has jurisdiction to prevent unfair competition by means of false labeling and misbranding, regardless of the kind of product). 37 15 U.S.C. \u00a7 45. 38 FTC\u2019s deception and advertising substantiation policy statements have been adopted in Commission decisions, and are intended to guide manufacturers as to what level of substantiation is necessary to support a claim. See Deception Policy Statement, appended to Cliffdale Associates, Inc., 103 F.T.C 110, 174-184 (1983); Ad Substantiation Policy Statement, appended to Thompson Medical Co., 104 F.T.C. 648, 839-42 (1984), aff\u2019d, 1986-1 Trade Cas. (CCH) \u00b6 67,103 (D.C. Cir. 1986). [SBS Update cites] 39 For example, claims relating to health and safety concerns, such as claims about the healthfulness of a particular product, require a relatively high level of substantiation. See National Commission on Egg Nutrition, 89 FTC 89, 192 (1976), aff\u2019d 570 F.2d 157 (7th Cir.), cert. denied, 439 U.S. 821 (1978); Thompson Medical Co., 104 FTC at 821. 40 See Houbigant v. Federal Trade Commission, 139 F.2d 1019 (2d Cir. 1944), cert. denied, 323 U.S. 763 (1944) (FDA does not have exclusive jurisdiction over false and misleading labeling); Fresh Grown Preserve Corp., 125 F.2d 917. [SBS Update cites] 41 15 U.S.C. \u00a7\u00a7 52, 53(a). Upon violation of final cease and desist orders, FTC can seek: (1) consumer redress in the form of recession or reformation of contracts, refunds, or damages, 15 U.S.C. \u00a7 57b(b); (2) civil penalties, 15 U.S.C. \u00a7 45(m); or (3) criminal penalties if a violation of section 12 was committed with intent to defraud or expose consumers to health and safety risks. 15 U.S.C. \u00a7 54(a). 42 See Warner-Lambert Co. v. FTC, 562 F.2d 749 (D.C. Cir. 1977), cert. denied, 435 U.S. 950 (1978). 43 Under the Supremacy Clause of the U.S. Constitution, U.S. Const., Art VI cl. 2., federal laws and regulations are held to preempt state legislation in two circumstances. First, federal law is intended to preempt when a state legislates in a field that Congress intended to occupy. Second, when state and federal laws are in direct conflict, and compliance with both is impossible, federal law takes precedence. 44 21 U.S.C. \u00a7 678 (meat); 21 U.S.C. \u00a7 467(e) (poultry). 45 Rath Packaging Co., 430 U.S. 519 (1977). 46 Id. See also American Meat Institute v. Pridgeon, 724 F.2d 45 (6th Cir. 1984)

(state statute requiring posting of placards indicating product's nonconformance with state ingredient standards held unconstitutional); *Armour v. Ball*, 468 F.2d 76 (6th Cir. 1972), cert. denied, 411 U.S. 981 (1973) (marking, labeling, packaging, and ingredient requirements of FMIA preempt any state-imposed labeling requirements). 47 *Kraft Foods North America, Inc. v. Rockland County*, (S.D.N.Y. Feb. 26, 2003) (Memorandum Order granting motion for summary judgment). An appeal of this decision was dismissed. 48 As noted previously, labeling includes all labels or other written, printed, or graphic matter on or accompanying the article. 21 U.S.C. \u00a7 321(m), 601(o)(p), 453(s). See *U.S. v. Jorgensen*, 144 F.3d 550, 558 (S.D. Cal. 1998)(brochures accompanying meat product are considered - 105 -,"labeling); see also *Kordell v. United States*, 335 U.S. 343 (1948); *United States v. Sene X Eleemosynary Corporation*, 479 F. Supp. 970, 979 (S.D. Fla. 1979) (neither physical attachment nor concurrent shipment of labeling is required to give FDA jurisdiction). 49 See 9 C.F.R. \u00a7 317.2(a); 9 C.F.R. \u00a7 381.1(b). 50 See 9 C.F.R. \u00a7 301.2 and 381.1(b) (definition of \u201cimmediate container\u201d); 9 C.F.R. \u00a7 317.2 (definition of \u201cprotective covering\u201d); See also Policy Memo 090B (Directive 7220.1) and the Food Standards and Labeling Policy Book at 137 (\u201cProtective Coverings, Poultry\u201d entry). 51 See, e.g., 9 C.F.R. \u00a7 316.10(b) (markings for smaller varieties of sausage); and 9 C.F.R. \u00a7 327.14 (foreign meat cuts must bear \u201cProduct of (country of origin)\u201d). 52 \u201cSketch\u201d labeling is a printer's proof or equivalent, which clearly shows all labeling features, size, location and indication of final color. Sketch labels can be hand-drawn, computer generated or by other reasonable facsimile. 53 FSIS Directive 7220.1 (including Policy Memorandum 114A (August 18, 1994)). 54 At one time, raising claims relating to the absence of antibiotic drug residues were allowed by FSIS. Now, FSIS is requiring that the few remaining programs be phased out. See FSIS website for further information on regulation of animal production and related claims. 55 9 C.F.R. \u00a7 317.4(a) (meat); 9 C.F.R. \u00a7 381.132(a), 9 C.F.R. \u00a7 320.14(b) (11)(meat); 9 C.F.R. \u00a7 381.175(b)(6) 56 9 C.F.R. \u00a7 317.4(f) (meat); 9 C.F.R. \u00a7 381.132(f) (poultry). 57 9 C.F.R. \u00a7 317.4(f)(2). 58 Under the rule, FSIS will select samples of generically-approved labeling from the records maintained by companies and institute appropriate action if false or misleading labeling is identified. 59 9 C.F.R. \u00a7 317.5 (meat); 9 C.F.R. \u00a7 381.133 (poultry). 60 9 C.F.R. \u00a7 317.2(b); 9 C.F.R. 381.115(b). 61 9 C.F.R. \u00a7 317.2(d) (meat); 9 C.F.R. \u00a7 381.116 (poultry). Various labeling rules specify particular prominence and placement requirements beyond this general requirement. 62 Such information may not be obscured by packaging or labeling design, vignettes, crowding, or lack of contrasting colors, which could be confusing and thus deemed misbranded under the labeling statutes. 9 C.F.R. 317.2 (meat); 9 C.F.R. \u00a7 381.116 (poultry). 63 9 C.F.R. \u00a7 317.2 (meat); 9 C.F.R. \u00a7 381.116 (poultry). 64 Id. 65 9 C.F.R. \u00a7 317.2 (meat); 9 C.F.R. \u00a7 381.121 (poultry). 66 See FSIS Directive 7220.1 (Policy Memorandum 87A) (September 16, 1985)). 67 9 C.F.R. \u00a7 381.171. 68 21 U.S.C. \u00a7 601(n)(7) (meat); 21 U.S.C. \u00a7 453(h)(7) (poultry). 69 9 C.F.R. \u00a7 319 et seq. USDA follows the FDA regulation as a matter of policy.

USDA\u2019s treatment of incidental additives differs from that of FDA in one respect. In declaring sulfites that are sometimes considered incidental additives, when the total product contains less than 10 ppm sulfites but a separable component contains more than 10 ppm, USDA requires that the sulfiting agent be declared in the ingredients statement. Policy Memorandum 094B (December 17, 1986). FDA provides that a sulfite is exempt from labeling as an incidental additive if it is less than 10 ppm only for the product as a whole. 21 C.F.R. \u00a7 101.100(a)(4). 146 21 C.F.R. \u00a7 101.100(a)(4). 147 9 C.F.R. \u00a7 317.2(c)(3) and (g) (meat); 9 C.F.R. \u00a7 381.122 (poultry). 148 9 C.F.R. \u00a7 317.2(k) (meat); 9 C.F.R. \u00a7 381.125(a) (poultry). 149 9 C.F.R. \u00a7 317.2(l) (meat); 9 C.F.R. \u00a7 381.125(b) (poultry). 150 Any portion of this statement in conflict with the product\u2019s specific handling instructions may be omitted. 151 9 C.F.R. \u00a7 317.2(l) (meat); 9 C.F.R. \u00a7 381.125(b) (poultry). 152 9 C.F.R. \u00a7 317.400 (meat); 9 C.F.R. \u00a7 381.500 (poultry). 153 9 C.F.R. \u00a7 317.400 (meat); 9 C.F.R. \u00a7 381.500 (poultry). 154 9 C.F.R. \u00a7 317.302(b) (meat); 9 C.F.R. \u00a7 381.402(b) (poultry). 155 9 C.F.R. \u00a7 317.302(c) (meat); 9 C.F.R. \u00a7 381.402(c) (poultry). - 108 -, "156 9 C.F.R. \u00a7 317.309(c) (meat); 9

To prevent recurrence of recalls attributable to these causes, FSIS is issuing this guidance to establishments to reiterate and emphasize: 1) Resources on the validation and application of antimicrobial agents or processes for effective control of LM; 2) Recommendations on the validation and application of antimicrobial agents or processes; and 3) Sanitation practices to control Listeria in RTE operations. I. Resources on the Validation and Application of Antimicrobial Agents or Processes The FSIS \u2018Compliance Guidelines To Control Listeria monocytogenes in Post-lethality Exposed Ready-to-Eat Meat and Poultry Products\u2019 (LM compliance guidelines, May 2006) provide the following guidance and resource materials on conducting challenge studies.

([http://www.fsis.usda.gov/oppde/rdad/FRPubs/97013F/LM\\_Rule\\_Compliance\\_Guidelines\\_May\\_2006.pdf](http://www.fsis.usda.gov/oppde/rdad/FRPubs/97013F/LM_Rule_Compliance_Guidelines_May_2006.pdf)) \u2022 Some published studies about challenge studies regarding the use of antimicrobial agents are available. FSIS\u2019 general observations based on these studies are found on pp. 59-67 of the LM compliance guidelines. \u2022 Attachment 7 on pp. 93-97 of the LM compliance guidelines gives definitions and an explanation of challenge studies, validation, shelf life studies, and summaries of published challenge studies. These summaries give the critical variables used in the challenge study, such as time, temperature, pH, concentration, and others, and the results of the challenge study in terms of log reduction of LM. \u2022 A link to the article (p. 101 of the Lm compliance guidelines): GUIDELINES FOR CONDUCTING LISTERIA MONOCYTOGENES CHALLENGE TESTING OF FOODS ( Scott et al., 2005) is available at [www.foodprotection.org/publications/TOCarchive/2005TOC/November2005.htm](http://www.foodprotection.org/publications/TOCarchive/2005TOC/November2005.htm) This article gives guidance on how to conduct a challenge study for antimicrobial agents and post-lethality treatments to determine suppression, reduction, or inactivation of LM. It addresses factors to be considered when conducting a challenge study, such as strains of L. monocytogenes to be used, inoculum level, inoculum preparation and method of inoculation, formulation of the product, delivery of the lethal treatment, incubation of samples, length of the study, frequency of sampling, and sample analyses. \u2022 Another resource article for

conducting challenge studies for validation of antimicrobial agents is the article on p. 101 of the compliance guidelines: CONSIDERATIONS FOR ESTABLISHING SAFETY-BASED CONSUME-BY DATE LABELS FOR REFRIGERATED READY-TO-EAT FOODS (NACMCF, 1","2004)

[www.fsis.usda.gov/ops/nacmcf/2004/NACMCF\\_Safetybased\\_Date\\_Labels\\_082704.pdf](http://www.fsis.usda.gov/ops/nacmcf/2004/NACMCF_Safetybased_Date_Labels_082704.pdf)

This article, developed by the National Advisory Committee on Microbial Criteria for Foods (NACMCF), gives guidance on how to determine the shelf-life of a RTE product containing an added antimicrobial agent that is supposed to suppress LM growth during the refrigerated shelf-life. Most studies use the temperature which the product is normally held during storage as the temperature during shelf life studies, e.g., refrigerated temperature of 38-40\u00b0 F. Shelf-life studies also should use or include a temperature of 45\u00b0 F which reflects consumer handling. The NACMCF document recommended to using a higher temperature for shelflife studies because foods can encounter a range of temperatures below and above 45\u00b0 F, with higher temperatures more likely in grocery store cases and during consumer handling. Therefore these temperatures more accurately reflect reality. A product with an added antimicrobial agent showing L. monocytogenes growth of <2 log at a storage temperature of 38-40 \u00b0 F and at 45\u00b0 F or above would be viewed by FSIS as more protective of public health than another product showing the same growth only when stored at 38-40\u00b0 F. Establishments planning to conduct shelf life studies can use the guidance for other factors important in designing a shelf life study provided in the full NACMCF report cited above. \u2022 FSIS Directive 7120.1, Amendment 13 (August 16, 2007 through October 23, 2007, i.e., the date of publication of the last amendment) is an updated list of substances, including antimicrobial agents that have been accepted by FSIS for use in the production of meat and poultry products. This list is available at:

[http://www.fsis.usda.gov/Regulations\\_&\\_Policies/7000\\_SeriesProcessed\\_Products/index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/7000_SeriesProcessed_Products/index.asp) \u2022 The FSIS Web site contains new technologies, including studies and application of antimicrobial agents or processes and post-lethality treatments that may be used in post-lethality exposed RTE products.

[http://www.fsis.usda.gov/Regulations\\_&\\_Policies/New\\_Technologies/index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/New_Technologies/index.asp) II. Validation and Application of Antimicrobial Agents or Processes An establishment can validate antimicrobial agents or processes in its RTE product or product formulation using a challenge study for the product, a published study or modeling program. In addition to the information from the resources listed in Section I, establishments should consider the following recommendations on the validation and application of antimicrobial agents or processes:

Conducting a Challenge Study Conducting a challenge study is one way to validate the effectiveness of an antimicrobial agent\process or any post-lethality treatment. A challenge study can determine the ability of LM to grow in a food, show the effectiveness of an antimicrobial agent in suppressing LM growth, and the ability of a post-lethality treatment to reduce LM. 2","\u2022 A challenge study should be conducted by a microbiologist trained in these studies. The challenge study should be conducted in a food microbiological laboratory and not in the establishment. \u2022 A University Extension Service may help in finding the appropriate microbiologist and laboratory for the study or provide guidance in conducting a challenge study. \u2022 There are a variety of antimicrobial agents approved for use to suppress growth of L. monocytogenes. The necessary information on the use of the antimicrobial agent can be obtained from the manufacturer. \u2022 A challenge study

conducted for the specific product of the establishment provides a better means to validate compared to the use of a published study or a modeling program. In this case, the product formulation and critical variables for the specific product are used. When using lactate or diacetate for the study as the antimicrobial agents, check the moisture content of the finished product so that it is the same as that recommended for the level of lactate or diacetate being used. One of the findings in the RTE cooked chicken product recall is that the validation showed that exceeding the product moisture content limits recommended for the use of lactates and diacetates for the particular formulation resulted in LM growth. An article by Seman et al., (2002), referred to on p. 61 of the LM compliance guidelines emphasized the importance of MOISTURE CONTENT in the application of lactates and diacetates as antimicrobial agents. The article says, "The results show that increasing amounts of potassium lactate syrup and sodium diacetate decreased the growth rate of *L. monocytogenes*, while increasing finished product moisture increased the growth rate. Sodium chloride content was not significant but was found to have a negative correlation to growth rate. This study provided a useful model in determining the target amounts of potassium lactate and sodium acetate for cured meat product formulations to inhibit the growth of *L. monocytogenes*. The calculations would also require knowledge of the finished product sodium chloride and moisture contents." Table 2 from the study shows that different finished product moisture levels, amount of sodium chloride, and lactate and diacetate result in different levels of LM growth rate. The following are excerpts from the published study. % salt % sodium T h % diacetate % potassium lactate syrup % product moisture LM growth rate (wk-1) 1.50 0.15 7.0 74.0 0.0 1.50 0.05 2.5 74.0 0.0991 2.20 0.20 4.75 64.5 0.0 2.20 0.10 0.25 64.5 0.1338 3", "The investigators advised that this validated model is specific to the products designed for the study and the *L. monocytogenes* strains used. Testing of this model in other environments and with other *Listeria* spp., and to formulations that are outside the model's limits may result in different maximum growth rates. For the shelf life study, use at least two sets of temperatures: 1) The refrigerated temperature that the product is usually maintained and stored, e.g., 40 °F; and 2) A higher temperature to reflect consumer handling, e.g., 45 °F. An antimicrobial agent or process showing less than 2 log<sub>10</sub> growth of LM when stored at these temperatures during the product's shelf-life is considered protective of public health. Note: A criterion of no more than 1 log<sub>10</sub> growth of Lm during 1.3 times the expected shelf life of the product at 8 °C (46 °F) can put the product in the no growth category. Use of a temperature at or below 8 °C was cited by the FSISFDA risk assessment to be protective of public health because this would achieve a predicted estimate of 50 % reduction in the number of cases of listeriosis in deli meats. FSIS compliance guidelines suggest the potential of reduced regulatory sampling for products in which growth is equal to or less than 1 log<sub>10</sub> throughout the product's shelf life. Verify the effectiveness of the antimicrobial agent/process used by testing for LM growth during the shelf life of the product, at a certain frequency. Maintain and monitor records of validation, verification, and corrective actions for deviations from the effective application of antimicrobial agents/processes. Using Published Studies for Validation Establishments can seek guidance from University Extension Service specialists or authors of the studies on how to apply the controls from a published challenge study. If using a published study or modeling program, use the same product or product formulation, treatment, and procedure as in the

study. Applying the treatment to a different product or product formulation may result in a different rate of growth inhibition. \u2022 Use the same critical variables of time and temperature of treatment, concentration, pH, moisture, water activity, fat, salt content, time and temperature of storage, packaging material, packaging atmosphere, and other critical variables or factors detailed in the study. \u2022 Use the same or similar product or product formulation, procedures, and equipment as those detailed in the study. \u2022 If using product, product formulation, treatments, or other critical variables that are different from those in the published study, conduct additional validation using the new variables and verify the effectiveness of the antimicrobial agent in the product after the treatment by testing for LM growth during shelf-life storage. \u2022 Use only validated studies, published studies, and modeling programs that include a shelf-life study. 4", "When using challenge studies, use only those showing that the LM growth or growth rate is lower in the product with antimicrobial agent\process than in product without antimicrobial agent\process. \u2022 Use only challenge studies showing that the antimicrobial agent\process used in the product suppressed growth of LM throughout the commercial shelf life of the product at < 2 log<sub>10</sub> growth, or better growth suppression. \u2022 Obtain the necessary information on the use of the antimicrobial agent from the manufacturer. \u2022 Verify the effectiveness of the antimicrobial agent\process used by testing for LM growth during the shelf life of the product, at a certain frequency. \u2022 Maintain and monitor records of validation, verification, and corrective actions for deviations from the effective application of antimicrobial agents\processes. Using a Modeling Program for Validation \u2022 Modeling programs can be obtained from published studies or from the manufacturer of an antimicrobial agent. Information and guidance on the application of the antimicrobial agent may be obtained from the manufacturer. \u2022 Establishments can also seek guidance from University Extension Service specialists or authors of the modeling programs on how to use a modeling program. \u2022 If using a modeling program to determine the amount of antimicrobial agent to use, follow the directions with regards to salt content, moisture level of the finished products, and other information needed. For example, a modeling program may ask to confirm that the product is a cured product because the model is only valid for cured products. It will ask for the following: Shelf life of product in days, product specification, salt content (%) and finished product moisture content (%). The program will calculate the amount of lactate\diacetate to be used and the log suppression of LM based on the information provided. \u2022 Growth models on the use of antimicrobial agents are available mostly for cured products. For uncured products where there are no growth models, validation studies need to be conducted per product. \u2022 Verify the effectiveness of the antimicrobial agent\process used by testing for LM growth during the shelf life of the product, at a certain frequency. \u2022 Maintain and monitor records of validation, verification, and corrective actions for deviations from the effective application of antimicrobial agents\processes.

### III. Sanitation Practices to Control Listeria in RTE Operations

The use of antimicrobial agents or processes in a product does not mean that control of the sanitation in the RTE operation can be neglected. The effectiveness of the antimicrobial activity is affected by the level of microbial contaminants on equipment surfaces and in the processing environment. The 2007 recall of RTE chicken breast products showed that sanitation plays a great role in controlling LM contamination in the product and in the processing environment. The FSIS LM compliance guidelines include 5", "recommendations

for sanitation controls in RTE processing plants; Section G, I-VI, of the compliance guidelines include guidance to establishments on sanitation control. Section G-VII gives guidance on testing frequencies for food contact surfaces and recommended validated methods for testing. The following recommendations are developed as a result of findings from the 2007 LM recall. Most of these are found in the guidance contained in the FSIS LM Compliance Guidelines, Section G I-VII, but are being highlighted for establishments to take extra notice. Establishments should consider the following recommendations on sanitation controls.

A. Listeria sanitation program

- \u2022 Maintain a record of all food contact surfaces and environmental surfaces in the processing area that are to be tested. Focus on the sites that are likely to be contaminated or that tested positive in the past. Make sure all of the identified surfaces are actively sampled and have an equal opportunity of being sampled during each sampling event.
- \u2022 Include the supporting documentation of the testing frequency in your LM sanitation program.
- \u2022 Include testing and monitoring of drains after an LM positive finding.
- \u2022 Do not use LM testing to support that LM is a hazard not reasonably likely to occur. LM testing is a verification of the effectiveness of the establishment's food safety program to control LM.
- \u2022 Include supporting documentation in the Sanitation SOP or other prerequisite program to support your claim in the HACCP plan that LM is a hazard not reasonably likely to occur in your RTE processing.
- \u2022 Include supporting documentation for the alternative chosen for the product.
- \u2022 When there is a repeated LM positive finding, suspend RTE operations to determine the cause or origin of the contamination and develop measures for removal of contamination and prevention of recurrence and to verify that there is no remaining contamination.
- \u2022 Sample food contact surfaces and environmental surfaces at other points of the production process, in addition to sampling at pre-op and about 3 hours after production has started.

B. Sanitation Procedures Dripping, Condensation and Standing Water

- \u2022 IMMEDIATELY address and correct problems of dripping, condensation and standing water. *L. monocytogenes* is an environmental pathogen and may be present in dripping, standing water and condensation. The moist environment caused by condensation is conducive to the growth of the pathogen.
- \u2022 Stop production of RTE products during repairs and corrective actions for these 6", "problems.
- \u2022 Clean and sanitize equipment and the processing area after all the repairs and corrective actions are finished.
- \u2022 Verify effective sanitizing of equipment and of the processing area environment after the repairs or construction by tests showing that LM or *Listeria spp.* tested negative, before resuming RTE production.
- Personnel Hygiene

  - \u2022 Train and require personnel to wash hands before putting gloves on.
  - \u2022 Train and require personnel to wash hands before resuming duties after breaks.
  - \u2022 Train personnel on hygienic practices in an RTE processing establishment once a month.
  - \u2022 Monitor personnel hygiene practices.

- Separation of RTE and Non-RTE Areas

  - \u2022 If processing both RTE and raw products, completely separate the processing areas, such as by complete wall separation or by scheduling processing on different days. If separate processing areas or scheduling on different days is not possible, schedule RTE processing first, then follow with raw products processing.
  - Always have a complete clean-up and sanitization after each processing and pre-op testing of equipment and processing area environment before starting RTE processing.
  - \u2022 Use separate equipment for RTE and raw processing. If separate equipment is not possible, schedule to use equipment for RTE processing first, then for raw processing.
  - \u2022 Assign different personnel for RTE and raw

processing areas, especially if both are conducted on the same day. If not possible, have personnel clean hands very well and use unused, clean coats, new gloves and hairnets, and sanitized boots for RTE processing. \u2022 Restrict movement of personnel from and to NRTE area during RTE processing. If necessary, use footbath, wash hands, and use new gloves and clean, unused coats and hairnets when returning to RTE area processing. \u2022 Locate coat racks for coats used in RTE processing in an identified RTE area. \u2022 Use color coded coats for use in RTE processing area, in raw processing area, and in other areas. \u2022 Maintain procedures so that personnel coming from any area common to RTE and raw processing are not transferring contamination to RTE areas. \u2022 Establish procedures for moving equipment from a non-processing area to a RTE processing area to prevent Listeria contamination from the equipment and during the moving operation. \u2022 Avoid passing raw product through RTE areas and RTE product through raw production areas. \u2022 Do not allow RTE product to come in contact with surfaces or raw products in 7", "coolers. Records of Sanitation Procedures \u2022 Keep records of sanitation procedures to be used in conjunction with processing of RTE products that are covered by the Listeria rule. \u2022 Maintain monitoring records of sanitation procedures. \u2022 Maintain records of preventive measures taken after a finding of direct product contamination, including the steps taken to clean the affected equipment or environmental surface, or to modify the procedure affected; other corrective actions employed, verification that the corrective action will prevent recurrence of the deviation; dates of the deviation, corrective action, and verification; and identification of personnel involved in addressing the contamination. Room Temperature \u2022 Maintain temperature in processing areas and packaging rooms as stated in the HACCP plan, Sanitation SOPs, or Prerequisite Programs. \u2022 Maintain cold temperature (<50\u00ba F) in packaging room for products that are to be refrigerated or frozen, as stated in the HACCP plan, Sanitation SOPs, or Prerequisite Programs, to prevent LM growth in the RTE processing environment. \u2022 Monitor temperatures as stated in the HACCP plan, Sanitation SOPs, or Prerequisite Programs. Miscellaneous \u2022 For establishments processing deli salads and similar products, establish procedures to ensure that other non-meat or non-poultry RTE ingredients do not cause cross-contamination with Listeria. \u2022 Maintain an effective rodent and insect infestation preventive and control program. Rats, mice and insects are sources of Listeria and other microbial contamination. \u2022 Develop and maintain procedures to ensure that sanitizer concentrations in footbaths are adequately maintained. \u2022 Maintain records and verify the correct procedures for the concentrations and mixing of sanitizers. \u2022 Maintain a rotation of sanitizers used. \u2022 Avoid the creation of aerosols and airborne dust when cleaning equipment or surfaces during operation. \u2022 Discard products that touch environmental surfaces, such as products falling on the floor or on the conveyor belt. \u2022 During cleaning and sanitizing, make sure food residues are not left on the equipment. \u2022 Maintain procedures for routine cleaning and develop procedures for intensified cleaning. 8", "\u2022 When adding ingredients to second container, do not to bang or contact the first container against the interior of the other container. C. Facilities and Equipment \u2022 IMMEDIATELY FIX leaky roof, broken and cracked equipment, floors, doors, windows, etc. Suspend operations during leakage and during repairs. Test the environment for Listeria spp. after repairs are finished and resume operation only after tests are negative. \u2022 DISCARD rusty, pitted, peeling tools or parts of equipment and replace with new, smooth-surfaced ones. These rusty,

pitted tools and equipment parts serve as ideal places for LM to grow and multiply. \u2022 Always dismantle equipment for cleaning and sanitizing. \u2022 Remove equipment not in use from the RTE processing area. \u2022 Use equipment according to the intended use, with the recommended cleaning and sanitizing procedures. \u2022 Document equipment maintenance and monitoring to check for broken, pitted, rusty, peeling, or dirty equipment needing replacement, repair, cleaning, etc. \u2022 Choose equipment that is designed to be easily assembled, cleaned and sanitized. D. Dual-Jurisdiction Establishments FDA regulated products produced in dual jurisdiction establishments are not subject to FSIS regulations. Therefore they do not have to comply with 9 CFR Parts 416, 417, or 430. FSIS and FDA entered into a Memorandum of Understanding in 1999 regarding inspection coordination in dual jurisdiction establishments. The MOU can be accessed at:

<http://www.fda.gov/oc/mous/domestic/225-99-2001.html> FSIS developed FSIS Directive 5730.1, Responsibilities in Dual Jurisdiction Establishments providing instruction to its inspection program personnel about their responsibilities in dual jurisdiction establishments. Establishments producing FDA and FSIS regulated products should consider the differences in regulatory requirements between the two agencies when designing their food safety systems. The following list of recommendations could be used by establishments to prevent postlethality exposed RTE meat and poultry products from becoming adulterated with LM. \u2022 Completely separate processing areas for FSIS regulated products and FDA regulated products, such as by complete wall separation, or scheduling processing on different days. If not possible, schedule FSIS product processing first, then FDA product processing. Always have a complete clean-up and sanitization after each processing and pre-op testing of equipment and processing environment before starting FSIS product processing. \u2022 FSIS and FDA product processing areas should each have separate equipment. If not possible, schedule to use equipment for FSIS product processing first, then for FDA processing.

9",\u2022 Assign different personnel to FSIS product and FDA processing areas, especially if both are conducted on the same day. If not possible, have personnel clean hands thoroughly, and use unused, clean coats, new gloves and hairnets, and sanitized boots for FSIS and FDA processing. \u2022 Maintain a list of FSIS and FDA products processed to avoid confusion. \u2022 Maintain the same sanitation procedures for LM in both FSIS and FDA processing to avoid LM cross-contamination or growth in the processing environment.

10"]},{"file\_name":"FSIS\_GD\_1999\_0002","title":"Packing Dates on Poultry Labeling","num":"FSIS-GD-1999-0002","id":"e7ef2d25080bebad737f0c38d629cc4830f221d7563e0283e882e8e132f01e63","corpus":"fsis\_guidelines","source\_page\_url":"https://www.fsis.usda.gov/policy/fsis-guidelines","url":"https://www.fsis.usda.gov/sites/default/files/media\_file/2021-07/FSIS-GD-1998-0002.pdf","type":"pdf","n\_pages":3,"word\_count":1129,"text\_by\_page":["April 8, 2008 Food Safety and Inspection Service (FSIS) Compliance Guide on the Determination of Processing Aids Purpose of the Compliance Guide The intent of this guidance is to convey FSIS\u2019 approach to determining whether an ingredient may be considered a processing aid. Processing aids do not have to be declared in the ingredients statement on the label of the meat or poultry food product in which they are used. Regulatory Requirements for Processing Aids Ingredients that are present in a meat or poultry product in an insignificant amount and that have no functional

or technical effects in the finished meat or poultry product are considered to be processing aids. Processing aids are not required to be listed in the ingredients statement for a meat or poultry product. Although the Federal meat and poultry inspection regulations do not define \u201cprocessing aid,\u201d FSIS, in evaluating whether a substance is a processing aid, uses the Food and Drug Administration\u2019s (FDA) definition of this term, which is in 21 CFR 101.100(a)(3). According to the FDA definition, processing aids are substances that have no technical or functional effect in a finished food but may be present in that food by having been used as ingredients of another food in which they had a technical effect. For example, sodium silicoaluminate will provide a technical effect as an anti-caking agent in a dry seasoning mix. However, once the seasoning mix is used in the formulation of a meat sausage, the sodium silicoaluminate will no longer provide a technical effect in the finished food (i.e., the sausage). Processing aids are defined as: (a) substances that are added during the processing of a food but are removed in some manner from the food before it is packaged in its finished form; (b) substances that are added to a food during processing, are converted into constituents normally present in the food, and do not significantly increase the amount of the constituents naturally found in the food; or (c) substances that are added to a food for their technical or functional effect in the processing but are present in the finished food at insignificant levels and do not have any technical or functional effect in that food. Whether a substance meets these conditions is determined by FSIS on a case-by-case basis by considering the proposed use of the substance and the specific meat or poultry product to which it is added. Self-determination by manufacturers that a substance is a processing aid is not acceptable. Data must be submitted to FSIS\u2019 Labeling and","April 8, 2008 Program Delivery Division (LPDD) to show that the proposed use of the substance is consistent with FDA\u2019s definition of a processing aid. Manufacturers may contact LPDD at (202) 205-0623 for guidance concerning what information needs to be submitted to support their assertion that a particular use of a substance in a meat or poultry product is a processing aid."}],{"file\_name":"FSIS\_GD\_1999\_0003","title":"Update - 416.2(g): Water supply and water, ice, and solution reuse","num":"FSIS-GD-1999-0003","id":"06d3c60c0a6d0c6e91676507de0e714d422b1103eed222f1a3d2ad5ed63addb3","corpus":"fsis\_guidelines","source\_page\_url":"https://www.fsis.usda.gov/policy/fsis-guidelines","url":"https://www.fsis.usda.gov/sites/default/files/import/san\_update1.pdf","type":"pdf","n\_pages":20,"word\_count":3662,"text\_by\_page":["April 8, 2008 Guidance on Meaning of \u201cProhibited Substances\u201d in FSIS Actions on the Use of Ingredients in Meat and Poultry Products Purpose of the Compliance Guide This document is intended to provide guidance on \u201cprohibited substances\u201d to interested parties who wish to use new food ingredients (hereafter referred to as \"substances\") in the manufacture of meat and poultry products. Prohibited Substances Title 9 of the Code of Federal Regulations (CFR), Section 424.23, specifically prohibits the use of any substance in or on any meat or poultry product if it conceals damage or inferiority, or makes the product appear to be better or of greater value than it is. One example of this would be the addition of paprika to ground beef or cuts of meat. While the use of paprika in some meat and poultry products is acceptable and expected (e.g., the use of paprika in chorizo, Italian sausage, or barbecued chicken), the addition of paprika to ground beef or cuts of meat is prohibited because it would impart a permanent color to the meat. The addition of paprika in this manner would misrepresent the leanness of the meat (e.g., making it appear to have less fat than a similar package of ground

beef or cut of beef without paprika). For this reason, 9 CFR 424.23 specifically prohibits the use of paprika or oleoresin paprika in or on fresh meat, such as steaks; on comminuted fresh meat, such as chopped and formed steaks or patties; or in any other meat consisting of fresh meat (with or without seasoning). The Food Safety and Inspection Service's (FSIS) regulation on prohibited substances covers any potential use of a substance that could be used to conceal damage or mislead consumers. FSIS considers 9 CFR 424.23 each time it evaluates the suitability of a new substance, or a new use of a previously approved substance, under the joint Food and Drug Administration (FDA) and FSIS ingredient approval process. Suitability relates to the effectiveness of the substance in performing the intended technical purpose of use, at the lowest level necessary, and the assurance that the conditions of use will not mislead consumers. For example, the use of preservatives (e.g., sorbic acid) are not permitted on fresh meat because their use could mask spoilage indicators (i.e., make spoiled meat appear fresh). Therefore, FSIS requires data to be submitted on the organoleptic properties (e.g., odor, taste, color and feel) of treated meat whenever the Agency is asked to evaluate a new use of a substance. While the new or expanded use of a substance may not require rulemaking under the joint FDA and FSIS approval process, rulemaking may be necessary where a standard of identity or other Federal regulation prohibits or limits the use of a substance. Currently, for example, potassium sorbate may be added only to dry sausages to retard mold growth. If the addition of potassium sorbate to ground beef is sought, rulemaking might be necessary to include that use.", "April 8, 2008 Ingredient Approval Background On December 23, 1999, FSIS published in the Federal Register (64 FR 72167) a final rule titled, "Food Ingredients and Sources of Radiation Listed or Approved for Use in the Production of Meat and Poultry Products." This final rule explained how FDA and FSIS will work together regarding future requests for approvals of substances to be used in or on meat and poultry products. The final rule streamlined the process for approving the use of substances in meat and poultry products by providing for the simultaneous review by FDA and FSIS of requests and petitions. A Memorandum of Understanding (MOU) was implemented in January 2000 that outlines the procedures for such reviews. The final rule and the MOU may be accessed through the FSIS Web Site at:

[http://www.fsis.usda.gov/Regulations\\_&\\_Policies/ingredients\\_guidance/index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/ingredients_guidance/index.asp) The Risk Management Division (RMD) and the Labeling and Program Delivery Division (LPDD) in the Office of Policy and Program Development (OPPD) serve as FSIS' key offices on the use and labeling of substances and on the implementation of the MOU with FDA on joint review and approval of substances. The Office of Food Additive Safety (OFAS) in the Center for Food Safety and Applied Nutrition (CFSAN) at FDA is responsible for leading that agency's regulation of food ingredients and additives, as well as for working collaboratively with FSIS in the implementation of the MOU. Additional Guidance Additional guidance on prohibited substances may be obtained from the Labeling and Program Delivery Division at (202) 205-0623."]}, {"file\_name": "FSIS\_GD\_2005\_0001", "title": "Compliance Guidelines for Retained Water", "num": "FSIS-GD-2005-0001", "id": "25f083e51fcb13201ae016b04a58dae8f9eca3ff7f938010063fe938538d7fe7", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Retained-water-guidance.pdf", "type": "pdf", "n\_pages": 18, "word\_count": 6291, "text\_by\_page": ["Questions and"]}

Answers FSIS DIRECTIVE 6100.4 VERIFICATON INSTRUCTIONS RELATED TO SPECIFIED RISK MATERIALS Note: FSIS Directive 6100.4 is arranged in chapters. The following Q&As are grouped according to the chapters where they most readily apply. Additional sections not specifically addressed in the directive are included. Chapter I: General Introduction I.

Identification of SRMs Chapter 2: Slaughter and Processing Verification Activities I. General verification activities (design and execution) for HACCP, SSOP, and PR programs II. Verification activities for age determination III. Post-mortem on-line verification duties IV. Verification of sanitation procedures V. Verification of SRM removal, segregation, and disposition; general recordkeeping VI. Verification activities for tonsil removal, segregation, and disposition VII. Verification activities for distal ileum removal, segregation, and disposition VIII. Disposal and rendering of SRMs IX. Verification activities for the prohibition of air-injection stunning X.

Verification activities for the prohibition of mechanically separated beef. Chapter 3:

Transportation of Carcasses and Parts that Contain SRMs I. Verification at slaughter establishments II. Verification at receiving establishments Chapter 4. Documentation and Enforcement I. Documentation II. Enforcement Chapter 5. Addendum: I. Handling of SRMs in custom plants 1", "Chapter 1 General Introduction Identification of SRMs Q1. What are Specified Risk Materials (SRMs)? A1. Per 9 CFR 310.22(a), except when derived from beef imported from countries that demonstrate their status to meet or exceed the food safety status in the USA having prohibited SRMs for use in human food, the following materials from cattle 30 months of age and older are SRMs: the brain, skull, eyes trigeminal ganglia, spinal cord, vertebral column (excluding the vertebrae of the tail, the transverse processes of the thoracic and lumbar vertebrae, and the wings of the sacrum) and dorsal root ganglia. SRMs also include the tonsils and distal ileum from cattle of all ages. Q2. Why does FSIS prohibit the use of SRMs for human food? A2. Scientific and epidemiological studies have linked the fatal human disease variant Creutzfeldt-Jacob Disease (vCJD) to exposure to BSE, most likely through human consumption of beef products contaminated with the BSE agent. The tissues designated as SRMs in 9 CFR 310.22(a) are those tissues that are known to contain the BSE agent in cattle infected with BSE, as well as materials that are closely associated with these potentially infective tissues. These materials may harbor the infectious agent before the animal shows any clinical signs of disease. Therefore, FSIS prohibits SRMs from use as human food to minimize potential human exposure to the BSE agent. Canada took similar actions when a single case of BSE was discovered there in May 2003. Q3. How will FSIS ensure that SRMs are not present in human food? A3. Per 9 CFR 310.22(e), slaughter and processing establishments are required to develop, implement, and maintain written procedures to ensure that SRMs are removed from the carcasses of cattle, segregated from edible product, and disposed of as inedible. To ensure that SRMs are not present in edible product, FSIS inspectors will verify that establishments are properly implementing their procedure for the removal, segregation, and disposition of SRMs. The vertebral column and the skull of cattle 30 months of age and older are SRMs and, as such, must be disposed of as inedible. Vertebral columns are also prohibited for use in AMR systems per 9 CFR 318.24. Q4. Must all SRMs be removed at the slaughter establishment? A4. Per 9 CFR 310.22(e), all SRMs must be removed before the product can leave the slaughter establishment except for the vertebral column from cattle 30 months and older. 9 CFR 310.22(g) permits slaughter establishments to ship carcasses or parts of carcasses that contain vertebral columns from cattle 30 months of age and older to another federally 2", "inspected facility for further

processing and removal if both establishments have controls in place to ensure that the SRM portions of the vertebral column are removed and properly disposed of by the processing establishment. For cattle, 9 CFR 310.22(c) specifically states spinal cord must be removed at the slaughter establishment. All SRMs must be removed before the carcass or parts can enter commerce. Q5. Regarding the diagram in FSIS Directive 6100.4, Page 22, Attachment 2, can you clarify what the circled area includes that should not be intended for food? A5. All tissues identified as SRMs in 9 CFR 310.22(a) are designated as inedible and not for human food. The circled area is a stylized representation demonstrating only the bony portion of the vertebral column prior to splitting that is not eligible for human food. It does not mean that all the muscle portions adjacent to the vertebral column (not shown) under the circled area must always also be removed. Chapter 2: Slaughter and Processing Verification Activities General Verification Duties (Design and execution) of HACCP, SSOP and PR Programs Q6. Can a processing establishment control SRMs through a prerequisite program? A6. Yes. Per 9 CFR 310.22(e), the removal, segregation, and disposal of SRMs may be addressed one of three ways under the HACCP system. Establishments may incorporate their procedures for the removal, segregation, and disposition of SRMs into a HACCP, SSOP, or other pre-requisite (PR) program. If the establishment determines in the hazard analysis that the hazard (of SRMs) is not reasonably likely to occur because of a SSOP or other PR program, the removal of SRMs is effected as part of the written SSOP or PR program. According to HACCP requirements in 9 CFR 417.2(a), if a plant determines in its hazard analysis that SRMs are a hazard reasonably likely to occur, control of the hazard by a CCP is required. Q7. Must processing establishments that use boneless beef (beef trimmings, ground beef, etc.) from other inspected facilities develop written procedures for the removal, segregation, and disposal of SRMs and reassess their HACCP programs? A7. Yes. Per 9 CFR 310.22(e) and 9 CFR 417.4(a)(3), all establishments that slaughter cattle and all establishments that process the carcasses or parts of cattle must reassess their HACCP plan and develop, implement, and maintain written procedures for the removal, segregation, and disposal of SRMs. 3", "Verification of Sanitation Procedures regarding SRMs Q8. May an establishment slaughter mixed aged groups of cattle (i.e., those containing animals less than 30 months of age and those 30 months of age or older) without segregating if they clean and sanitize equipment after they process cattle 30 months of age and older before they process cattle less than 30 months of age? A8. Yes. Under 9 CFR 310.22(f), if an establishment slaughters cattle and does not segregate the two age groups, the establishment must either: 1) use dedicated equipment to cut through SRMs or 2) clean and sanitize equipment after it comes in contact with SRMs from the cattle 30 months of age and older, and before it is used on cattle less than 30 months of age. Q9. When cleaning and sanitizing equipment between cattle of different age classes, what is required for equipment to be considered \u201ccleaned and sanitized\u201d? A9. Equipment that comes in contact with SRMs from cattle 30 months of age and older must be cleaned (i.e., washed to remove visible contamination) and then sanitized (i.e., 180\u00b0F degree water) before it can be used on carcasses or parts of carcasses from animals less than 30 months of age. Cleaning means the removal of organic debris that is adhering to the equipment prior to sanitization (this precludes the transfer of SRM to product from cattle less than 30 months of age). However, it is not expected that \u201cclean and sanitize\u201d would be taken to the preoperational state of cleanliness. Q10. Does the splitting saw blade housing area need to be opened and cleaned, or

is just dipping adequate? A10. The \u201cclean and sanitize\u201d procedure must be adequate to remove visible tissue residue and followed by sanitizing with 180\u00b0F water. If the plant can demonstrate the interior surfaces of the saw are maintained in a clean condition to be effectively sanitized by the 180\u00baF water without opening the saw door, it may be an acceptable procedure. Equipment need not be cleaned to a pre-operational state before sanitizing. Q11. When establishments slaughter cattle of mixed ages (both less than 30 months as well as 30 months and older) and slaughters the older and younger animals separately, what is the required intervention for cleaning the equipment (e.g., splitting saw) between animals? A11. All plants that slaughter cattle or process cattle carcasses or parts have the responsibility of developing, implementing, and maintaining written procedures for the removal, segregation, and disposition of Specified Risk Materials (SRMs). These procedures must be incorporated into the plant's HACCP plans, SSOPs, or other prerequisite program. 4", "Under 9 CFR 310.22(f), if an establishment segregates older (30 months and older) from younger (less than 30 months) cattle, and slaughters and processes the younger cattle first, the establishment may use routine operational sanitation procedures to prevent cross contamination of SRMs between all cattle 30 months and older. If cattle 30 months and older are slaughtered, all equipment should be cleaned and sanitized before slaughtering the younger animals to prevent cross-contamination of the edible portions of the carcasses and parts of younger cattle with SRMs from the older cattle. Q12. FSIS notice 7-04 directed that readily identifiable SRM contamination be removed from the carcass. However, for establishments that are splitting carcasses (down the vertebral column) from cattle 30 months of age and older, did the final rule change the requirements for dealing with vertebral bone dust? A12. The final rule does not change the agency\u2019s position on bone dust. The information in FSIS Notice 7-04 has been incorporated into FSIS Directive 6100.4 \u201cVerification Instructions Related to Specified Risk Materials,\u201d which became effective October 1, 2007. The Agency expects readily identifiable SRM material to be removed from the carcass; knife trimming is an accepted method. Q13. Our state inspection program has an establishment that does not identify or segregate carcasses according to age and treats all animals as 30 months and older. Its SSOP states that it will remove all SRMs as if the carcass and parts are from beef animals over 30 months. At what point would the inspector verify sanitation procedures for this establishment once it has removed the spinal column with the band saw? A13. If the establishment does not segregate between beef carcasses less than 30 months of age and carcasses equal to or greater than 30 months of age (in other words, treats all carcasses as 30 months and older), then normal or regular sanitation requirements are expected. Normal sanitation requirements require that any grossly identifiable SRM that can end up in the meat be removed as it is considered to be inedible contamination and not for human food. Since all carcasses are being processed on the processing floor as 30 months and older, then all tissues that are considered SRMs are removed and disposed of as inedible regardless of the age of the animal. Q14. Assuming that the spinal cord has been properly removed by the slaughter establishment, is it permissible for the vertebral column of a carcass or sub-primal, i.e., chuck, to come in contact with edible tissue from another carcass or subprimal? A14. Contamination of meat or meat products by SRMs is based on identification of readily or grossly identifiable (e.g. a piece of spinal cord) SRM tissue. No further action is required so long as the plant has implemented all procedures it deems necessary to prevent potential contamination of meat by readily identifiable SRMs. 5", "Note:

Be aware that additional requirements may apply if the plant is participating in an AMS Export Verification (EV) program. Also, other monitoring, verification, record keeping, or corrective actions may apply depending on how the plant addresses SRMs under the HACCP umbrella (HACCP, SSOP, or PR programs). Q15. Is it permissible to bone a chuck on a table given that the vertebral column will come into contact with food contact surfaces, i.e.. conveyor belts and cutting boards? A15. Yes, the vertebral column may touch food contact surfaces provided the plant has implemented procedures to prevent cross contamination of meat with readily identifiable SRMs. For example, the plant may include in their written SRM control procedures (HACCP, SSOP, or PR program) employees will monitor the spinal cord has been completely removed from each vertebral column of each carcass quarter prior to dropping on the table for breaking. Q16. Is a knife used to cut through SRM material considered contaminated? A16. A knife used to cut through SRMs is a potential source of contamination. FSIS expects the plant to implement whatever procedures it deems necessary to prevent the contamination of meat with SRMs. Any knives used to split SRMs, specifically vertebral columns from cattle 30 months and older, must be cleaned and sanitized before being used on carcasses or products of cattle less than 30 months of age unless the establishment uses dedicated equipment to cut through SRMs. See 9 CFR 310.22(f). Q17. How would FSIS personnel verify that water being re-cycled in a carcass wash cabinet or steam pasteurization cabinet is free of SRM? A17: In operations that utilize re-cycled water in carcass wash cabinets and steam pasteurization cabinets, FSIS personnel would periodically verify that carcasses are washed free of visible bone remnants before the carcass enters the wash cabinet or steam pasteurization cabinet. In addition, FSIS personnel would ensure that the water being recycled is being filtered in accordance with the standard for reuse of water in 9 CFR 416.2(g)(3) to remove any build-up of biological material.

Post-mortem On-Line Verification Activities Q18. Can an establishment collect spinal cord for sale for edible product for human consumption from cattle younger than 30 months of age? A18. Spinal cord material from cattle younger than 30 months of age is not a specified risk material as listed in 9 CFR 310.22. There is no regulation that prohibits an establishment from harvesting spinal cord from cattle younger than 30 months of age for human consumption, provided it is wholesome, unadulterated, and properly labeled. However, 9 CFR 318.6(b)(4) limits the manner in which spinal cord may be used for human food. 9 CFR 318.6(b)(4) provides:

6","(4) On account of the invariable presence of bone splinters, detached spinal cords shall not be used in the preparation of edible product other than for rendering where they constitute a suitable raw material. Detached spinal cords from cattle 30 months of age and older shall not be used as raw materials for edible rendering. Verification of SRM Removal, Segregation, and Disposition; General Recordkeeping Q19. How much of the back bone or vertebral column from cattle 30 months and older needs to be removed? A19. Per 9 CFR 310.22(a) and (c), before beef product can enter commerce outside a federal establishment, the entire vertebral column (back bone) has to be removed except for the vertebrae of the tail, the transverse processes of the thoracic and lumbar vertebrae, and the wings of the sacrum. The cuts are just beyond both sides of the back bone. This cut will not be through the vertebrae themselves but will go through the transverse processes and ribs. See the two diagrams in Attachment 2 of FSIS Directive 6,100.4 that illustrate transverse processes and ribs in relation to the vertebrae. Q20. If the establishment is removing the meat from around the vertebral column with electric ("wizard\") knives, is this a potential problem when used around the transverse processes of

the thoracic and transverse vertebrae? A20. Based on the diagram in Attachment 2 of FSIS Directive 6100.4, the use of a wizard knife above the transverse processes (non-SRM) appears to be of little risk. The use of a wizard knife below the transverse process of the lumbar vertebrae may be of greater risk. The regulations require each plant to develop effective procedures for the removal, segregation, and disposal of SRMs. It is up to the plant to develop, implement, and maintain written procedures for the removal, segregation, and disposition of SRMs. These procedures must be incorporated into the plant's HACCP plans, SSOPs, or other pre-requisite program. Q21. Can I cut steaks from the loins of cattle 30 months of age or older first and then remove the SRMs associated with the vertebral column? A21. No. Plants are expected to develop procedures in the HACCP plan, SSOP or other pre-requisite program that ensure the effective removal of all SRMs and ensure that SRMs do not contaminate edible product. FSIS has determined that the removal of SRMs from cut steaks increases the potential for contamination of edible tissue with SRMs and presents an unacceptable and unnecessary risk to consumers. Q22. Are very small plants that address SRM removal, segregation and disposition in a prerequisite program (or SSOPs) required to keep daily records

7", "documenting monitoring, verification, recordkeeping and corrective actions, including reassessment? A22. Yes. In the case of SRMs, 9 CFR 310.22 has specific recordkeeping requirements that apply regardless of whether the establishment addresses its procedures for the removal of SRMs in its HACCP plant, SSOP, or other prerequisite program. Records are only required for the days when the plant is in operation and producing product that has SRM tissues. If the establishment chooses to address SRMs in a prerequisite program, then that prerequisite program must meet all the requirements of 9 CFR 310.22 that specify daily recordkeeping. Verification Activities for Tonsil Removal, Segregation and Disposal Q23. How do FSIS inspectors verify that 5 mm of tissue is removed from tongues to ensure removal of lingual tonsils? A23. Inspection program personnel should verify that the establishment has appropriately addressed the use of a skinning machine through verifiable equipment settings and procedures so that a minimum of 5mm, or more, of tissue is removed, and that visible tonsillar tissue (i.e., the SRM) does not remain on the blade or any part of the skinning machine in a manner that may cross-contaminate edible product with SRM material. Q24. In addition to boneless beef, the plant saves head meat and tongues. The rest of the head is condemned. The plant identifies various SRMs except for tonsils. Does the plant need to address removal of tonsils in its hazard analysis? A24. Yes. Tonsils are a SRM in cattle of all ages. The establishment must consider all SRMs in their hazard analysis. SRM hazards should be addressed in the HACCP, SSOP, or PR program. Since tonsils are SRMs, the establishment must remove the tonsils from the edible tongue tissue and address tonsil removal in their written procedures as described in 9 CFR 310.22(e). Verification Activities for the Prohibition of Air-Injection Stunning Q25. The regulations prohibit the use of stunning devices that inject air into the cranial cavity of cattle. Does this include stunning devices which merely use air to power the bolt (as with the more common explosive charge bolt stunners) and may incidentally inject air? A25. No. The regulations do not specifically prohibit pneumatic stunning devices. 9 CFR 310.13(a)(2)(iv)(C) prohibits the use pneumatic stunning devices that inject compressed air into bovine skulls during stunning. This regulation would apply to malfunctioning captive bolt stunners that use compressed air. 9 CFR 313.15(b) specifically prohibits the use on cattle of captive bolt stunning devices that deliberately inject air into the cranial cavity at the end of the penetration cycle.

8", "Verification of Disposal and Rendering of SRMs Q26. What are the record keeping requirements for disposal of SRMs to inedible rendering? Specifically, do we need a separate vertebral column weight with the rendering company providing a record stating that a given weight of SRMs were received and subjected to inedible rendering, or can the establishment maintain a weight ticket for the weight of all bones received and subjected to inedible rendering? A26. Plants are required to maintain daily records sufficient to document the implementation and monitoring of their procedures for the removal, segregation, and disposition of SRMs. Plant records must demonstrate that the plant is following its procedures to remove and dispose of SRMs per 9 CFR 310.22(c) and 310.22(e)(4). Plant records may show separate specific weights of SRMs, but they are not required to do so. The records of plants that receive product with SRMs must show that the SRMs in the specific product have been removed and disposed of per 9 CFR 310.22(g)(4). (4) Maintains records that verify that the official establishment that received the carcasses or parts removed the portions of the vertebral column designated as specified risk materials in paragraph (a)(1) of this section and disposed of them in accordance with Sec. 314.1 or Sec. 314.3 of this subchapter. Q27. Can SRMs be rendered or must they be sent to an approved landfill? A27. SRMs from any bovine that passes AM inspection may be sent to inedible rendering or disposed of in an approved landfill after denaturing as per 9 CFR 314.1 or 314.3. SRMs are not restricted from being rendered unless the animal was condemned by FSIS on AM and samples were collected on-site and are being tested for BSE. When any condemned carcass is being tested on-site for the presence of BSE, FSIS inspection personnel should request that the any part of the carcass or SRMs not go into inedible rendering until a negative BSE result is obtained. Any carcasses or parts from condemned animals that are being tested for BSE may be disposed of in a lined landfill or incinerated in accordance with state or local sanitary codes when a test result has not yet been received. The establishment must maintain accurate records documenting the location of carcass or parts disposal. Chapter 3: Transportation of Carcasses and Parts that Contain SRMs A. Verification at Slaughter Establishments B. Verification at Receiving Establishments Verification at Slaughter (Shipping) Establishments 9", "Q28. Is the shipping establishment required to provide documentation with every shipment? A28. The shipping establishment must include in its hazard analysis decisions on food safety hazards that can occur before, during, and after entry into the establishment. The shipping establishment can ship bone-in product with SRMs (e.g., vertebral columns) as long as it verifies their removal by the receiving establishment. In addition, the shipping establishment must provide documentation to account for all product on every shipment of product containing SRMs (e.g., vertebral columns from cattle 30 months and older) to the receiving establishment. Q29. If the shipping establishment is shipping only boneless product or is removing all SRMs, is there a need to certify every shipment? A29. No. If the establishment is shipping only boneless product or bone-in products from cattle under 30 months, it should provide adequate documentation to the receiving establishment that verifies its SRM control programs are on-going and still in effect. The plant need not necessarily provide such documentation for each shipment. See Question 27 and 37. Q30. Are there any specific requirements for the use of company seals, as described in prior notices dealing with SRMs or FSIS Directive 6100.4? For example, can they simply use a padlock to seal the trailer in transport with specified risk materials (SRMs) on board? A30. The plant is responsible for developing its own controls. Such controls should be effective and may include the use of company seals or

padlocks. The use of a padlock alone does not provide adequate control unless it can be demonstrated that the identity of the product is maintained, or the shipment cannot be opened during transit before reaching the receiving official establishment. Inspection personnel are to ensure that the method of control is equivalent to use of tamper-evident seals and does not allow diversion for other purposes. Any unloading of the controlled products without the knowledge of the establishment, and without providing clear evidence (allowing FSIS verification) that control has been maintained, would not be considered adequate. Q31. FSIS Directive 6100.4 clarifies that beef carcasses from cattle 30 months of age and older can be shipped with vertebral columns still in. Can these carcasses be shipped with spinal cord still present within the vertebral column? These carcasses are shipped split, but there are often mis-splits where the spinal cord is still present. A31. No. 9 CFR 310.22(c) states the following: the spinal cord from cattle 30 months of age and older must be removed from the carcass at the establishment where the animal was slaughtered. 10", "Q32. EST A slaughters cattle and provides carcasses containing the vertebral column to EST B, located in the next town. EST B transports the carcasses from EST A to EST B in a transport vehicle owned and controlled by EST B. The carcasses are further processed at EST B. The Public Health Veterinarian is satisfied that both EST A and EST B have documentation to demonstrate that all carcasses leaving EST A arrive at EST B, and that EST B removes and disposes of all SRM. Based on this, is the establishment required to use company seals? A32. The regulations specify plants must be able to demonstrate \u201ccontrol\u201d of SRMs. The use of company seals is only one of several means to control SRMs. If the establishment has developed an alternative means to maintain control of the adulterated products, the use of company seals is not specifically required. Inspection personnel are to ensure that the method of control is equivalent to use of tamper-evident seals, does not allow diversion for other purposes or unloading of the controlled products without the knowledge of the establishment, and provides clear evidence (allowing FSIS verification) that control has been maintained. Q33: How specific must the records be to verify that the receiving establishment removed and properly disposed of the SRMs? Does the shipping establishment need to receive specific records for each carcass, part, load, etc, or would a blanket letter from the receiving establishment expressing their intent to remove the SRMs be appropriate? A33. Yes. Blanket letters are not an acceptable means to verify removal and disposal of SRMs in bone-in or other products with SRMs by the receiving plant since they typically do not contain specific identifying information. The shipping establishment must have records that demonstrate that the receiving establishment removed and properly disposed of the SRMs from specific products through lot numbers, dates, or other specific product identifying information. Q34. Previously, we used a blanket letter from the receiving plant to document that all SRMs were removed. If a blanket letter that accompanies each shipment of beef products with SRM is no longer acceptable, what information must be included? A34. By blanket letter, we presume you mean a letter of guarantee without specific information identifying the product or shipment. Per 9 CFR 310.22(e)(4), plants are required to maintain daily records sufficient to document the implementation and monitoring of their procedures for the removal, segregation, and disposition of SRMs. Establishments that transport carcasses or parts from cattle 30 months of age and older for further processing will have to obtain these records from the receiving establishment in order to verify that the receiving establishment removed and properly disposed of the SRMs. Records that document the removal of SRMs at

the receiving plant need to identify the specific product. Examples of records that might identify specific product containing SRMs requiring removal may include some or all of the following: 1. date shipped, load number 11","2. date arrived, 3. purchase order (PO) number, 4. product description; number of carcasses\parts, lot number 5. date\shift when processed or SRMs removed 6. product description indicating removal and disposal of SRMs meets requirements in 9 CFR 310.22 and 9 CFR 314. Q35. Is the mark of inspection applied to carcasses from cattle 30 months and older with vertebral columns intact at the shipping facility or only after removal of SRMs? A35. In the preamble discussion of the final SRM rule in Federal Register, Vol. 72, No. 134, July 13, 2007, FSIS announced, \u201clf establishments have implemented appropriate controls, FSIS inspection personnel at the shipping establishment will apply the mark of inspection to carcasses or parts that contain SRM vertebral bones as an accommodation to facilitate their transport to a processing facility where the SRMs can be removed and properly disposed of.\u201d Verification at Receiving Plants Q36. Is it permissible to break the company seal and off-load other products (other than parts which contain vertebral columns) prior to arriving at the final destination with the parts which contain SRMs? A36. Plants need not utilize company seals provided they can implement other controls to maintain identity of product and ensure the effective removal of all SRMs from the specific product before that enters commerce. Q37. Must a receiving establishment have certification from the shipping establishment if it is receiving bone-in products? A37. Each establishment that receives bone-in product must consider what steps, if any, are necessary to ensure that the supplier has properly identified SRMs, if present, for removal or that the product does not contain SRMs because it is from an animal that was younger than 30 months at the time of slaughter. Without adequate supplier documentation demonstrating the on-going identification, segregation, and removal of all SRMs, the products with vertebral column will be deemed from cattle 30 months and older per 9 CFR 310.22(h) and require removal. A prudent establishment may incorporate additional procedures or programs that include purchase specifications or supplier certification. Daily records are required. 9 CFR 310.22(e)(4) states: (4) Recordkeeping requirements. (i) Establishments that slaughter cattle and establishments that process the carcasses or parts of cattle must maintain daily records sufficient to document the implementation and monitoring of the procedures for the removal, segregation, and disposition of the materials listed in paragraph (a) of this section, and any corrective actions taken.

12","Q38. Must a receiving establishment have certification from the shipping establishment if it is receiving only boneless beef products? A38. Plants that only receive only boneless-beef must reassess their hazard analysis for SRMs in their process. Written procedures are not required if the plant determines and can support that SRMs are not a hazard likely to occur in its process. The use of general documentation (e.g., \u201cblanket\u201d letters of guarantee) identifying shipment of only beef products from cattle less than 30 months of age is acceptable here. The written hazard analysis and supporting documentation from the shipping establishment attesting to origin of beef from cattle less than 30 months of age or the complete removal of SRMs in the boneless beef products shipped satisfy the requirements in 9 CFR 310.22(e) and 9 CFR 310.22(h). See Questions 27 and 30. Q39. Assuming that the receiving processing establishment must account for all bone-in beef with (SRM) vertebral column received as identified on the purchase order (PO), and knowing the receiving establishment may take over two days to bone all the product on the purchase order, must the record

verifying that the receiving establishment handled the SRMs correctly be generated after the entire PO is fabricated? A39. Not necessarily. Plants are required to maintain daily records sufficient to document the implementation and monitoring of their procedures for the removal, segregation, and disposition of SRMs. A plant may be able to subdivide lots and produce a record for a partial lot provided the plant can ultimately account for all product listed on a single purchase order (PO). Q40. FSIS permits establishments to transport carcasses that contain vertebral columns from cattle 30 months of age and older (SRMs) to another official establishment. Can an establishment that is inspected under a participating state meat program be the recipient of such carcasses? A40. No. Beef products containing SRMs can not move from a federal establishment to a state-inspected establishment. Such products moving from an establishment under Federal inspection to a plant under a non-Federal inspection system are considered to be in commerce. Beef products containing specified risk material (e.g., vertebral column) are not permitted to move unrestricted in commerce. Addendum Handling of SRMs in Custom Plants Q41. Do the SRM regulations apply to custom slaughter? 13", "A41. Yes. By authority of the FMIA, the Secretary has designated SRMs as inedible and are not eligible for human food. This rule applies to custom as well as inspected animals and products. Q42. Can cattle be farm slaughtered and processed in custom facilities? A42. Only cattle that are healthy, wholesome, and ambulatory (not non-ambulatory disabled) can be farm slaughtered and processed at a custom processing facility. Q43. If a federally inspected establishment has a non-ambulatory disabled cow that it mistakenly or inappropriately intends to slaughter as \"custom exempt,\" should the on-site FSIS inspector segregate it and call a PHV so it can be condemned? A43. If the federally inspected establishment is preparing to custom slaughter a nonambulatory disabled cow (cattle) at a federally inspected establishment, then the animal should be controlled by the inspector using a suitable retain tag with a FSIS padlock (if necessary) until the PHV can condemn it. If the animal has not been presented for inspection and could possibly be removed from the premises without FSIS permission, and there is reason to believe it will be taken elsewhere for slaughter, FSIS inspection program personnel should promptly identify the animal as \u201cUS Inspected and Condemned,\u201d retain it in a pen using a US Retained Tag and a FSIS padlock, if necessary, and notify the PHV, FLS, and District Office (DO). If the establishment is non-federally inspected custom-exempt only operation, the reviewing officer should contact the OPEER via the DO for assistance. Q44. Are custom operations eligible to process cattle 30 months of age and older? A44. Yes, custom operations are allowed to slaughter and process cattle 30 months of age or older, provided they remove and handle the SRMs appropriately as required by 9 CFR 310.22. The SRMs listed in 9 CFR 310.22(a) will be considered to be from cattle 30 months of age or older unless the custom operator can demonstrate that they are from cattle under 30 months of age as stated in 9 CFR 310.22(h). Q45. Can a plant keep custom SRM records in the same records used for SRMs under inspection? A45. Yes. Custom establishments may keep custom records with records for activities that are under federal inspection provided that they are clearly identified as custom records. Q46. Are custom exempt operators required to have written procedures for the removal, segregation and disposition of SRMs and associated records and to keep records as described in 9 CFR 310.22(e)(4)? 14", "A46. No. FSIS does not require custom operator to keep records documenting written procedures describing the removal, segregation, and disposal of SRMs for federally inspected establishments per 9 CFR 310.22(e)(4), unless the custom

operation is subject to all of 9 CFR 416 and uses SSOPs to document removal, segregation, and disposal in inspected beef. Q47. What are the minimum recordkeeping requirements regarding SRMs for custom operations? A47. 9 CFR 303.1(b)(3) describes recordkeeping requirements for custom operators. To facilitate identification of SRMs, FSIS Directive 5930.1, based on 9 CFR Part 320, states that custom operations must keep records that document the following: 1) cattle slaughtered or processed are less than 30 months of age; 2) cattle are ambulatory at time of slaughter per 9 CFR 310.22(h). Custom operations that fail to document the age of cattle slaughtered or processed and the ambulatory status of animals at slaughter are expected to handle the carcass as 30 months and older and remove all SRMs. Be aware custom operations conducted in official establishments are subject to all of 9 CFR Part 16 including SSOPs per 9 CFR 303.1(a)(2)(i). If the official establishment includes its written procedure to remove, segregate, and dispose of SRMs in its SSOP, it must meet all the requirements of 9 CFR 416, including SSOP recordkeeping for its custom operations. Q48. Can T-bones, brains, etc. be saved from older animals (30 months and older) in custom exempt facilities? A48. No. SRMs from custom slaughtered or processed animals are considered adulterated and ineligible for use as human food. All SRMs must be removed before delivering the product to the owner.

This guide will help importers comply with the requirements for bringing these products into the United States. Importers that do not follow this guide may not be able to get products of this type into the United States.

Background The Food Safety and Inspection Service (FSIS) regulates meat, poultry, and processed egg products under statutory authority of the Federal Meat Inspection Act (FMIA), the Poultry Products Inspection Act (PPIA), and the Egg Products Inspection Act (EPIA). Recent food safety incidents involving what are traditionally considered low-risk food products, including the intentional contamination of powdered milk with melamine distributed worldwide, means that FSIS must be vigilant to protect American consumers by ensuring the safety of all products under its jurisdiction. Under the FMIA, PPIA and the EPIA, those attempting to import food products into the U.S. that contain meat, poultry, or egg product ingredients must ensure that these ingredients are from an approved source. To be from an

approved source, the meat, poultry, or egg product ingredient must have been prepared under FSIS inspection or under a foreign inspection system that has been found to be equivalent by FSIS. FSIS has recently discovered that, for various reasons, products containing small amounts of cooked meat or poultry ingredients have entered the country without an assurance that the products are from an approved source. Beginning on June 22, 2009, importers of food products that contain small amounts of meat or poultry will not be granted an import permit by the USDA Animal and Plant Health Inspection Service (APHIS) unless a determination is first made by FSIS that the meat, poultry, or egg product ingredient was prepared under specific conditions that will ensure that these ingredients are not adulterated. Once the determination has been made, food products that contain only a small amount of a meat, poultry, or egg product ingredient are no longer subject to the jurisdiction of FSIS and are then subject to the jurisdiction of the Food and Drug Administration." , "4 Import Permit Overview This guide has been prepared to inform you about how products containing very small amounts of meat, poultry, or processed egg products will be treated when offered for import to the United States. The meat, poultry, or egg product ingredient has always needed to come from an approved source. FSIS, however, has always played a secondary role to the U.S. Department of Homeland Security\u2019s Customs and Border Protection and the U.S. Department of Agriculture\u2019s APHIS in ensuring that this is the case. Recent developments have pointed to a problem with this approach. Beginning on June 22, 2009, FSIS will play a direct role in verifying that product comes from an approved source. This guide is designed to help you understand what FSIS will be looking for in the way of documentation of the source of the meat or poultry product ingredient, and how the process for importing your products to the United States will be affected by FSIS involvement. Beginning on June 22, the following two steps will apply to product containing a small amount of meat or poultry products.

1. The meat or poultry ingredient must originate from an approved source, i.e., must be prepared under FSIS inspection or prepared in a certified establishment in an equivalent foreign inspection system.
2. APHIS restricts some products from entering the United States because of animal disease conditions in the country of origin. Therefore, it will continue to be necessary to contact the APHIS Veterinary Services, National Center for Import and Export, for information on restrictions related to animal diseases and to obtain a permit from APHIS. APHIS regulates imports under statutory authority of the Animal Health Protection Act to ensure that they do not pose a risk to U.S. animal health, and issues a veterinary permit to import meat, poultry, or processed egg products into the United States. An application is made through USDA VS Form 16-3. There are some countries that have no animal disease concerns and therefore do not require an APHIS permit. Nevertheless the product must still originate from equivalent countries and establishments certified to export to the United States. For those products for which a new permit is being sought after June 22, APHIS will not approve the permit until the importer provides assurance for food products that contain a small amount of meat or poultry that the meat or poultry ingredient was produced from an approved source (i.e., prepared under either FSIS inspection in the United States or from a certified establishment from a country approved as having a system equivalent to that of the United States). If documentation can be provided that the meat or poultry ingredient included in a food product comes from an approved source, it can be imported to the United States. APHIS will issue permits for these types of products once FSIS determines that the conditions for import are met. Although some

food products containing a small amount of meat, poultry, or processed egg product ingredient may not pose a threat to animal health, and would be approved for an APHIS-issued veterinary permit (VS Form 16-6A), they may", "5 still not be approved for entry into the United States because these ingredients were not prepared under inspection systems designed to ensure that these ingredients are not adulterated. In other words, they may meet APHIS entry requirements but not meet FSIS entry requirements. While a permit may have been issued based on an attestation by the importer of an approved source of the meat or poultry ingredient, it is still the responsibility of the importer to possess documentation for every shipment of product. FSIS will continue to seek and detain imported products that contain a small amount of meat or poultry ingredient from non-approved sources that have entered the United States. This has been and will continue to be FSIS\u2019 enforcement strategy. How We Will Proceed A transition period of 90 days that began on March 19, 2009, and will extend until June 22, 2009, is being provided before instituting the new import permit application procedure. During this 90-day period, APHIS will provide a 90-day extension for any currently expired import permits, and permits that expire before June 22, 2009, without modification of the current APHIS permit language referencing the need to consult with FSIS regarding compliance with regulatory requirements. After June 22, 2009, importers must be able to provide documented evidence to support the origin of the meat and\or poultry ingredient used in the food product before the APHIS permit is issued. Also after June 22, 2009, in accordance with normal surveillance procedures of product that has entered the United States (for both products that require APHIS permits and products that do not require an APHIS veterinary permit), the importer will need to provide upon request documentation to demonstrate that the meat or poultry ingredient used in the specific product was derived from an approved source. Beginning on June 23, 2009, which is after the 90-day extension granted by APHIS, APHIS will forward the permit application, VS Form 16-3, to FSIS to verify that the meat or poultry ingredient is from an approved source. FSIS will review the application and work with the applicant to ensure that the applicant fully understands what documentation is needed. It is the applicant\u2019s responsibility to provide documented evidence of an approved source to FSIS. The APHIS system allows supporting documentation to be attached. The applicant may save time in the application process by submitting the proper documentation at the time application for a permit is made. As stated above, FSIS will review the documentation and verify that the meat or poultry food product ingredients originated from an approved source. If importers can provide documented evidence that the meat or poultry ingredient included in a food product comes from an approved source, it can be imported into the United States, regardless of the equivalency status of the country producing or exporting the final product. If this condition is not met, the imported food", "6 will not be considered approved for importation into U.S. commerce, and APHIS will deny approval of the permit. Questions may be directed to FSIS at permits@fsis.usda.gov or at (888)-287-7194. Supporting Documentation The importer will be expected to attest to FSIS that the meat or poultry product ingredient is from an approved source. To do so, the importer will need to support the attestation with evidence that the meat or poultry product ingredient came under FSIS inspection or from a certified establishment in an equivalent country. The documentation used to provide this support can take various forms. An importer may provide a bill of lading, an invoice from the producing establishment, or a statement to this effect from a government agency in the country in which

the ingredient originated or the finished product originated. At a minimum, however, the documents will need to provide a basis for determining: \u2022 The country of origin of the meat or poultry product ingredient, and \u2022 The establishment where the meat or poultry product ingredient was processed In addition, if the importer has applied for an APHIS permit, the valid APHIS Permit Application Reference Number needs to be referenced on all supporting documentation. FSIS provides additional examples of the types of documents that may be used to demonstrate that a product is from an approved source in the Appendix. Once again, if there are any questions regarding the type of documentation needed, please contact FSIS at permits@fsis.usda.gov or at (888)-287-7194. How to Apply for an APHIS Permit Importers may apply for an APHIS import permit by completing and submitting the permit application (VS Form 16-3) to APHIS. The application form may be found on the APHIS Web site at <http://www.aphis.usda.gov/>. Importers may complete the application manually by downloading and faxing the form to (301) 734-8226. The application may also be completed and submitted via ePermits. ePermits is a Web-based system that allows users to apply for a permit online, check the status of the application, view issued permits or other responses, and more. It uses a USDA-wide system for login called USDA eAuthentication. To use ePermits for most application permit types, you will need to register for an eAuthentication account with Level 2 access. For more information, go to the \u201cRegister to Use ePermits\u201d page at <http://www.eauth.egov.usda.gov/eauthCreateAccount.html>.,"7 VS import permit applications, VS Form 16-3, may also be obtained by writing to the Import\Export Animal Products Program at: USDA, APHIS, VS National Center for Import and Export Products Program 4700 River Road, Unit 40 Riverdale, MD 20737-1231 For further information or questions concerning import applications, contact the Animal Products Program at (301) 734-3277 or by facsimile at (301) 734-8226. User fees are charged for all import services for restricted animal products. All applications for a veterinary permit to import materials or transport organisms and vectors must be accompanied by payment before processing can begin. Acceptable methods of payment are: check, money order (payable to USDA, APHIS), VISA, MasterCard, American Express, or an APHIS User Fee Credit Account. User fee credit accounts are recommended if there are more than six fee activities per year. To establish a User Fee Credit Account, you will need to complete a User Fee Credit Application. You can obtain the User Fee Credit Application online; by telephone: (877) 777-2128 (U.S. and Canada only) or (612) 370-2291 (User Fee Help Line); or by writing to USDA, Marketing and Regulatory Programs-Business Services, Minneapolis Business Site, Accounts Receivable Team, P.O. Box 3334, Minneapolis, MN 55403. Next Steps For products containing processed egg products as ingredients, FSIS expects to not implement procedures for several months due to the more complicated process of ascertaining whether processed eggs or shell eggs are used in the food products. For the next 12-18 months, FSIS will conduct outreach to importers, manufacturers of products containing small amounts of meat and poultry ingredients, industry associations, and other interested parties. FSIS also intends to evaluate trade impacts and publish a Federal Register document that will solicit public comments with respect to the requirement that importers shipping food products to the United States that contain small amounts of meat, poultry, or processed egg ingredients ensure that these ingredients are from an approved source, produced under sanitary conditions, and in a secure environment."8 Appendix", "9 Examples of Supporting Documentation The following are some examples of the documentation that importers will

need to submit to FSIS and APHIS.", "10 A Product Formulation May Be Used to Provide Evidence of the Proportion of Meat, Poultry, or Processed Egg Product Ingredients in the Product Formulation", "", "11 An Export Certificate or a Health Certificate May Be Used to Identify the Country of Origin of Meat, Poultry, or Processed Egg Product Ingredients and to Identify the Establishment Where the Meat, Poultry, or Processed Egg Product Ingredients Were Processed", "", "", "", "", "", "", "", "", "", "", "", "12 A Product Label May Be Used to Provide Evidence that the Product Labeling Does Not Represent the Finished Product as a Meat Food Product, Poultry Food Product, or Egg Product", "", "13 Selected Sections of FSIS Statutes Poultry Products Inspection Act Title 21 of the United States Code, Section 453 (21 U.S.C. 453) Sec. 453. Definitions (f) The term \"poultry product\" means any poultry carcass, or part thereof; or any product which is made wholly or in part from any poultry carcass or part thereof, excepting products which contain poultry ingredients only in a relatively small proportion or historically have not been considered by consumers as products of the poultry food industry, and which are exempted by the Secretary from definition as a poultry product under such conditions as the Secretary may prescribe to assure that the poultry ingredients in such products are not adulterated and that such products are not represented as poultry products. Federal Meat Inspection Act Title 21 of the United States Code, Section 601 (21 U.S.C. 601) \u00a7601. Definitions (j) The term \"meat food product\" means any product capable of use as human food which is made wholly or in part from any meat or other portion of the carcass of any cattle, sheep, swine, or goats, excepting products which contain meat or other portions of such carcasses only in a relatively small proportion or historically have not been considered by consumers as products of the meat food industry, and which are exempted from definition as a meat food product by the Secretary under such conditions as he may prescribe to assure that the meat or other portions of such carcasses contained in such product are not adulterated and that such products are not represented as meat food products. This term as applied to food products of equines shall have a meaning comparable to that provided in this paragraph with respect to cattle, sheep, swine, and goats. Egg Products Inspection Act Title 21 of the United States Code, Section 1033 (21 U.S.C. 1033) \u00a71033. Definitions (f) The term \"egg product\" means any dried, frozen, or liquid eggs, with or without added ingredients, excepting products which contain eggs only in a relatively small proportion or historically have not been, in the judgment of the Secretary, considered by consumers as products of the egg food industry, and which may be exempted by the Secretary under such conditions as he may prescribe to assure that the egg ingredients are not adulterated and such products are not represented as processed egg products. Links to the Federal Meat Inspection Act, the Poultry Products Inspection Act, and the Egg Products Inspection Act may be found on the FSIS Web site at

[http://www.fsis.usda.gov/regulations\\_&\\_policies/acts\\_&\\_authorizing\\_statutes/index.asp](http://www.fsis.usda.gov/regulations_&_policies/acts_&_authorizing_statutes/index.asp)", "14 Notice of Enforcement by the USDA, FSIS, Regarding Imported Food Products Containing a Small Amount of Meat, Poultry, or Processed Egg Product Ingredients", "Notice of Enforcement by the United States Department of Agriculture, Food Safety and Inspection Service Regarding Imported Food Products Containing a Small Amount of Meat, Poultry, or Processed Egg Product Ingredients The Food Safety and Inspection Service (FSIS) regulates domestic and imported meat, poultry, and egg products under statutory authority of the Federal Meat Inspection Act (FMIA), the Poultry Products Inspection Act (PPIA), and the Egg Products Inspection Act (EPIA).

All food products for human consumption made using a small amount of meat, poultry or processed egg product ingredients for which these ingredients were not prepared under the U.S. inspection system or a certified establishment from an approved foreign food regulatory system are not eligible to enter the United States. USDA\U2019s Animal and Plant Health Inspection Service (APHIS) regulates imports of products of animal origin under statutory authority of the Animal Health Protection Act (AHPA) to ensure they do not pose a risk to U.S. animal health. Although some food products containing a small amount of meat, poultry, or processed egg product ingredient may not pose a threat to animal health and would be eligible for an APHIS-issued permit (VS Form 16-6A), they may remain ineligible for entry into the United States because these ingredients were not prepared under inspection systems designed to ensure that these ingredients are not adulterated. While FSIS statutes provide authority to exempt certain foods containing relatively small amounts of meat, poultry or processed egg product ingredients from FSIS inspection, FSIS must ensure that these ingredients are not adulterated. Accordingly, the meat, poultry, and\or processed egg product ingredient(s) used in FSIS-exempted products must be prepared under USDA\FSIS inspection or under a foreign inspection system approved by FSIS. A list of countries eligible to export meat, poultry or egg products to the United States (i.e., amenable food products generally composed of more than a small amount of meat or, poultry, or processed egg product ingredient, or is represented as a meat food product or poultry food product) is published on the FSIS web site at the following address: [http://www.fsis.usda.gov/PDF/Countries\\_Products\\_Eligible\\_for\\_Export.pdf](http://www.fsis.usda.gov/PDF/Countries_Products_Eligible_for_Export.pdf) The eligibility of the origin of the meat or poultry ingredient is a condition stated on the permit(s) issued by APHIS Veterinary Services (VS). Effective March 19, 2009, any permit issued on and after this date by APHIS will have the following condition included: Importer is also responsible for obtaining any required authorization from the USDA, Food Safety and Inspection Service (FSIS). Meat, poultry, or egg product ingredients used in FSIS-exempted products must be prepared under USDA, FSIS inspection or under a foreign inspection system approved by FSIS. Contact FSIS via e-mail at: [permits@fsis.usda.gov](mailto:permits@fsis.usda.gov) or by telephone at: 888 287 7194 for information regarding approved foreign inspection systems and foreign establishments approved by FSIS to export to the United States. A list of countries eligible to import meat, poultry or egg products is published on the FSIS web site at the following address: [http://www.fsis.usda.gov/PDF/Countries\\_Products\\_Eligible\\_for\\_Export.pdf](http://www.fsis.usda.gov/PDF/Countries_Products_Eligible_for_Export.pdf) Importers must be able to provide documented evidence, upon request by FSIS, to support the origin of the meat and\or poultry ingredient used in the food product(s) identified on the APHIS permit.", "FSIS Notice of Enforcement for Exempted Products Page 2 As part of an enhanced enforcement program for food products containing a small amount of meat or poultry, any new permit application submitted to APHIS after June 19, 2009, will be reviewed and approved by FSIS to ensure the meat and\or poultry ingredient originates from an eligible source. The importer will provide to FSIS the supporting documentation that is necessary to allow the food product to enter the United States. If this condition is not met, the imported food will be considered ineligible for importation into U.S. commerce. Ineligible product found in commerce may be subject to destruction. Note that APHIS is providing a 90-day extension for any permit that expires on or before June 19, 2009. At the end of the 90-day extension, the importer will be required to submit a new application, which will comply with the conditions outlined above. Further, the implementation of the enhanced enforcement program for products containing a

small amount of processed egg products will be forthcoming and likely reflect those for product containing a small amount of meat or poultry. The effective date for food products containing small amounts of processed egg products will be provided by USDA prior to implementation. Supporting documentation can take various forms, but as a minimum, FSIS will need documents that (1) evidence the proportion of meat, poultry, or processed egg product ingredients in the product formulation, (2) identify the country of origin of these ingredients, (3) identify the establishment where these ingredients were processed, (4) provide assurance that no other meat, poultry, or processed egg product ingredient is incorporated into the finished product, (5) evidence that the product labeling does not represent the finished product as a meat food product, poultry food product, or egg product, (6) identify of the facility where the finished product, as represented by the labeling, was manufactured, and (7) for products labeled as flavored, provide assurance that such products do not actually contain a meat, poultry, or processed egg ingredient. In addition, the valid APHIS Permit Number [or Application Reference Number] needs to be referenced on all supporting documentation. It should be noted that this enhanced enforcement program does not include food products flavored to resemble meat, poultry or processed egg products if such food products do not actually contain a meat, poultry or processed egg product ingredient. Also, the program does not include products not intended for use as human food such pet feed or pharmaceuticals. Questions concerning this enforcement notice may be directed to FSIS at the following e-mail address:

permits@fsis.usda.gov or at Toll Free number (888-287-7194). March 19, 2009", "15 Letter to Importers, Brokers, Customs and Border Protection (CBP) and Other Interested Parties", "United States Department of Agriculture Marketing and Regulatory Programs Animal and Plant Health Inspection Service Veterinary Services National Center for Import and Export 4700 River Road Unit 40 Riverdale, MD 20737 Phone: 301-734-3277 Fax: 301-734-8226 Subject: Changes to the US Department of Agriculture (USDA), Animal and Plant Health Inspection Service (APHIS), Veterinary Services (VS) Import Permitting Process for Food Safety and Inspection Service (FSIS) Exempted Food Products containing Meat and Poultry Ingredients. To: Importers, Brokers, Customs and Border Protection (CBP) and Other Interested Parties On January 30, 2009, the USDA, APHIS, VS at the request of the USDA, FSIS cancelled certain import permits for FSIS exempted food products containing poultry ingredients. At the same time, VS suspended the issuance of permit applications submitted to APHIS, VS, National Center for Import and Export (NCIE) for all FSIS exempted food products containing small amounts of meat and poultry ingredients. As you are aware, USDA, APHIS regulates products of animal origin under statutory authority of the Animal Health Protection Act to ensure they do not pose a risk to U.S. animal health. USDA, FSIS regulates domestic and imported meat, poultry, and processed egg products under statutory authority of the Federal Meat Inspection Act, the Poultry Products Inspection Act, and the Egg Products Inspection Act for public health. Together, APHIS and FSIS have implemented several policy changes to ensure that imported animal origin products do not pose a risk to either US animal health or public health. For those importers of FSIS exempted food products that contain small amounts of meat and poultry ingredients, FSIS and APHIS have revised how such permits will be issued. The recent suspension of the permitting process has caused a backlog in processing applications and we regret the inconvenience. We are currently processing all permit applications that we receive. Please be advised that all permit applications for FSIS exempted food products containing small amounts of meat and poultry ingredients

submitted to APHIS after June 19, 2009, will be reviewed by FSIS prior to APHIS issuing permits. As part of the new process, after permit applications are submitted to APHIS, they must be reviewed and approved by FSIS to ensure the meat and\or poultry ingredients in such food products originate from an eligible source, i.e., prepared under FSIS inspection or in a foreign establishment certified by a foreign inspection system approved by FSIS. Importers will be required to provide documented evidence directly to FSIS to support the origin of the meat and\or poultry ingredient used in the food product(s) identified on the APHIS permit application. If this condition is not met, FSIS will advise APHIS that the imported food product is ineligible for importation into U.S. commerce, and a permit will not be issued. PURPOSE This guidance document was developed to help establishments that are considering or planning to implement less than daily (LTD) sanitation procedures. These guidelines provide an overview of the planning, development, implementation and maintenance of LTD sanitation procedures. These guidelines address FSIS\u2019 expectations with respect to regulatory requirements, especially those relative to Sanitation SOPs in 9 CFR 416.11416.16 and for prerequisite programs under 9 CFR 417.2 and 417.5. II. BACKGROUND As a common practice, establishments have conducted complete cleaning and sanitizing of their operations on a daily basis. However, there have never been FSIS regulations that required an establishment to conduct cleanup every twenty-four hours or within any other specified period. For the purposes of this document, \u201ctraditional\u201d cleaning addresses the complete cleaning that is typically performed every twenty-four hours and includes procedures such as: \u2022 Removing the gross contamination from equipment and production areas either by hand or with water of a suitable temperature; \u2022 Applying chemicals (detergent, acid or alkali soap) to emulsify or dissolve the food (protein) materials and fats adhering to the equipment; \u2022 Scrubbing the soiled surfaces, if necessary; \u2022 Rinsing to remove the dissolved food and fat materials with water of a suitable temperature; or \u2022 Applying a sanitizer (e.g., chemical disinfectant) to the cleaned food contact surfaces, in accordance with the label instructions to address any remaining microorganisms. Establishments can choose to extend their production operations without conducting \u201ctraditional\u201d cleaning every twenty-four hours. They can select an alternative cleaning frequency provided they ensure that, as a result of the methods utilized, insanitary conditions are not being created that may result in adulteration or contamination of product. Establishments utilizing an alternative sanitation frequency would still conduct \u201ctraditional\u201d cleaning except it would be less frequent, for example one time per week. In addition, they typically will conduct more frequent operational sanitation procedures that may include: - 1 -,"Less Than Daily Sanitation Procedure- Compliance Guideline \u2022 Removing the gross contamination from equipment and production areas either by hand or with water of a suitable temperature; \u2022 Applying chemicals (detergent, acid or alkali soap) to emulsify or dissolve the food (protein) materials and fats adhering to the equipment; An establishment using LTD sanitation procedures must meet all of the sanitation regulatory requirements . 9 CFR 416.1 through 416.5, Sanitation Performance Standards (SPS), and 9 CFR 416.11 through 416.16, Sanitation SOP, set out those requirements. In addition, establishments that implement these procedures as part of a prerequisite program will need to ensure that they address the prerequisite programs in their ongoing verification activities as a means to ensure that the prerequisite programs are being implemented such that they continue to support the decisions made in the hazard analysis (9 CFR 417.1(a)). NOTE: Establishments that develop a LTD sanitation program but continues to conduct their complete pre-op sanitation procedures daily would not be considered to have a LTD sanitation program. These establishments would still be subject to FSIS pre-op sanitation procedures (01B01 and 01B02) as they are scheduled in PBIS III. IMPLEMENTING LESS THAN DAILY SANITATION PROCEDURES When developing an LTD sanitation program, an establishment should consider all factors that

may impact its program. In most cases, FSIS expects that microbial factors affecting sanitary conditions will be the primary focus of LTD sanitation programs. It is well known that bacterial growth is a function of time, temperature, and environmental factors (available nutrients and moisture). In addition, bacteria found on food contact surfaces will affect the condition of the product. Microbes cannot be directly observed by organoleptic methods; therefore, it is likely that most LTD sanitation programs will need to include sampling methods to measure levels of bacterial contamination on food contact surfaces. As guidance for the development of procedures of this type, this document will address the following issues:

- \u2022 Risk considerations
- \u2022 Direct food contact surfaces
- \u2022 Indirect food contact surfaces
- \u2022 Non-food contact surfaces
- \u2022 Lot size or recall implications
- \u2022 Consistency of operation and potential impact on product
- \u2022 Pathogens
- \u2022 Chemicals
- \u2022 Allergens
- \u2022 Collection of Meaningful Data
  - \u2022 Initial (i.e., Baseline)
  - \u2022 Less Than Daily Sanitation Procedure- Compliance Guideline
  - \u2022 Ongoing
- \u2022 Analysis of Data
  - \u2022 Initial (i.e., analysis of baseline data before implementation of LTD sanitation procedures)
  - \u2022 Ongoing (data collected after implementation of LTD sanitation procedures)
- \u2022 Maintenance of the Sanitation SOP (9 CFR 416.14)
- \u2022 Use of analysis to evaluate the effectiveness of the LTD sanitation procedures
- \u2022 Documentation Demonstrating Effectiveness of the Sanitation SOP, including LTD sanitation procedures (9 CFR 416.16)
- \u2022 Maintenance of Sanitation SOP records that demonstrate that the sanitation procedures, including LTD sanitation procedures, are effective in preventing contamination of product.

\u2022 Addressing Noncompliances

A. RISK CONSIDERATIONS

Before implementing LTD sanitation procedures, establishments should consider multiple factors that might have the potential to contaminate product, such as:

- \u2022 Direct Food Contact Surfaces: Surfaces that routinely contact products directly during the course of operations can be the site of growth of bacteria, including spoilage organisms, and these bacteria can contaminate the product when contact occurs. The establishment needs to consider the risk of cross-contamination when designing its LTD sanitation procedures. EXAMPLES: saws, cutting boards, table tops, inside surfaces of choppers, grinders and other equipment.
- \u2022 Indirect Food Contact Surfaces: These areas have a reasonable likelihood of product contact through the course of normal production. Under proper conditions, bacterial growth and spoilage growth are likely in areas where incidental food contact occurs because these surfaces typically are not thoroughly cleaned as often as direct food contact surfaces. The establishment should consider such areas when designing LTD sanitation procedures. EXAMPLES: doorways and posts, employee clothing, outside surfaces of equipment, and rail pull switches.
- \u2022 Non-Food Contact Surfaces: Growth of pathogens and spoilage organisms may be present in areas where incidental food contact accidentally occurs. These

3", "Less Than Daily Sanitation Procedure- Compliance Guideline

surfaces may become a source of direct product contamination or create insanitary conditions that ultimately may affect sanitary conditions in the rest of the establishment. The establishment should consider such areas when designing LTD sanitation procedures.

EXAMPLES: floors, walls, and undersides of tables and work platforms.

\u2022 Lot Size or Recall Implications: The establishment should consider how its sanitation procedures and frequencies affect the determinations of lot size and amount of product represented by any FSIS or company sample. The effectiveness of sanitation may greatly affect the amount of product involved if a recall of product became necessary.

\u2022 Consistency of Operations and Potential Impact on Product: The establishment should consider whether changes to

operational sanitation procedures for extended periods between complete operational sanitation procedures would affect its ability to maintain sanitary conditions, thereby preventing the contamination or adulteration of product \u2022 Pathogens: In addition to the general microbial growth, the establishment should consider pathogen growth on surfaces that might ultimately contaminate the final product. For example, Listeria monocytogenes can form microscopic biofilms on equipment surfaces that the establishment may find difficult to remove during LTD sanitation procedures and that may later affect product through direct contact.

\u2022 Chemicals: Detergents and sanitizers (chemicals) can be toxic at certain levels. The establishment should consider accumulation of residual chemicals on surfaces. \u2022

Allergens: the establishment may wish to consider other information such as the effects allergens might have on all products produced between complete sanitation cleaning procedures. The allergenic proteins can become fixed to food contact surfaces during on-going operations (i.e., between complete sanitation procedures) and potentially become a labeling issue in other foods being processed that would not otherwise contain the ingredient. B.

COLLECT MEANINGFUL DATA After an establishment has considered the risks associated with its operation, the establishment will need to consider what information it should collect. The initial data collected likely will be related to microbiological conditions of the equipment.

However , many factors (e.g. ph, water activity, product characteristics) could affect the product and therefore affect the type, and amount , of data that the establishment ultimately decides is needed to ensure that the alternative cleaning procedures are effective and that sanitary conditions are maintained. 4", "Less Than Daily Sanitation Procedure- Compliance Guideline 1. Initial Testing (i.e. baseline data collection) When developing a sanitation program, the establishment should consider all factors that may have an impact on the program and address them when developing a Sanitation SOP. A microbiological baseline study may provide a starting point for such consideration. Baseline testing, while not required, is highly recommended as a means to develop criteria that can be used to evaluate the ongoing effectiveness of a LTD sanitation program. Using the criteria developed from the baseline study, ongoing microbial testing may be an effective means to demonstrate that all food contact surfaces are cleaned often enough to prevent the creation of insanitary conditions and adulteration of product. If the establishment chooses not to conduct a baseline study, it may be difficult to demonstrate that the use of a LTD sanitation procedure will meet the sanitation regulatory requirements. 2. Microbiological Baseline Studies: The regulations do not require baseline studies, nor are there any requirements for levels of testing in a baseline study.

However, a baseline study can serve as a basis from which the establishment can determine the microbiological operating levels and limits for its facility under normal operating conditions. A baseline study would include evaluating the establishment\u2019s sanitary conditions following \u201ctraditional\u201d pre-operational and operational sanitation procedures before implementation of any changes in sanitation procedures or frequencies. The generation of baseline microbial data provides a mechanism that enables the establishment to determine where it started under normal operating conditions. The data then forms the basis for comparison of the alternative procedures to the \u201ctraditional\u201d procedures. In establishments planning on implementing LTD sanitation procedures, baseline studies can provide information for the establishment to use to compare the efficacy of LTD sanitation procedures in controlling microbial levels to those of its traditional sanitation procedures. The

establishment can use the data obtained from the traditional operations to develop acceptable tolerance levels that would become part of a statistical process control (SPC) monitoring program. When designing a microbial sampling program, the establishment should survey its operation to determine what measurements of its process can provide an accurate assessment of overall sanitation. Because of the number of variables that could exist, adequate time should be taken to collect enough data to account for all the variables. Some attempt should be made to determine \u201cworst case\u201d scenarios. For example, a \u201cworst case\u201d scenario would consider: \u2022 When to sample (e.g., at the end of the last production shift during the time of day or year when the ambient temperature is the hottest or most humid)  
5,"Less Than Daily Sanitation Procedure- Compliance Guideline \u2022 Where to sample (e.g., areas on the equipment where microbial contamination is most likely to occur; are most likely to affect products; or most likely to harbor bacteria) 3. Baseline Study: Example There is no required format for baseline studies. Establishments may develop baseline studies following the steps below:

- 1) Describe testing protocol
- a) Describe the focus of testing (for example)
- b) Aerobic Plate Count (APC)
- c) Total Plate Count (TPC)
- 2) Identify sample collection methodology
- a) Sponge
- b) Swab
- c) SpongeSicle
- d) Product
- i) Type (pre or post packaged as applicable)
- ii) Amount
- 3) Identify frequency of testing
- a) How many times per day or week or month
- b) How many pieces of equipment or product per test
- 4) Identify sample sites
- 5) Sampling of each identified food contact surface should be conducted using a statistically validated sampling plan so that adequate baseline data are collected for each food contact surface throughout the baseline study.
- 6) Randomized patterns for sampling each food contact surface are recommended.
- 7) Define any relevant measurements that are used by the establishment. For example:
- a) CFU/in<sup>2</sup>
- b) CFU/cm<sup>2</sup>
- c) CFU/g
- 8) Describe analysis of results
- a) Identify statistical methods
- b) Initial analysis
- c) On-going analysis
- 9) Describe comparison of microbial results (for example)
- a) Traditional daily sanitation vs. LTD sanitation
- b) Start of operation vs. end of operations
- c) Start of operations vs. during operations
- d) Comparison of results at different sample sites to determine most effective sites for ongoing monitoring
- 10) Determine operational limits
- a) sanitary vs. insanitary
- 11) Determine actions to be implemented when limits are exceeded

a) Initial 6,"Less Than Daily Sanitation Procedure- Compliance Guideline b) On-going 4. On-going testing Once the establishment determines the microbial conditions that exist under traditional operating conditions, it may decide to conduct on-going microbial testing as part of the LTD sanitation procedures. These data will enable the establishment to compare the initial baseline test results to the on-going test results in order to ensure that the procedure is effective over time. The establishment could then demonstrate that the alternative sanitation procedures are effective, and that product is not contaminated. Ideally, the establishment has collected baseline data so that it knows the sanitation conditions under normal operational conditions. The establishment should conduct ongoing testing after it makes the change to LTD sanitation procedures for comparison with the baseline results. This verification testing provides the establishment with an indication of continued success of the LTD sanitation procedures after initial implementation. In order to demonstrate the effectiveness of the sanitation procedures, the ongoing testing program should be designed to make comparisons with the baseline program. \u2022 Ongoing testing should use methods that are the same as those used to collect baseline data \u2022 Ongoing testing should use similar sample sites or a relevant subset, as the baseline sites \u2022 Initially, ongoing testing should be conducted at a

high frequency in order to demonstrate that the establishment is consistently maintaining sanitary conditions Over time, if the data demonstrate that the program is effective, the establishment may be able to support a reduced sampling frequency. C. ANALYSIS OF DATA Demonstrating the ongoing effectiveness of alternate frequency sanitation procedures requires more than simply collecting raw data. The data should be meaningful (i.e., it provides a basis to assess whether the LTD sanitation procedures and the Sanitation SOP are effective in ensuring food safety, whether product is being contaminated or adulterated, and whether insanitary conditions are being created). The establishment should consider what the data mean, and how they relate to the ongoing effectiveness of the sanitation procedures. Records should document that the results of the baseline study and ongoing testing (or other information) demonstrate compliance with sanitation requirements. Valid conclusions can only be made if the establishment has adequately developed and implemented the design of their cleanup program.

7", "Less Than Daily Sanitation Procedure- Compliance Guideline 1. Initial (i.e. baseline or pre-implementation data): The establishment should analyze its findings in order to establish the effectiveness of its LTD sanitation procedures. Establishments should gather the information and data and put them together in a clear concise format that ties all the information together. Ultimately, the establishment\u2019s records should show that it is maintaining sanitary conditions, and that product is not contaminated or adulterated.

2. Ongoing (data collected once procedure implemented): It is very important that the establishment compare the data collected during ongoing testing to the initial baseline data. The data analysis should demonstrate that, over time, after the procedures have been implemented, microbial levels on equipment are no higher than the baseline levels obtained before the implementation of the new procedures. The comparison of these data should consider general trends over an extended period of time. While small daily variations may be insignificant and are to be expected, the data analysis should demonstrate that over time, microbial levels on equipment have not increased (i.e. are not statistically significant) because of the implementing of the new procedures. The establishment should monitor microbial levels on equipment surfaces as a means of demonstrating that the new procedures are effective. Ultimately, the indicator of success in the use of the procedures of this type is an establishment's ability to demonstrate, by means of data or other documentation, the continual effectiveness of the new procedures and frequencies to maintain sanitary conditions and prevent direct contamination or adulteration of product.

D. MAINTAINING THE SANITATION SOP (9 CFR 416.14) Regardless of where establishments choose to incorporate their LTD sanitation procedures (Sanitation SOP, GMP or other prerequisite program), 9 CFR 416.14 requires that establishments maintain their Sanitation SOP and ensure that it continues to be effective. The establishment needs to routinely evaluate the effectiveness of the Sanitation SOP as a means to ensure that the procedures and frequencies continue to prevent the contamination or adulteration of product. There are no regulations that specify how an establishment is to determine whether the Sanitation SOP is effective. Typically, the establishment will periodically review Sanitation SOP records to evaluate the effectiveness of the Sanitation SOP. As previously stated, microbial testing is not a regulatory requirement in Sanitation SOPs; however, it can be one means used by an establishment to demonstrate the effectiveness of its sanitation program. In the absence of microbial data to support the baseline or ongoing testing, the establishment would need to provide other records to document

sanitary effectiveness. Ideally, an establishment's comparison of microbial testing data should indicate that the microbial levels in the facility resulting from the use of the LTD sanitation procedures are the same as, or lower, than those resulting from the use of the establishment's traditional sanitation procedures and frequencies. 8", "Less Than Daily Sanitation Procedure- Compliance Guideline If the data show that the microbial levels associated with the LTD sanitation program are significantly higher than those of the traditional program, the efficacy of the program in preventing product contamination or adulteration would be in question. An establishment would want to review as many available establishment records as possible, including FSIS Noncompliance Records (NR), in order to provide a basis that would assure the establishment that the Sanitation SOP is effective. However, the establishment should not claim that the lack of FSIS NRs demonstrate that the Sanitation SOP is effective. NRs address specific regulatory noncompliances. The absence of NRs provides little assurance of the overall efficacy of the establishment's sanitation procedures and frequencies in preventing product contamination or adulteration. The most important aspect of the evaluation of the Sanitation SOP is that when the establishment determines that there are issues of concern, it responds to those issues. Operations within an establishment rarely remain unchanged. Without periodic adjustments to the Sanitation SOP, or any sanitation related program, it may be difficult to demonstrate that the procedures in place continue to prevent the contamination or adulteration of product. The following is a summary of what an establishment may do to ensure that the Sanitation SOP remains effective:

- 1) Routinely review and evaluate the Sanitation SOP as required in 416.14 (i.e., not simply when FSIS suggests it)
- a) Evaluate Sanitation SOP records and consider what did or did not work
- i) Evaluate monitoring procedures and frequencies and consider if they are working
- ii) Evaluate previous corrective actions
- (1) Consider if they have been fully implemented and effective
- (2) Consider if or how they could be improved
- b) Consider whether the Sanitation SOP procedures have prevented the contamination or adulteration of product (e.g., have there been situations where contamination or adulteration of product, or contamination of food contact surfaces occurred?)
- c) Review the results of any microbiological testing and consider whether those results reflect an environment that will not contaminate or adulterate product
- d) Review any SOP, GMP or prerequisite sanitation related programs that are in use and consider what effect they appear to be having on the Sanitation SOP (e.g., have they been implemented as written? Does their implementation help ensure that product is not contaminated or adulterated?)
- i) Employee Hygiene
- ii) Employee Training
- iii) Product Reconditioning

2) Revise Sanitation SOPs as often as necessary. Sign and date the Sanitation SOP if changes are made (9 CFR 416.12(b))

9", "Less Than Daily Sanitation Procedure- Compliance Guideline

E. DOCUMENTATION DEMONSTRATING THE EFFECTIVENESS OF THE SANITATION SOP AND LESS THAN DAILY SANITATION PROCEDURES

FSIS believes that sanitation is, as addressed in the Pathogen Reduction\HACCP Final Rule (Federal Register, Thursday July 26, 1996, Page 38805 \u2013 38855), essential for food safety, and that sanitary facilities or equipment create an environment suitable to prevent the contamination or adulteration of products. As a result, establishments are required to develop Sanitation SOPs as a prerequisite to effective operation of their food safety system and as a means to minimize the risk of direct product contamination and adulteration. Documentation related to the implementation of the Sanitation SOP, as required by 9 CFR 416.16, provides verifiable evidence that the establishment's Sanitation SOP is effective at maintaining

sanitary conditions, which prevents the adulteration of product. The establishment is required to maintain records associated with the implementation of the Sanitation SOP. If the LTD sanitation procedures are part of the Sanitation SOP, then the records generated by the implementation of the Sanitation SOP, and all the procedure therein, are subject to FSIS review under 9 CFR 416.17. Because the Sanitation SOP and any additional sanitation programs are a prerequisite to food safety, it is essential that documentation be available to demonstrate that these programs are achieving their goals, and that establishments are verifying that the implementation of these programs continue to support any decisions related to food safety. FSIS will review those records in order to verify that the establishment is implementing the program as written and that it is effective.

**F. ADDRESSING NONCOMPLIANCES**

The LTD sanitation procedure should include the means by which the establishment will address noncompliances. If the LTD sanitation procedure is incorporated into the Sanitation SOP, the establishment would be expected to implement corrective actions in accordance with 9 CFR 416.15. 10"]}, {"file\_name": "FSIS\_GD\_2006\_0007", "title": "Letter to Industry about the Safe Handling Labeling of Uncooked, Breaded, Boneless Poultry Products", "num": "FSIS-GD-2006-0007", "id": "b597783a5d5473350f531df6f96636384dd54797bd595b1d17ba1cea3a5a657a", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Letter\_to\_Industry\_on\_Frozen\_Uncooked\_Poultry.pdf", "type": "pdf", "n\_pages": 2, "word\_count": 780, "text\_by\_page": ["1 MOBILE SLAUGHTER UNIT COMPLIANCE GUIDE This guidance document follows the procedures for guidance documents in the Office of Management and Budget\u2019s (OMB) \u201cFinal Bulletin for Agency Good Guidance Practices.\u201d More information on OMB\u2019s policies and procedures can be found on the FSIS Web page: [www.fsis.usda.gov/Significant\\_Guidance/index.asp](http://www.fsis.usda.gov/Significant_Guidance/index.asp) FSIS encourages those who own or manage mobile slaughter units to avail themselves of this guidance in meeting the pertinent regulatory requirements. This document includes recommendations rather than regulatory requirements. FSIS requests that all interested persons submit comments regarding any aspect of this document, including but not limited to: content, readability, applicability, and accessibility. The comment period will be 60 days. The document will be updated in response to comments. Comments may be submitted by either of the following methods:

**eRulemaking Portal:** This Web site provides the ability to type short comments directly into the comment field on this Web page or attach a file for lengthier comments. Go to <http://www.regulations.gov> Follow the online instructions at that site for submitting comments.

**Mail, including floppy disks or CD-ROMs, and hand- or courier-delivered items:** Send to Docket Clerk, U.S. Department of Agriculture (USDA), FSIS, Room 2-2127, George Washington Carver Center, 5601 Sunnyside Avenue, Mailstop 5474, Beltsville, MD 20705-5474.

**Instructions:** All items submitted by mail or electronic mail must include the Agency name and docket number FSIS-2010-0004. Comments received in response to this docket will be made available for public inspection and posted without change, including any personal information, to <http://www.regulations.gov>.

**2 I.DEFINITION** Mobile slaughter unit: A mobile slaughter unit (MSU) is a self-contained slaughter facility that can travel from site to site.

**II.PURPOSE** This guideline is intended for owners and managers of a new or existing red meat or poultry MSU who want their establishment to come under Federal inspection and continue operations in accordance with Food Safety and Inspection Service (FSIS) regulations. MSU operators are

subject to the same regulatory requirements that apply to a fixed (\u201cbrick and mortar\u201d) facility. This guideline includes the procedures necessary to receive a Federal grant of inspection, unique concerns that may arise with mobile slaughter units, and links to review regulatory requirements and resources.

**III. ADVANTAGES OF MOBILE SLAUGHTER**

The meat and poultry industries have become increasingly consolidated, while consumer interest in locally grown and specialty products has continued to expand<sup>1</sup>. The industry consolidation has resulted in a lack of U.S. Department of Agriculture (USDA) or State-inspected establishments available to small producers of livestock and poultry in some remote or sparsely populated areas. These small producers often serve the needs of their community and the growing demand for forage-fed, natural, and organic meat and poultry products. MSUs can serve multiple small producers in areas where slaughter services might be unaffordable or otherwise unavailable. Therefore MSUs can help small producers meet this demand, expand their businesses and create wealth in rural communities.

The advantages of a MSU versus a fixed structure include lower processing costs, reduced stress on animals, lower capital investment, and less resistance from municipalities and neighbors<sup>2</sup>.

**IV. WHAT IS NEEDED TO OPERATE A MSU UNDER FEDERAL INSPECTION**

A. Grant of Inspection

Contact the District Office (DO) that has jurisdiction over the geographic area in which you will primarily operate the MSU. The DO will send you an information packet and an Application for Federal Meat, Poultry or Import Inspection, FSIS Form 5200-2. A list of DO locations and contact information is available (see [http://www.fsis.usda.gov/Contact\\_Us/Office\\_Locations\\_&\\_Phone\\_Numbers/index.asp](http://www.fsis.usda.gov/Contact_Us/Office_Locations_&_Phone_Numbers/index.asp)).<sup>3</sup>

There are seven basic steps required for obtaining Federal meat and poultry inspection in the Federal Grant of Inspection Guide (see [http://www.fsis.usda.gov/Regulations\\_&\\_Policies/Grant\\_of\\_Inspection\\_Guideline/index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/Grant_of_Inspection_Guideline/index.asp)). By clicking on each bullet heading under the Steps Required for Obtaining Federal Meat and Poultry Inspection, you will see a detailed description of each step, including regulatory citations, forms, and sample forms. The steps are:

1. File an Application for Inspection
2. Facilities Must Meet Regulatory Performance Standards
3. Obtain Approved Labels or Brands
4. Obtain Approved Water Source Letter
5. Obtain Approved Sewage System Letter
6. Provide a Written Standard Operating Procedure for Sanitation
7. Provide a Written Hazard Analysis and HACCP Plan

Only the application for a Federal grant of inspection is to be submitted to the DO. All other documents relative to the above list are to be maintained on file at the facility and made available for review by inspection program personnel (IPP) upon request. DO representatives are available to assist you with the application process and to answer any additional questions you might have concerning regulatory requirements. Upon receipt of your application and completion of all preliminary items, a designee of the DO will review the MSU. If all documentation and the facility comply with regulatory requirements, then a conditional grant of inspection will be issued to allow you 90 days to validate your HACCP program.

**Operating in Several Districts:** For a MSU that will operate in more than one district, the owner is to first file an application for inspection in the Headquarters district in which the unit will primarily operate. The Headquarters DO will assign the primary establishment number (e.g. Est. 00). A separate application is then sent by the MSU owner to each additional district in which operations will be conducted. The remaining districts will use the same establishment number, but with an additional alphabetical suffix (e.g. 00 A, 00 B, etc.) that identifies the establishment when it operates within that specific district. Plant profiles in each district will record that the

MSU is \u201cding business as\u201d 00, 00 A, 00 B. The Headquarters DO may designate a liaison or case specialist to coordinate information sharing between districts regarding MSU activities and regulatory compliance trends. This will also facilitate food safety assessments which will be the primary responsibility of the Headquarters DO. (A food safety assessment considers all food safety aspects that relate to an establishment and its environment, the nature and", "4 source of all materials received, and the plant\u2019s processes and products.) The grant holder is to ensure that IPP have access to the MSU at all times whenever a request for access is made, in accordance with the Federal Meat Inspection Act, Sec. 606 (\u201caccess at all times, day or night, whether the establishment be operating or not\u201d) and the Poultry Products Inspection Act, Sec. 11 (\u201caccess to their places of business and opportunities to examine\u2026\u201d). Scheduling: Every time the MSU moves to a different location, and before conducting any slaughter operations, the respective DO with oversight of that location will be notified by the MSU operator. FSIS realizes that ordinary schedules described in the regulations may not be applicable to most MSUs. However, the MSU operator needs to provide to any district in which he or she will operate a schedule of days and hours of operation in accordance with Title 9 of the Code of Federal Regulations (9 CFR) 307.4(d)(1) for meat or 381.37(d)(1) for poultry. The operations schedule needs to be provided as much in advance as possible, allowing adequate time for the DO to arrange staffing and inspection procedure schedules necessary for FSIS services. At least two to four weeks advance notice is recommended, depending upon the degree of predictability and consistency of MSU operations. The submitted work schedule is to specify the daily clock hours of operations and lunch periods. Any changes in the schedule must be approved by the DO. If the MSU will operate on a seasonal basis only, the dates of operation are to be specified for the DO. Voluntary suspension of operations to cover temporary inactive periods not to exceed 120 calendar days can be requested in writing through DO channels. NOTE: The staffing of mobile slaughter units may present a challenge to FSIS. It may be difficult for the Agency to find personnel to provide inspection at the location at which a unit intends to operate. Thus, communication with the DO by the operator of the mobile unit is particularly important. B. Sanitation Requirements Meat and poultry establishments with a grant of inspection from FSIS are to conduct operations under all of the provisions of 9 CFR Part 416--Sanitation (see [http://www.access.gpo.gov/nara/cfr/waisidx\\_07/9cfr416\\_07.html](http://www.access.gpo.gov/nara/cfr/waisidx_07/9cfr416_07.html)).", "5 A detailed explanation of the sanitation regulations, including methods already proven to meet the regulatory requirements, is in the Sanitation Performance Standards Compliance Guide (see [http://www.fsis.usda.gov/Regulations\\_&\\_Policies/Sanitation\\_Performance\\_Standards/index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/Sanitation_Performance_Standards/index.asp)). 1. Sanitation Performance and Unique Considerations for MSUs a. Water In order to receive a grant of inspection all Federal establishments must provide FSIS personnel with documentation certifying that the supply of water, no matter what the source, complies with the National Primary Drinking water regulations (40 CFR Part 1410). The MSU may operate at a location where it can directly utilize either a municipal water supply or private well water. Alternatively, it is permissible to transport water in a tank to the slaughter location as long as there is a water report certifying the potability of the water source. This documentation needs to be made available for FSIS review at all operational locations before initiating slaughter activities at that specific site. For a private well, this documentation is to be renewed semiannually for any recurring slaughter location (e.g., a specific ranch or farm where the MSU

operates at various times throughout the year). Some MSUs will be working in conjunction with a FSIS inspected (official) fabrication facility where they obtain their water. In all cases, the availability of documentation certifying that water sources are potable is a continuing requirement. Water supply requirements are covered in the sanitation regulations in 9 CFR 416.2(g)(1). IPP will verify that the MSU meets these requirements in accordance with FSIS Directive 5000.1(see

<http://www.fsis.usda.gov/OPPDE/rdad/FSISDirectives/5000.1Rev3.pdf>). b. Sewage and Waste Water Disposal The MSU operator is to provide FSIS with a letter of approval from the local health authority for any specific slaughter site. A MSU will usually not have traditional sewage facilities unless there is access to a private septic system provided at the slaughter location. Some MSUs may have a holding tank and will haul waste water for discharge at a MSU docking station. Alternatively, waste water disposal might be adapted for the specific situation. For example, blood and waste water might be dispersed on the producer's property well away from any stream or drainage, provided the local health authority permits this. In any case, the MSU operator is to provide a letter", "6 from the local health authority relating to waste water handling at any specific operational site. This is required to obtain and uphold terms of the grant. c. Grounds and Facilities The walls, floors, and ceilings of the MSU are to be built of durable materials impervious to moisture which can be cleaned and sanitized as necessary to prevent product adulteration or creation of insanitary conditions (9 CFR 416.2(b)(1and 2)). Adequate heat and insulation will help prevent freezing of water pipes during cold weather operation. The operator is to maintain the MSU and implement a program to prevent harborage or entry of pests. Methods to prevent pest entry could include: 1) Keep doors and windows closed as much as possible. 2) Use high output fans to prevent entry of flying insects. 3) Spray and bait for flies prior to the day of slaughter. 4) Apply a spray-on surfactant or a mixture of water and mineral oil to the hide of livestock before skinning to reduce the risk of flies contaminating edible product. 5) Control of rodents around docking stations or any other operational areas, and where the MSU will be stored during non-operational hours. Pest control substances must be approved by the Environmental Protection Agency (EPA) for use in food processing environments and be used in a manner that does not adulterate product or create insanitary conditions. Under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), EPA reviews pesticide formulation, intended use, and other information; registers all pesticides for use in the United States; and prescribes labeling, use, and other regulatory requirements to prevent unreasonable adverse effects on the environment, including humans, wildlife, plants, and property. Any meat or poultry establishment using a pesticide must follow the FIFRA requirements. The grounds immediately surrounding the MSU operational site are to be maintained to prevent creation of insanitary conditions that could lead to adulteration of product. Positioning the MSU on a well-draining concrete or gravel pad can be helpful for controlling manure, mud, pooling water, and other sanitation problems. Bleeding animals on a sloped concrete pad equipped with lines to a drain field is recommended, or alternatively, a gravel bed can allow blood and water to drain and prevent pooling. The position of doors into the MSU should be considered relative to prevailing winds to help control airborne dust, agricultural chemicals, or odors associated with the operational site. If a combustion engine generator is used as a power source for the MSU, then exhaust emissions should not create odors which affect sanitary operation of the MSU.", "7 Adequate ventilation in the small space

of a MSU is of utmost importance to control odors, vapors, and condensation to prevent adulteration of product (9 CFR 416.2(d)). b. Sanitary Facilities and Office Accommodations for Inspection Personnel Hand washing and toilet facilities are required for IPP and MSU employees (9 CFR 416.2(h)(1-2)). While these provisions may not be located inside the MSU, they should be available within a \u201creasonable\u201d distance. For example, portable toilets and hand sanitizer outside the MSU with hand washing facilities available inside the unit would be considered reasonable accommodations. Some MSUs will operate on the producer\u2019s property and farm toilet facilities may suffice if within a reasonable distance. Other MSUs may operate in close proximity to a public building, or an associated official fabrication facility, where these accommodations are located. In all cases, the DO will determine what constitutes \u201creasonable\u201d accommodations. Inspectors need not have an official office within a MSU if it operates as part of a combination or patrol assignment. Alternatively, the USDA inspector may have access to an office in an associated official fabrication facility. Any other arrangements for the equivalent of office space and required facilities in accordance with 9 CFR 307.1 and .2, or 381.36, are acceptable if approved by a designee of the DO. However, it is recommended that the MSU provide a desk with adequate lighting, chair, cooler or refrigerator space for storing laboratory samples (e.g., residue or microbiological specimens) collected by IPP, and a cabinet that can be padlocked for storing USDA brands and official documents. The DO will determine the logistics on a case-by-case basis for IPP phone communications (e.g., use of cell phones) as well as arrangements for FSIS shipment of laboratory samples (either directly from the MSU operational site or by means of inspector transport of samples to a central package pick-up location).

2. Sanitation Standard Operating Procedures (Sanitation SOPs)

A federally inspected MSU is to comply with 9 CFR 416.11 and 416.12 requiring establishments to develop, implement, and maintain written standard operating procedures for sanitation. All recordkeeping requirements of 9 CFR 416.16 apply to a MSU. Records are to be kept in the MSU and made available to IPP upon request. Additional information regarding Sanitation SOPs is available through Commonly Asked Questions from Small and Very Small Plants on Sanitation Standard Operating Procedures (see

[http://www.fsis.usda.gov/Help/FAQs\\_SSOP\\_3/index.asp](http://www.fsis.usda.gov/Help/FAQs_SSOP_3/index.asp)).

"8 C. Hazard Analysis and Critical Control Point (HACCP) Systems

A written hazard analysis and slaughter HACCP plan tailored to your MSU will need to be developed by an individual trained in HACCP principles before you will be granted Federal inspection (9 CFR 304.3(b) or 381.22(b)), and thereafter you will need to implement and maintain them in order to continue operations. A hazard analysis is the process used to determine the food safety hazards reasonably likely to occur in the production process and to identify the measures that the establishment can apply to control those hazards. Whenever a hazard analysis identifies a food safety hazard that is reasonably likely to occur, a written HACCP plan must be developed. Typical slaughter hazards might include, but are not limited to: 1) Control of feces, ingesta, or milk contamination; 2) Disease-producing microorganisms (E. coli O157:H7; Salmonella); and 3) Chemical, pesticide, or drug residues. Chilling and cold storage of product may occur within the MSU or in an associated fabrication facility, depending upon hazard analysis decisions. The MSU operator is not restricted to producing only whole or partial carcasses, but any further processing activities are to be included in the HACCP plan and associated supporting documents. Additionally, all 9 CFR 417.5 recordkeeping requirements apply to a MSU. The hazard analysis and HACCP plan for a

MSU need not be overly complicated. However, a MSU operator may want to utilize an outside consultant who is not employed by the establishment to develop its food safety system. The FSIS Outreach office (see [http://www.fsis.usda.gov/About\\_FSIS/OOEET/index.asp](http://www.fsis.usda.gov/About_FSIS/OOEET/index.asp)) can provide information on HACCP workshops, as well as a self-study guide and video. They can also assist in directing you to contacts for the Small Business Regulatory Enforcement Fairness Act (SBREFA). Additionally, each State assigns HACCP Coordinators to assist establishments with the development of HACCP programs (see

[http://www.fsis.usda.gov/contact\\_us/state\\_haccp\\_contacts\\_&\\_coordinators/index.asp](http://www.fsis.usda.gov/contact_us/state_haccp_contacts_&_coordinators/index.asp)). D. Slaughter Regulatory Concerns 1. Meat (Livestock) -- MSU operators are to comply with all livestock slaughter regulations described in 9 CFR Parts 307 through 314. This includes microbiological testing requirements such as generic E. coli testing (9 CFR 310.25(a)). Humane Slaughter of Livestock is addressed in 9 CFR Part 313. FSIS recommends that slaughter facilities, including MSUs, use a systematic", "9 approach to humane slaughter, with a focus on treating livestock in a way that includes minimizing excitement, discomfort, and accidental injury when unloading or driving animals. The MSU operator is responsible for meeting all regulatory requirements for humane slaughter of livestock and should carefully consider the design of any holding pens, driveways, and ramps available at any specific operational site, as well as the methods used to adequately restrain animals and produce immediate insensibility upon stunning. In most circumstances, if a firearm is used then the head cannot be saved for edible product, except for the tongue. FSIS authority for enforcing humane handling requirements commences when animals begin being handled by either the MSU operator or livestock owner as they are staged for slaughter. FSIS Directives 6900.1 and 6900.2 contain additional information on humane handling (see

<http://www.fsis.usda.gov/OPPDE/rdad/FSISDirectives/6900.1Rev1.pdf>

<http://www.fsis.usda.gov/OPPDE/rdad/FSISDirectives/6900.2Rev1.pdf>). Each MSU operational site is to provide an ante-mortem pen for IPP to observe live animals at rest and in motion, as well as a holding pen for animals designated as U.S. Suspects. Any diseased or disabled animals requiring further inspection are to be provided a covered pen sufficient to protect them from adverse weather conditions. Livestock carcasses of varying species, or custom slaughtered carcasses held and transported in the MSU, are to have adequate separation or protective wraps in order to minimize potential cross-contamination caused by carcass-to-carcass contact. Inedible articles are to be denatured and handled in accordance with 9 CFR 325.11 and 325.13. 2. Poultry -- MSU operators are to comply with all poultry slaughter regulations in 9 CFR Part 381, including slaughter in accordance with good commercial practices as described in 9 CFR 381.65(b). Generic E. coli testing requirements apply in accordance with 9 CFR 381.94(a). Inedible articles are to be denatured and handled in accordance with 9 CFR 381.95 and 381.193. 3. Special labeling claims (such as \u201call natural\u201d) for meat and poultry products require prior-approval by the Labeling and Policy Development Division (LPDD) (ph: 301-504-0878, FAX: 301-504-0873). You are to submit to this office a copy of the label plus supporting documentation or statements to substantiate any special claims. Links are included in the [www.fsis.usda.gov](http://www.fsis.usda.gov) Website for: Animal Raising Claims, Natural and Organic Claims, and \u201cCertified Organic\u201d. (see", "10

[http://www.fsis.usda.gov/Regulations\\_&\\_Policies/claims\\_guidance/index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/claims_guidance/index.asp)). 4. Proper carcass and offal disposal may be accomplished in a variety of ways. Please contact your local

health regulatory authority for more information about alternatives in your area. For example, denatured meat or poultry offal might be allowed to remain on the farm to be composted for use as a soil amendment when permitted by local regulations. Many producers prefer this practice because soil nutrients will be increased, and the higher cost of rendering will be avoided.

5. If FSIS retained product held for further examination is to be transported in the MSU to an official facility for a Public Health Veterinarian\u2019s determination of product disposition, then the establishment needs to obtain FSIS approval of the means used to secure the carcass and parts in accordance with 9 CFR 307.2(h) and 310.3, or 381.77.

6. Exotic animals (e.g., bison, elk) or poultry (e.g., migratory waterfowl, game birds) slaughtered under voluntary Federal inspection are to comply with 9 CFR Part 352 or Part 362, respectively.

V. Additional Information The Niche Meat Processor Assistance Network, sponsored in part by USDA\u2019s Rural Development Agency and the Cooperative State Research, Education, and Extension Service (CSREES) provides additional helpful information about designing a unit, workforce management issues, and other non-regulatory information (see [http://www.extension.org/pages/Mobile\\_Slaughter/Processing\\_Units](http://www.extension.org/pages/Mobile_Slaughter/Processing_Units)).

This guidance provides a summary on the date of slaughter and date of packing required in Title 9 of the Code of Federal Regulations (9 CFR), Section 381.126(a) and (b). Additionally, there are questions and answers at the end of the Notice to help clarify the issue. The product dating requirements are first and foremost related to the quality of the product and not an issue regarding food safety. Slaughter dates, pack dates, and date codes were originally intended for use by retailers for inventory control and for determining other dates voluntarily provided on consumer package labeling, e.g., \u201csell by\u201d and \u201cuse by\u201d dating, in compliance with 9 CFR 381.129(c)(2) of the regulations. Lastly, in order to consolidate all poultry product dating information in one location, the Constituent Update that was published in 1999 regarding the options available for compliance with 9 CFR 381.126 requirements has been updated and included in this Notice, in addition to the 2002 FSIS web guidance document entitled \u201cChanging Dates on Labeling.\u201d Current Regulatory Requirements Title 9 CFR Section 381.126(a) requires that either the immediate container or the shipping container of all poultry food products be marked by code or otherwise with the date of packing. The date of packing is

the date when the finished product is packed into the immediate container, i.e., consumer package. Historically, the slaughter date, process date, and pack date were generally the same date since most poultry was slaughtered, processed, and packaged on the same day. In today's market, we recognize that products are often subjected to additional processing and may be slaughtered and further processed over a period of time. Thus, the pack date (date product is packaged) may not be the same as the slaughter or processing date. Although the pack date is related to product quality rather than product safety, it may not be misleading. In addition, the pack date is not used to convey the date that consumer packaged products are placed in the shipping container nor is the pack date used to convey a date when finished packaged products are simply removed from the package and repackaged into a new container. To simply unwrap and rewrap products for the purposes of including a new pack date would be false and misleading and, thus, would misbrand the product under the Poultry Products Inspection Act (PPIA). In contrast, if products are packaged, stored, then further processed and repackaged, a new pack date is acceptable on the repackaged product."

"Section 381.126(b) of the regulations requires the immediate containers of dressed poultry to be marked with a lot number which shall be the number of the day of the year on which the poultry was slaughtered or a coded number. 'Dressed poultry,' for the application of this section of the regulations, means slaughtered, defeathered, eviscerated whole birds with the head and feet removed, i.e., a ready-to-cook whole bird. Further processed poultry, e.g., cut-up, marinated, breaded, etc., products are not considered to be dressed poultry and fall under section 381.126(a) not (b) of this regulation.

Packing Dates on Poultry Labeling (Revised Policy Previously Conveyed in FSIS Constituents Update Dated 12/17/99) Since 1972, FSIS has required poultry products to include a date of packing, either as a calendar date or a code (9 CFR Section 381.126(a)). FSIS has permitted the use of a sellby or use-by date in lieu of the required date of packing. Several years ago, an issue regarding the appropriate application of the Federal poultry products inspection regulations on "date of packing" (9 CFR 381.126(a)) arose. The circumstances involved a processor who packages poultry food products in consumer-ready film-wrapped packages that are in refrigerated storage awaiting shipment to customers when orders are received. At the time an order is received, a price label and sell-by date are applied to the consumer packages, which are then placed in master shippers to which box end labeling, including a "pack date," is applied. The pack date that has been applied, however, has been the date the consumer packages are placed in the shipper, not the original pack date on which the poultry was placed in the consumer packaging. As stated above, the application of the date the consumer packages are placed in the shipper does not meet the intent of the "pack date" that is required by Federal regulations. The regulations state that the pack date can be applied to the shipper or immediate containers of poultry food products using either a code or the actual calendar date of packing. The date of packing, however, must be the original date the poultry is placed in the consumer packaging (immediate container); the use of any other calendar date will mislead consumers. After discussions with the company and the National Chicken Council, it was resolved that, perhaps, misinterpretation of the pack date provisions has occurred within industry. Understanding that the immediate containers, i.e., consumer package, or the shipping containers of poultry food products, must be marked with the original pack date, there are actually four options available to poultry processors to comply with the packing date provisions,

one of which must be used. These options are: \u2022 a code is applied that represents the original pack date of the poultry food product in the consumer package, or \u2022 the original pack date of the poultry food product is applied to the consumer package or the shipping container accompanied by an explanatory statement, e.g., "packing date" (per 9 CFR 381.129 (c) (2)), or \u2022 the original pack date of the poultry food product is applied to the consumer package or the shipping container along with a date representing when the,"3 consumer packages are placed in shippers. In this case, each date must be accompanied by an explanatory statement in accordance with 9 CFR 381.129 (c) (2), e.g., "packing date," and "date put in shipping container," or \u2022 the use of a calendar date, e.g., \u201csell-by,\u201d \u201cu01cuse-by,\u201d etc. (per 9 CFR 381.129 (c) (2)), in lieu of the original pack date of the poultry food product is applied to the consumer package or the shipping container. Changing Dates on Labeling An issue that has recently been raised is the legality of changing calendar dates, e.g., sellby dates, use-by dates, etc., that appear on meat or poultry products. Poultry products are required to include a date of packing, either as a calendar date or a code. A food retailer may not modify a "packing\pack" date on a product packaged under Federal inspection. Additionally, FSIS has permitted the use of a sell-by or use-by date in lieu of the required date of packing. Therefore, since the pack date\code is mandatory, and a sell-by or use-by date may be used in lieu of the pack date\code, retailers may not modify a sell-by or use-by date on poultry products packaged under Federal inspection. FSIS has no regulations requiring calendar dating on red meat products. However, if a federally inspected establishment has voluntarily placed a calendar date on red meat products, such a date cannot be removed or changed by a retailer. There are likely a number of factors that manufacturers have considered about safety in preparing products and the inclusion of a calendar date that a retailer may not be aware of. Moreover, similar to other labeling features applied at Federally inspected establishments, they should not be removed or modified unless returned and repackaged\reprocessed under Federal inspection. On the other hand, if a food retailer places a calendar date on red meat or poultry products, the retailer may change that date on products that remain wholesome, provided that the change in the date is identified on the label, e.g., "original sell-by date" and "new sell-by date." A local jurisdiction (e.g., a State authority) may, however, have a requirement against changing these dates at the retail level. Lastly, if a product has an expired date and the food remains wholesome, the product may continue to be offered for sale.

Poultry Product Dating -- Frequently Asked Questions

1. Question: What is the general rule about pack dates on poultry food products produced in a federally inspected facility? Answer: FSIS requires all immediate containers or shipping containers of poultry food products to be clearly and permanently marked by code or otherwise with the date of packing. If a calendar date is used, it must be accompanied by a statement explaining the meaning of the date. The calendar date must include the month of the year and the day of the month for all products and also the year in","4 the case of products hermetically sealed, dried, or frozen products, for example, \u201cpacked on May 22, 2005.\u201d For further information, see the regulations at 9 CFR 381.126 (b) and 381.129 (c) (1).
2. Question: What are the definitions of \u201ccconsumer packaging,\u201d \u201cimmediate container,\u201d and \u201cshipping container\u201d in reference to poultry product pack dates? Answer: "Consumer package" is defined in 9 CFR 381.1. A consumer package means any container in which a poultry product is enclosed for the purpose of display and sale to household consumers. Therefore, the consumer

package is synonymous with \"immediate container.\" The immediate container (9 CFR 381.1) includes any consumer package; or any other container in which poultry products, not consumer packaged, are packed. Furthermore, immediate containers are required by 381.116 to bear all required features applicable in Subpart N of 9 CFR, Part 381, in other words, an immediate container is a fully labeled package. In some cases, the immediate container is also the shipping container. 9 CFR 381.116, states that the labeling requirements in that part apply to shipping containers; that is, when the shippers are also the immediate container. However, a true shipper is only required to include the inspection legend, plant number, and a handling statement, if the product is perishable. A true shipping container would always contain fully labeled product inside; thus, there is not a requirement for shippers to be fully labeled.

3. Question: Does the date of pack \u201clabel requirement\u201d apply to fresh, raw product only, OR does it apply to frozen, thawed, partially cooked, or cooked product? Answer: Section 381.126(a) of the regulations applies to all poultry food products not covered by other sections of this regulation. These products require a pack date. Dressed poultry and canned poultry are covered by other paragraphs in that section of the regulations -- 381.126 (b) and (c), respectively. Dressed poultry requires the slaughter date, and canned poultry requires the date of canning or a code to represent the date of canning.

4. Question: What is the definition of a pack date? Answer: The pack date is the date that a product is packaged.

5. Question: How can the pack date be expressed? Answer: Understanding that the immediate containers or the shipping containers of poultry food products must be marked with the original pack date, there are actually four options available for poultry processors to comply with the pack date provisions, one of which must be used. These options are:

- \u2022 a code is applied that represents the original pack date of the poultry food product in the consumer package, or
- \u2022 the original pack date of the poultry food product is applied to the consumer package or the shipping container accompanied by an explanatory statement, e.g., \"packing date\" (per 9 CFR 381.129 (c) (2)), or
- \u2022 the original pack date of the poultry food product is applied to the consumer package or the shipping container along with a date representing when the consumer packages are placed in shippers. In this case, each date must be accompanied by an explanatory statement in accordance with 9 CFR 381.129 (c) (2), e.g., \"packing date,\" and \"date put in shipping container,\" or
- \u2022 the use of a calendar date, e.g., \u201csell-by,\u201d \u201cuse-by,\u201d etc., (per 9 CFR 381.129 (c) (2)) in lieu of the original pack date of the poultry food product is applied to the consumer package or the shipping container.

6. Question: Can a \u201csell-by\u201d or \u201cuse-by\u201d date be used in lieu of the \u201crequired date of packing\u201d? Answer: Yes, in accordance with longstanding FSIS policy, \u201csell-by\u201d or \u201cuseby\u201d dating can be used in lieu of pack dates on poultry food products.

7. Question: How does the \u201csell-by\u201d or \u201cuse-by\u201d date correspond with the pack date? Answer: There is no single, numerical correlation between the pack date and other dates placed on labeling. Manufacturers must determine these dated based on the length of time that their product will remain wholesome.

Updated Question and Answer 8. Question: Can a pack date on a poultry product be changed? Answer: No. The pack date for a poultry food product packaged under Federal inspection can not change unless the poultry product is further prepared or processed, e.g., chopped, smoked, ground, etc. and repackaged. The date that the product is further processed and packaged could then be used as the new pack date. For the purpose of this policy, freezing the product can be considered to be

a further preparation or process. Therefore, a new pack date can be applied to refrigerated poultry food products if they are frozen and repackaged or repackaged and frozen. It is not sufficient to simply freeze product, it must be repackaged as well to change the pack date. Similarly, if a frozen poultry food product is thawed and repackaged, a new pack date can be applied to the product. In this situation, thawed and repackaged product would include the use of the handling statement, \u201cPreviously handled frozen; for your protection keep refrigerated or refreeze.\u201d This is needed to ensure that the labeling of such product is not misleading to consumers.", "6 9. Question: Can retail stores change the sell by\use by dates that a Federal facility applied to labeling? Answer: No. Because a pack date is required for a poultry food product, and a sell-by\use-by date can be used in lieu of the pack date, a retailer cannot change the date applied by the Federal plant unless the poultry product is further processed, e.g., chopped, smoked, ground, and then repackaged. 10. Question: Can the time of day be placed under the pack dates of labels? Answer: FSIS would not take issue if the time of day is placed on the labels under the pack date as long as the pack date complies with FSIS regulations. 11. Question: Does the requirement for pack dates depend on who is receiving the product (consumer vs. HRI)? Answer: No. According to 9 CFR 381.126(a), a pack date is required on either the immediate container or shipping container of all poultry food products. 12. Question: Can raw product that is slaughtered on a particular day and then stored until further processed on a subsequent day be labeled with a \u201cdate of pack\u201d corresponding to the date it was \u201cfurther processed,\u201d e.g., deboned, marinated, cut-up, etc?. Answer: If the product has been further processed, e.g., cut-up, deboned, etc., and then packaged, it is acceptable to use the date of the packaging as the pack date required by 381.126(a). 13. Question: How is product that is slaughtered at one establishment and processed, e.g., cut-up, at a receiving establishment to be labeled (relative to \u201cdate of pack\u201d)? Answer: When the birds are processed and packaged at a second plant, the date of packaging is the acceptable pack date. 14. Question: What is the general rule about slaughter dates on poultry food products produced in a federally inspected facility? Answer: Slaughter dates are only required on dressed poultry. As specified by 9 CFR 381.126(b), \u201cdressed poultry\u201d is to be marked with a lot number which shall be the number of the day of the year on which the poultry was slaughtered or a coded number. \u201cDressed poultry,\u201d for the application of this section of the regulations, is slaughtered, defeathered, eviscerated whole birds with the head and feet removed, i.e., a ready-to-cook whole bird. \u201cDressed poultry\u201d would also include slaughtered, defeathered, whole birds slaughtered under various religious or other exemptions, e.g., Chinese Buddhist exempt poultry that requires the head and the feet remain on eviscerated poultry. Prepared or processed poultry, e.g., "7 cut-up, marinated, breaded, etc., products are not considered to be dressed poultry and fall under subsection (a) not (b) of this regulation. 15. Question: Can the slaughter date and the pack date be the same? Answer: Yes, if the birds are slaughtered, processed, and packaged in immediate containers on the same day. 16. Question: Does the slaughter date have to be on the immediate container of all poultry? Answer: A slaughter date is only required by 9 CFR 381.126(b) on the immediate containers of \u201cdressed\u201d poultry. 17. Question: What is the definition of \u201cdressed poultry?\u201d Does it include ALL raw poultry (whole birds, cut-up parts, giblets, deboned product, marinated product, necks, paws, etc.)? Answer: \u201cDressed poultry,\u201d for the application of this section of the regulations, is

slaughtered, defeathered, eviscerated whole birds with the head and feet removed, i.e., a ready-to-cook whole bird. Prepared or processed poultry, e.g., cut-up, marinated, breaded, etc., products are not considered to be dressed poultry and would be governed under subsection (a) not (b) of 381.126. 18. Question: Frozen dressed poultry (e.g., frozen whole turkeys) are slaughtered on various dates and placed in consumer ready packages prior to being placed in frozen storage. When needed, the establishment removes frozen whole turkeys from frozen storage for shipment. Prior to shipment, the frozen whole turkeys have a price label applied that bears a code. The establishment has documentation to show that the code can be used to identify birds\u2019 date of slaughter. Does this practice comply with the date of packing labeling requirements described in 9 CFR 381.126(b)? Answer: In this case, 9 CFR 381.126(b) specifies that the immediate container for dressed poultry shall bear the number of the day of the year on which the poultry was slaughtered or a coded number. An "explanatory statement" statement as described in 9 CFR 381.126(a) is only required when a calendar date is used. 9 CFR 381.12(c) requires that the Inspector be informed as to the meaning of any coded number that is used. In this case, the code can be linked to the slaughter date through an establishment\u2019s documentation and recordkeeping. Therefore, the code is in compliance with the requirements of 9 CFR 381.126 (b) because it can be linked to the date of slaughter. If the birds are commingled in frozen storage, and the actual slaughter date of each bird cannot be determined, the coded number would have to be linked to the oldest date of slaughter." , "8 19. Question: What is a code date? Answer: A code or code date should be information that has meaning to the manufacturing or packing plant for tracking purposes of a product, specifically, a means of identification of product slaughtered, prepared, processed, or packaged on a certain date in the case of a recall. If the code links to a production date, that is sufficient; that is actually the purpose of the code to identify the date of production or a lot from a specific date. However, codes should not have meaning that is misleading to a consumer. If a plant is using "codes" that appear to be dates, it should revise its coding system or apply the proper use of calendar dating in accordance with 9 CFR 381.129(c). For example, we believe that \u201c051305\u201d and \u201cMay1305\u201d do not represent codes but calendar dates that should be identified properly. A Julian date of \u201c13305\u201d (133rd day of the year 2005) would be considered to be an acceptable code since most consumers would not immediately associate such numbers with a calendar date. New Questions and Answers 20 and 21 20. Question: Can a \u201cuse-by\u201d or \u201ccell-by\u201d date be used in lieu of the slaughter date required on \u201cdressed\u201d poultry as described in 9 CFR 381.126(b). \u201cDressed poultry,\u201d for the application of this section of the regulations, means slaughtered, defeathered, eviscerated whole birds with the head and feet removed, i.e., a ready-to-cook whole bird. Answer: No, a \u201cuse-by\u201d or \u201ccell-by\u201d date may not be used in lieu of the slaughter date. However, the regulations do permit the use of a code to identify the slaughter date. 21. Question: If a plant operates a shift that begins late in the evening and runs past midnight, can the end of the shift, i.e., the next day\u2019s date be used as the slaughter or pack date for the entire shift? Answer: No, it is misleading to use a later date for a slaughter or pack date. Product slaughtered or packed until midnight would have to use the accurate date of slaughter or pack. However, we would permit product slaughtered or packed after midnight to include the date the shift started if a company cannot change dating equipment in the middle of a shift. For additional information about poultry food product

Introduction FSIS-regulated establishments rely on results from pathogen testing programs to comply with regulatory requirements and to support decisions made in their HACCP systems to ensure the production of safe unadulterated products. FSIS does not maintain a list of acceptable methods to be used in these testing programs. However, the Agency's overall expectation is that any test used by an establishment is appropriate for its intended use, that the test performance is comparable to the FSIS method (if applicable), and that the laboratory performing the test did not introduce modifications that could compromise test's performance. FSIS believes that a robust validation study must be performed on any method used by establishments to detect microbiological hazards in FSIS-regulated foods. A validation study is an experimental process to measure performance characteristics of a particular test, with the goal of determining whether the test is equivalent to the reference test. 'Equivalent' is defined as the designated relationship between two tests indicating that, for the intended conditions of use, the performance characteristics are statistically indistinguishable. This guidance document (section II) provides an example of how to design a robust pathogen method validation study that may be used to demonstrate equivalence. The performance characteristics addressed in this guidance are described in Box 1. The guidance provided in this document primarily focuses on measuring relative recovery and sensitivity (false negative rate). Measurement of specificity (false positive rate), inclusivity, exclusivity, repeatability, reproducibility, and ruggedness should be performed through the direction of an independent organization, or by following guidance provided by the AOAC International Official Methods of Analysis Program. The FSIS guidance should be useful to organizations that design or conduct validation studies for foodborne pathogen testing methods. These organizations include test kit manufacturers, laboratories, and independent validation organizations. The FSIS guidance is not intended to conflict with or supplant existing guidance from independent organizations (AOAC and ISO). The FSIS guidance could be used to

evaluate the performance of a candidate alternative method for Escherichia coli O157:H7 or non-O157 Shiga toxin producing E. coli (nonO157 STEC). NOTE: The use of validation in this document is not intended to have any application to the implementation of 9 CFR 417.4(a)(1) on initial validation of HACCP plans. This document deals exclusively with the evaluation of pathogen test kit methods.","FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 3 of 22 Box 1. Performance Characteristics Used to Evaluate Pathogen Test Kit Methods Relative Recovery measures the proportion of true positive samples recovered from the new test compared to the reference test when similarly inoculated. Sensitivity\False Negative Rate measures the probability that a test will correctly detect a true positive sample. A false negative (FN) result occurs when a test does not correctly detect a true positive sample, so 1 minus the sensitivity equals the FN rate. Specificity1\False Positive Rate measures the probability that a test will correctly detect a true negative sample. A false positive (FP) result occurs when a test does not correctly detect a true negative sample, so 1 minus the specificity equals the FP rate. Inclusivity measures the ability of a test to detect a wide variety of strains representing the target pathogen. Exclusivity measures the ability of a test to resist interference by cross-reactivity with non-target organisms likely to be found in the tested food. Reproducibility is a measure of test performance in different laboratories with different equipment and personnel. Repeatability is a measure of test performance in the same laboratory with the same equipment and personnel. Ruggedness testing is performed to determine if small changes to the procedure or environmental factors influences test performance. Validation studies are designed to evaluate the performance of a new test (referred in this document as the alternative method, or A) against a reference method (referred to as R) that provides a definitive result. The typical study design can not be applied to methods which do not have an available authoritative R. Additionally, the study design described in this document (section II) would not determine if the performance of A exceeded R. Validation studies performed through the Association of Analytical Communities (AOAC) or other recognized independent organizations that perform or organize validation studies on behalf of test developers, follow the traditional design and rely on culture based reference methods. FSIS believes that any method used to detect foodborne pathogens in meat, poultry, and egg products should be as sensitive as the FSIS method. Other recognized cultural methods, fit for the purpose of detecting low levels of stressed cells in food, also may be an appropriate reference method. Alternative methods should be re-validated when significant changes affecting performance are introduced to the reference method. Re-validation should be performed within one year of the introduced changes. 1 Also referred to as Selectivity.","FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 4 of 22 From a food safety perspective, methods to detect foodborne pathogens should be validated using a robust study design with special attention to sensitivity (false negative rate) and inclusivity to limit or prevent false negative results. From an economic perspective, methods should be validated with special attention to specificity and exclusivity to prevent or limit false positive results and to reduce the time to obtain results, thus allowing product disposition to be rapidly determined. Sensitivity, specificity and timeliness are related, so an increase in one parameter may lead to a reduction of the other. Robust validation methodology implies that A should be evaluated under the most challenging conditions to provide confidence that the method likely will perform well under most situations. In practical terms, a robust validation methodology should address the following

parameters: 1. The inoculum level should be low enough to achieve fractional recovery of positive results by R. In FSIS\u2019 experience, pathogens subjected to zero tolerance testing in meat, poultry, and egg products often are found at low levels, close to one viable organism per analytical unit. Because it is practically impossible to place a single organism in a testable unit of food, the best approach taken in validation studies is to inoculate foods at low levels so that a fraction of the analyses (defined as 20-80% of the inoculated samples analyzed by R) are confirmed positive for the target pathogen. \u201cFractional recovery\u201d is a well-established concept used by AOAC and other organizations performing validations, and was recognized as a preferred method for defining test performance by the Presidential Task Force for Best Practices in Microbiology<sup>2,3</sup>. 2. The study should evaluate the ability of the test to detect potentially stressed or injured cells. Foods prepared for commercial distribution often are exposed to conditions injurious to bacterial contaminants. Foods often are processed at reduced temperatures to prevent pathogen growth and avoid spoilage. In other situations, food properties are modified by the application of antimicrobial agents such as organic acids, salt, curing agents, or other preservatives or by the modification of pH and water activity. In addition, the presence and level of resident microflora in the sample, (which is related to the age and handling of the product sample) could interfere with target pathogen growth. Any of these treatments may negatively affect the growth properties of the target pathogen, by extending lag phase or exponential growth rate. Injured cells would be more difficult to detect, but could retain their ability to cause illness. 3. The study should evaluate the ability of the test to detect target organisms in the products likely to be tested; however, foods that present a challenge to the test\u2019s performance should be evaluated, even if they are not as likely to be tested. 4. The study should evaluate a target strain with limited growth potential in the product to be tested; this would present a challenge to the sensitivity of the test kit.

2 Feldsine et al., AOAC INTERNATIONAL Methods Committee Guidelines for Validation of Qualitative and Quantitative Food Microbiological Official Methods of Analysis. Journal of the AOAC International 85(2): 1187-1200. 3AOAC International Presidential Task Force, Best Practices in Microbiological Methodology (August 10, 2006), accessed at:  
<http://www.fda.gov/Food/ScienceResearch/LaboratoryMethods/ucm124900.htm>, "FSIS Guidance for Evaluating Test Kit Performance 10/15/10 Page 5 of 22

5. The study should evaluate the test\u2019s performance against a cultural method. For most FSIS-regulated products, the current FSIS method, found in the microbiology laboratory guidebook (MLG), is the most appropriate reference cultural method<sup>4</sup>.

6. The study should evaluate a sufficient number of samples. The number of samples should be chosen to provide adequate statistical assurance that a false negative conclusion will not be reached (i.e., that A and R were equivalent when, in reality, the methods were not equivalent). This guidance document in section II provides a robust validation experimental design that addresses the above mentioned parameters. The document can be used by test kit developers, laboratories, or independent validation organizations to determine whether a new alternative method A would be appropriate for testing programs conducted in FSISregulated establishments. Two criteria should be considered:

1. Demonstration that recovery rates for A and R are statistically indistinguishable using an unpaired trial with fractional recovery of positive results<sup>5</sup>.
2. Evaluate the sensitivity of A using a paired trial and a minimum of 29 positive samples. FSIS will use these data to evaluate a manufacturer\u2019s claim that a new method was equivalent to a

reference method, including the FSIS method.<sup>4</sup> When minimal changes have been introduced, validation against a non-cultural method may be appropriate.<sup>5</sup> A different study design would be needed to demonstrate that recovery rates for A were superior to R. This situation is not addressed in this guidance document.", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 6 of 22 II. General Guidance for Evaluation of Pathogen Test Kit Performance The following guidance is provided to assist the design of effective validation studies that are likely to meet FSIS\u2019 expectations.

**1. Purpose, Scope and Audience**

This guidance document is intended to assist the design of validation experiments for methods used to detect bacterial pathogens in matrices such as meat, poultry, and egg products, and environmental samples (sponges, swabs, brines). In particular, the document could be used to evaluate the performance of a candidate alternative method for *E. coli* O157:H7 or non-O157 Shiga toxin producing *E. coli* (non-O157 STEC) strains. The document is not applicable to methods for enumerating microorganisms. This guidance document focuses on procedures to measure sensitivity (and false negative rate), specificity (and false positive rate), and to compare positive recovery rates for an alternative and reference method (abbreviated as A and R, respectively). These measures of test performance should be evaluated when any modification is introduced to A, including, for example, changes to test portion size, enrichment media, enrichment time, enrichment temperature, sample to media ratio, or test matrix. If a major modification is introduced to A, then Inclusivity, Exclusivity, Repeatability, Reproducibility and Ruggedness Testing should also be performed, either through the direction of an independent organization, or by following guidance provided by the AOAC International Official Methods of Analysis Program<sup>2</sup>. A major modification to A would include significant changes in the design or the component reagents for a screening test, for example, the introduction of a new antibody or oligonucleotide primer. This guidance document is not intended to conflict with or supplant existing guidance from independent organizations (AOAC and ISO), and is not intended to have any application to the initial validation of HACCP plans described in 9 CFR 417.4(a)(1). The intended audience for this document includes test kit manufacturers, laboratories as well as independent organizations that evaluate test kit performance.

**2. General Considerations**

The work should be carried out in a laboratory that is independent of the manufacturer\u2019s economic interest. For example, the study may be carried out under contract to an academic laboratory, or a publicly-, or privately-owned laboratory that is not controlled by the test manufacturer. Alternatively, the validation may be performed through an independent organization such as AOAC, AFNOR, ISO, or NordVal. To avoid handling bias, the identity of the samples should be blinded to the analysts. The study design should be reviewed by an outside party before initiating work. FSIS can review and comment on study design<sup>6</sup>. Finally, all study reports as well as the associated raw data should be available for review by FSIS.

**6 Submit proposals for FSIS comment through the sampling queue at askFSIS (<http://askfsis.custhelp.com>).** ", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 7 of 22

**3. Inoculum Number of strains:** The number of strains to be used for inclusivity and exclusivity studies is referenced in the AOAC guidelines<sup>2</sup>. Experiments to determine method equivalence should be conducted under conditions that result in fractional recovery of positive samples. Therefore, the use of multiple strain cocktails is not recommended, because individual strains would segregate to different samples.

**Strain selection:** Strains used to measure test performance should be available from public collections (e.g., ATCC, DSMZ, JCM), academic

government reference laboratories, or other collections that are available to the scientific community. For inclusivity and exclusivity studies, the strain set should include strains that do and do not meet the FSIS regulatory definition based on the current FSIS MLG method (Table 1). For validation of test performance characteristics, the target strain should be associated historically with the matrix, or an outbreak. These should be the first strains of choice for conducting the validation study. Strains demonstrating reduced growth potential in particular matrices also should be chosen to challenge the validation. A validation experiment using a challenging target strain would provide additional information on the robustness of the alternative procedure. If FSIS had evidence that certain strains or serotypes consistently were not detected by a commercially available method, it may request additional validation data. Recommendations for typical strains of *E. coli* O157:H7, *Listeria monocytogenes*, *Listeria* species, and *Salmonella* strains are provided in Table 1. FSIS welcomes recommendations for typical and challenging strains to be considered for validation studies in specific meat, poultry, egg product, and environmental matrices.

**Inoculum preparation:** To insure the purity of the target strain, a single, isolated colony is picked from a non-selective plating medium. For experiments to determine method equivalence, the isolated colony is used to inoculate an appropriate liquid medium, and it is incubated until the culture reaches stationary phase. Following incubation, the stationary phase culture should be cold-stressed ( $4^{\circ}\text{C}$ , 18-24 hours).<sup>7</sup> After 24 hours at  $4^{\circ}\text{C}$ , the culture can be diluted and plated on a non-selective medium to determine colony forming units per milliliter (CFU/mL). Sufficient measurements should be made to determine that the target strain is uniformly distributed in the culture to ensure that the inoculum in the tested samples is distributed as a Poisson distribution. These results should be reported. The 24 hour CFU/mL value can be used to determine the volume of inoculum to be added to the matrix to achieve the desired target strain concentration.

Alternatively, the target strain level in the inoculated matrix can be estimated by most probable number (MPN) analysis. FSIS welcomes recommendations for alternative procedures for preparing target strains for validation experiments and for inoculating test matrices.<sup>7</sup> This is a minimum recommendation for stress conditioning of the inoculum. The study design should consider the typical conditions used to manufacture the matrix of interest at the typical point of sampling. These may include temperature extremes, salt, water activity, pH, or the presence of residual antimicrobial compounds like organic acids. In some cases, the inoculum can be exposed to extreme conditions simply by exposure to the test matrix.<sup>7</sup> "FSIS Guidance for Evaluating Test Kit Performance 10/15/10 Page 8 of 22

**Inoculation of the matrix:** The inoculation level should be sufficient to result in fractional recovery of positive samples per test portion, defined as a range of 20-80% confirmed positive results for R. The inoculation level merely refers to the average level of target organism delivered to each test portion that would result in fractional recovery of positive results. The level may be different based on the choice of R or target organism, and higher inoculation levels may be required if the fractional recovery rate does not meet the recommended range. If possible, the matrix should be well mixed before inoculation to reduce potential variation in composition including intrinsic interfering factors. For example, high fat (e.g., 50% lean) beef trim can be sliced into small pieces or ground to distribute the fat and background microflora before inoculation. The experimental portions should be prepared and inoculated with the necessary volume of inoculum preparation to ensure the inoculum is well distributed. If a multicomponent product is to be

evaluated, the non-FSIS and FSIS-regulated components should be likewise well distributed before inoculation. If multiple portion sizes are to be evaluated, a portion of the matrix can be inoculated at X CFU per 25 grams, and then 25 gram portions of inoculated matrix are combined with additional, uninoculated matrix to create alternative portion sizes containing X CFU per portion. For validation of environmental testing methods, the inoculum may be added directly to the collection device (swab or sponge). However, the typical conditions of use should be simulated including the presence of competitive microflora. For example, before adding the inoculum, the device should be used to swab a surface. The device and inoculum should be combined with sample collection media before enrichment. The same concept of low level inoculation and fractional recovery apply to the validation of tests for environmental samples. A number of samples (5-10 per trial) should be uninoculated to serve as negative controls.

4. Matrix Choice of Matrix: Validation studies should use matrices typical of the samples likely to be tested. Food matrices can be mixed before inoculation and enrichment to reduce potential for experimental variation. The choice of the matrix and the decision to initiate a validation study for a new matrix should be based as much as possible on the intrinsic properties of the matrix that are likely to affect the growth of the target pathogen. These properties include: levels of indigenous microflora, fat content, pH, salt content, water activity, the presence of antimicrobial compounds including additives found in ready-to-eat products, and the presence of residual antimicrobial compounds typically used for treating environmental surfaces or raw products. The intrinsic properties should be evaluated at a location in the process when the sample is likely to be collected. For example, beef trim is typically sampled after fabrication, so a validation study intended for beef trim should use trim collected at that point. Primal cuts purchased at retail would not be a suitable substitute. Similarly, a *Salmonella* test intended for raw egg yolk may not be suitable for testing pasteurized egg yolk product containing additives that may interfere with *Salmonella* growth. A scheme for determining meat, poultry, and egg matrix categories based on water, fat, spice, salt, or sugar content, and cooking was created by the Presidential Task Force on Best Practices in Microbiological Methodology (BPMM)3.

Additional factors described above should be considered as well. Examples", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 9 of 22 illustrating this concept are found in Box 2. Tables 2a and 2b provide some examples of matrix categories for FSIS-regulated meat, poultry, and egg products. Box 2. Decision Criteria Illustrating When New Validation Studies Should be Conducted for an Existing Method A commercially available test for *E. coli* O157:H7 was AOAC-validated for ground beef products. The test matrix was 80% lean ground beef. Customers would like to use the test for lean beef trim of comparable fat level. There is no need to re-validate the test for this matrix, since there is minimal difference in fat content, an important intrinsic property that may affect test performance. No other intrinsic properties (such as residual antimicrobial compounds) distinguish these matrices. Customers want to use the above mentioned test for 50% lean trim, a validation experiment should be designed for this matrix since the fat content is significantly different and may affect test performance. A commercially available test for *Listeria monocytogenes* was validated for ready to eat turkey roll with 5% salt added. It was concluded that there is no need to revalidate the test for use with low fat beef hot dogs because the fat and salt content were similar and are not expected to have a differential effect on test performance based on comparative information about growth kinetics within turkey and beef matrices. However, use of the test with dry fermented

salami would require additional validation because the reduced water activity and presence of added microbial flora (lactic acid bacteria) in the salami could affect test performance. The above mentioned *L. monocytogenes* test should be validated for use with sponge samples collected from environmental surfaces. Characterization of matrix: Intrinsic properties of concern for the specific matrix (e.g., APC to evaluate microbial flora, water activity, pH, antimicrobial residues or additives) should be measured in the material chosen for the study, and the values should be compared to published or unpublished ranges for the product type. The values (as well as the methods for determining the values) should be presented in the study report or should be otherwise available for review by FSIS.

## 5. Study Design and Analysis.

**Paired and Unpaired studies:** Validation studies should measure performance characteristics of an alternative method (A) relative to a reference method (R). Figure 1 illustrates validation study designs. Microbiological methods typically involve sequential sample preparation and enrichment, screening, and confirmatory procedures. Figure 1 depicts these procedures using the numbers P, S, and C respectively. For example, AP refers to the alternative sample preparation and enrichment procedure, while RP refers to the sample preparation and enrichment procedures indicated in the reference method. AC refers to the reference confirmatory procedure applied to A.," "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 10 of 22 Validation studies should rely on two components to determine the equivalency of A and R: relative recovery and sensitivity (false negative rate). FSIS believes that the recovery A and R should be statistically indistinguishable, and that a robust estimate of sensitivity should be determined. FSIS has not determined that a specific sensitivity criterion is appropriate for all situations. Manufacturers should evaluate sensitivity estimates on a case by case basis. Test kit manufacturers can use this guidance document to evaluate sensitivity for a test kit, or to demonstrate that a test kit met a specific sensitivity criterion. Two study designs in Figure 1 illustrate how relative recovery and sensitivity are determined and calculated. An unpaired study design is intended to compare the recoveries of A and R. It is performed using independent samples that are randomly assigned to either the A or R procedure8. A paired study design is intended to measure the sensitivity of A9. The paired study is performed by taking two or more measurements from the same sample to which A is applied10. Evidence from both unpaired and paired studies is used to evaluate a manufacturer\u2019s claim that a new method was equivalent to a reference cultural method, including the FSIS method. 8 Care must be taken to avoid biased selection of samples for the A or R protocol. 9 Specificity (false positive rate), can also be estimated using a paired experiment as the ratio of negative tests at AS divided by AC. 10 For example, a sample is prepared by the A method and is sampled after 15 hours of enrichment with AS (the alternative screening test) and AC (the reference confirmatory procedure).," "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 11 of 22 Figure 1. Validation Experiment Design. A is the alternative method, R is the reference method. P is the sample preparation and enrichment procedure, S is the screening procedure, and C is the reference confirmatory procedure. AC refers to the reference confirmatory procedure applied to A. RS refers to a screening procedure applied to R. In an unpaired trial, recovery (% positive) at AS is compared to recovery at R2. Results at AS should be confirmed at AC, and recovery at RC and AC should not be statistically distinguishable. In a paired trial, a false negative or false positive rate is calculated as the ratio of positive tests at AS divided by AC.

**Data Analysis.** Data analysis from an unpaired study typically involves a comparison of recovery

rates (proportion of positive results) at AS and RC, but only if fractional recovery is achieved. In other words, the proportion of positive samples using A is compared to the proportion of confirmed positives using R. Because some of the AS results may in fact be false, all AS results used in this comparison are confirmed (AC). A simple Pearson chi-square test without continuity correction should be used to determine if the recovery rates from the two procedures are statistically distinguishable. The associated P-value for significance (alpha) provides the probability that the methods are found not to be equivalent by chance, assuming the true proportions were identical. FSIS\u2019 concern is that the performance of A should not be inferior to R. Therefore, the statistical test should decide between the null hypothesis (that is, the performances of A and R are identical) and the alternative hypothesis (that the performance of A is inferior to R). Thus, a 1-sided statistical test should be used. By convention, alpha is set to 0.05 (meaning that there is a 5% probability that the statistical evidence would lead to accepting the alternative hypothesis when in fact the null hypothesis is true). A Pearson chi-square test without correction factors is recommended because this method is commonly used for statistical testing and does not rely on access to, or knowledge of, sophisticated computer programs that may not be available to all<sup>11</sup> (see attachment). The Pearson Chi square statistic is made using the familiar  $(O-E)^2/E$  formula: where O is the observed result, E is the expected value of the result, assuming the truth of the null hypothesis, summing over the 4 cells of a 2 x 2 table that has entries equal to the number of positive and negative results for the two methods. The expected value under the null hypothesis is the average of the two corresponding method specific results. The statistical significance (p- value) of the result of this calculation is equal to the<sup>12</sup>, "FSIS Guidance for Evaluating Test Kit Performance 10/15/10 Page 12 of 22 one-sided chi-square test at an alpha of 0.05 is essentially the same as the two-sided chisquare at an alpha of 0.10. Thus, rejection of the null hypothesis and acceptance of the alternative hypothesis occurs when the chi-square statistic exceeds 2.7055 and the number of positive results for R is greater than that for A. Data analysis from a paired study involves a comparison of paired results from the same sample determined by AS and AC. Sensitivity and specificity are determined from the ratio of AS to AC for positive results (to determine sensitivity) or for negative results (to determine specificity)<sup>12</sup>. These ratios are point estimates, and unless a large number of samples test positive or negative, the associated confidence intervals would be very wide, and would be used to provide a robust estimate of sensitivity or specificity (see below for discussion of sample size). FSIS Levels of validation. FSIS believes that all alternative methods should be validated using robust studies such as those described above. However, the Agency realizes that modifications to methods may not always require the same level of validation. Therefore, FSIS proposes four levels of validation that may be appropriate for some circumstances (Figure 2, Table 3). Note that a minimum of 60 samples per method are recommended for all levels. FSIS level 1 validation includes unpaired and paired studies, and all samples are confirmed using the reference confirmatory procedure (RC for R or AC for A). Level 1 is recommended for any novel A, or when a major modification, or two or more non-major modifications are introduced to A (e.g., new matrix, new screening test, or new enrichment broth). Comparison of recovery of the screening device with the A and R methods is optional. FSIS level 2 validation could be used when a single non-major modification is made to A. Like level 1, level 2 also includes an unpaired and paired study, but would allow a screening test to substitute for the full reference

method. This screening test (referred to as RS) would be recommended only if the performance is determined using a level 1 validation. In this situation, the apparent equivalency of A is determined by comparing recovery rates for AS with RS FSIS level 3 validation could also be used when a single non-major modification is made to A. Level 3 only includes an unpaired study, and would allow substitution of a screening test (AS and RS) for confirmed results provided that the same screening test was used for A and R, and the performance of AS and RS were determined using level 1 validation. Level 2 is preferable to level 3 validation. FSIS level 4 validation would be appropriate only when a full reference method does not exist. Level 4 only includes a paired study in which recovery at AC and AR is compared. probability that a chi-square-distributed random variable (with 1 degree of freedom) exceeds the result. The attachment describes how the Pearson chi-square test statistic is calculated. 12 Unlike the paired experiment, AS results are not corrected by AC results.", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 13 of 22 Figure 2. FSIS levels of Validation. A is the alternative method, R is the reference method. P is the sample preparation and enrichment procedure, S is the screening procedure, and C is the reference confirmatory procedure. AC refers to the reference confirmatory procedure applied to A. RS refers to an alternative screening procedure applied to R. In an unpaired trial, recovery (% positive) at AS is compared to recovery at R2. Results at AS should be confirmed at AC, and recovery at RC and AC should not be statistically distinguishable. In a paired trial, a false negative or false positive rate is calculated by comparing results at AS and AC. Comparison of recovery by RS and AS is optional for FSIS level 1 validation. Reference method: For FSIS regulated products, the current FSIS method, which is found in the Microbiology Laboratory Guidebook (MLG), is the most appropriate reference cultural method for validating methods used by FSIS-regulated establishments. Other cultural methods also may be appropriate, including methods described in FDA\u2019s Bacterial Analytical Manual (BAM), or reference methods defined by the International Standards Organization (ISO), or the Codex Alimentarius. In certain circumstances, as indicated in Table 3 and figure 2, a non-cultural method may be appropriate for validation studies when minimal changes have been introduced to A, and the non-cultural method is well-defined (see Levels of Validation). Alternative methods should be revalidated when significant changes affecting performance are introduced to the reference method. Re-validation should be performed within one year of the introduced changes. 6. Sample size To provide robust estimates of method equivalency, as well as estimates of sensitivity and specificity, sample size needs to be addressed. Unpaired studies: The number of samples tested per method, the anticipated recovery rates, and the confidence level (alpha), are used to calculate statistical power, defined as the probability of detecting a true difference between A and R. That is, the number of samples that would provide high probability of detecting a difference in the recovery rates of A and R. FSIS calculated statistical power for experiments with different sample", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 14 of 22 sizes and underlying differences in recovery rate13. In these calculations, FSIS assumed alpha to be 0.05, and a 50% recovery rate for R. Figure 3 presents calculated statistical power as a function of A and R recovery rates and sample size. FSIS would not accept as equivalent a candidate A performing at 50% relative to R. In other words, the recovery of R is 50% and that of A is 25%. Thus, in this scenario, there should be a high probability of rejecting the null hypothesis and accepting the alternative hypothesis. For an experiment with N = 20 (i.e., 20 samples tested per method), the

power is 49.5%. That is, in over one-half of the experiments, the null hypothesis would not be rejected and the recovery rate for A and R would be judged as indistinguishable. If N = 40, the power is 75.4%, an almost 25% chance of not detecting what FSIS would consider to be a large difference between the recovery rates of A and R. When N = 60, the power is 89%, almost 90%; that is, an almost 9:1 odds of detecting such a true difference; for N = 80, there is a 95% power, that is, about a 19:1 chance of detecting the difference. For these reasons, FSIS recommends a minimal sample size of 60 per method (and preferably 80 samples per method) to determine robustly if the recovery rates of A and R are indistinguishable. 13 Using PROC POWER procedure of SAS\u00ae version 9.1","FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 15 of 22 Figure 3. Statistical Power as Determined by Sample Size, Recovery Rate, and Minimal Difference between the Alternative and Reference Methods. Statistical power was calculated using PROC POWER program of PC SAS\u00ae version 9.13, assuming 50% recovery rate for the reference method, 10% significance (i.e., a 1-sided test with 5% significance), and 5-45% reduced recovery for the alternative method compared to the reference method. The probability of determining that the methods are statistically distinguishable is shown. Paired studies: As indicated above, a large number of samples would be needed to provide a robust estimate of sensitivity. FSIS recommends that validation studies include a large number of paired trials of A that confirm positive by AC. Figure 4 shows the probability of finding at least one false negative result among 12 to 50 confirmed positive samples assuming a hypothetical alternative test with 90% sensitivity (i.e., a 10% false negative rate). There should be a high level of assurance that the validation study would detect at least one false negative result from this hypothetical test. The curve indicates that 29 or greater positive samples would provide high (95% or higher) assurance that at least one false negative result would be detected from the hypothetical test. Zero false negative results from 29 confirmed positives would be consistent with a test having a sensitivity that met or exceeded 90% and zero negative results from 50 confirmed positives would be consistent with a test with a sensitivity that met or exceeded 94%.","FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 16 of 22 These calculations are provided for illustrative purposes; FSIS has not determined that a specific sensitivity criterion is appropriate for all situations. The key point is that a larger number of confirmed positive samples provide greater assurance of detecting an unacceptable false negative rate. Figure 4. Probability of Finding at Least One False Negative Result for a Hypothetical Test with a 10% False Negative Rate Versus Number of Samples. Twenty-nine samples provide 95% probability (confidence) of detecting at least 1 false negative with this test. 7. Study Report Preferably, validation study reports should be published in an appropriate peer-reviewed journal, such as the Journal of the AOAC International. In any case, a study report containing experimental details and format similar to a scientific article format should be provided to FSIS for review. This would include abstract, introduction, materials and methods, results, discussion, and references sections. For new methods or modifications to existing methods that have not been validated by a recognized independent body, a study report and all associated raw data should be available to FSIS for review. Any recommended changes to the validated test protocol should be communicated as soon as possible to new and existing end users as part of a package insert, on the manufacturer\u2019s web site, and in the manufacturer\u2019s technical literature.","FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 17 of 22 Table 1. Typical and Challenging Strains for use with Validation

Studies.", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 18 of 22 Table 2a. A is the alternative method, R is the reference method. S is the screening procedure, and C is the reference confirmatory procedure. AC refers to the reference confirmatory procedure applied to A. RS refers to an alternative screening procedure applied to R. In an unpaired trial, recovery (% positive) at AS is compared to recovery at R2. Results at AS should be confirmed at AC, and recovery at RC and AC should not be statistically distinguishable. In a paired trial, a false negative or false positive rate is calculated by comparing results at AS and AC.", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 21 of 22 Attachment: Example of Pearson Chi-square Statistic Calculation for Unpaired Samples The results of a fractional recovery experiment can be given in a table, represented in Table A-1. Table A-1: Representation of Results A, B, C, and D from a Fractional Recovery experiment. Alternative Reference Positive A C Negative B D Percent Positive  $100\% \frac{A}{(A+B)}$   $100\% \frac{C}{(C+D)}$  For example, suppose 60 samples are inoculated at fractional recovery and tested using the reference method (R) and 46 are determined to be positive using the reference confirmatory procedure (RC). Another 60 samples are inoculated and tested with the alternative method (A), and 37 are determined to be positive using the alternative screening test (AS) and are confirmed subsequently using the reference confirmatory procedure applied to the alternative method (AC). Table A-2 depicts the hypothetical results. Table A-2: Hypothetical Results of a Fractional Recovery Experiment.

Alternative Reference Positive 37 46 Negative 23 14 Percent Positive 61.7% 76.7% Calculation: The Pearson chi-square test statistic formula is popularly known as the sum of terms  $(O-E)^2/E$ , where O is the observed number of results in the cell; E is the expected number of results in the cell when the null hypothesis is true. The sum of these terms over all cells of the table that contain the results (Table A2) gives the value of the chi-square statistic. The expected numbers of results in the cells, E, are calculated under the assumption that the null hypothesis is true. The null hypothesis states that the recovery of positive results by the two methods is the same. The \u201cxpected\u201d numbers of positive results in the four cells are shown in the following table as expected cell values E(A), E(B), E(C), and E(D), if two procedures have the same fractional recoveries. Table A-3: Expected Number of Cell-Specific Results, E, used in the Calculation of the Chi-Square test, based on Table A1-1. Alternative Reference Positive  $(A+C)/2$   $(A+C)/2$  Negative  $(B + D)/2$   $(B + D)/2$  Percent Positive  $100\% \frac{(A+C)}{(A+B+C+D)}$   $100\% \frac{(A+C)}{(A+B+C+D)}$ ", "FSIS Guidance for Evaluating Test Kit Performance 10\15\10 Page 22 of 22 In the example given above the table of expected values are given in Table A-4. Table A-4: Expected Number of Cell-Specific Results, E, based on Actual Results in the Example, given in Table A1-2. Alternative Reference Positive 41.5 41.5 Negative 18.5 18.5 Percent Positive 69.2% 69.2 The chi-square statistic is computed as the sum of the terms  $(O-E)^2/E$  over the four cells of the numbers of results, as shown in formula (1). Formula (1):  $\text{Chi-sq} = (A-E(A))^2/E(A) + (B-E(B))^2/E(B) + (C-E(C))^2/E(C) + (D-E(D))^2/E(D)$  For the example:  $\text{Chi-sq} = 0.48795 + 1.09459 + 0.48795 + 1.09459 = 3.16509$  Note: Because of the symmetry of the calculations for A and R, it is only necessary to compute the first two terms. A simpler equation can be used, as shown in formula (2). Formula (2):  $\text{Chi-sq} = (A-C)^2/(A+C) + (B-D)^2/(B+D)$  (2) For the example:  $\text{Chi-sq} =$

(9)2\83 + (9)2\37 = 0.9759 + 2.1892 = 3.1651 The Pearson chi-square result of 3.1651 is greater than the cut-off value and the number of positive results for R is greater than that for A. Thus, the null hypothesis is rejected, and thus, based on these results the recovery of A and R cannot be considered the same."}],{"file\_name":"FSIS\_GD\_2013\_0016","title":"Guidance on the Procedures for Joint FSIS and Food and Drug Administration (FDA) Approval of Ingredients and Sources of Radiation Used in the Production of Meat and Poultry Products","num":"FSIS-GD-2013-

## Systems Used for Creating Video or Other Electronic Monitoring or Recording Records

Maintenance and Retention of Records Generated Using Video or Other Electronic Monitoring or Recording Equipment\u2026\u2026\u2026\u2026\u2026\u2026.page 12","3 I. Purpose This compliance guide was written in response to U.S. Department of

Agriculture's Office of the Inspector General (OIG) recommendations (December 2008) to provide information to industry on the use of video or other electronic monitoring or recording equipment to help it maintain compliance with federal regulations, including humane treatment of livestock and the use of good commercial practices in poultry. This document includes recommendations rather than regulatory requirements. FSIS is providing this guidance to advise establishments that video or other electronic monitoring or recording equipment can be used in federally inspected establishments. This guide informs establishments of the Agency's expectations if they decide to use this type of equipment to create records to meet requirements of the Hazard Analysis of Critical Control Points (HACCP) regulations or the regulations governing Sanitation Standard Operating Procedures (Sanitation SOPs) or associated prerequisite programs. In addition, this guide provides information on issues establishments should consider if they use this equipment for any other purpose, such as part of their food defense plans. Most importantly, this guide provides information and encourages industry to use this technology, particularly as part of its systematic approach to ensure that livestock are handled humanely and that poultry good commercial practices are followed.

Although FSIS recognizes that the use of video or other electronic monitoring or recording equipment may assist establishments in meeting federal requirements or for other purposes it cannot be used in a manner to harass, intimidate or interfere with FSIS Inspection Program Personnel (IPP) in the performance of their duties. II. Background Video or other electronic monitoring or recording technology is rapidly changing to meet increasing needs of businesses to become more efficient, increase productivity, and maintain security. Before the 1990s, traditional video technology was analog-based and was used for simple surveillance of premises with a closed circuit television camera and a video cassette recorder (VCR). With the VCR this video system could preserve information (or evidence) which allowed review of past events captured on the video. Further developments improved video capabilities and their applications, but the most revolutionary change, enabled by Internet and local area network

(LAN) availability, was full digitization of both camera and recorder. In these digital video surveillance systems, a digitized camera signal travels over a LAN line to a computer or server. The server or computer in turn manages and analyzes all incoming information resulting in an array of capabilities. A fully digitized system can encrypt data and integrate with other systems or multiple locations. It can retrieve data from remote locations, and use software that enhances or,"4 manipulates images for better viewing and detection of adverse events. It can also direct the video surveillance cameras on-site to detect specific criteria developed to measure process control or compliance. One application of a system of this type in the food industry is video auditing. This application allows the operator to select criteria or risk areas for video monitoring from a remote location to determine whether the selected activities or procedures are indeed taking place. This application is called remote video auditing (RVA). These types of systems, from early traditional to fully digital, are forms of electronic records if they provide permanent evidence or information about past events as do other electronic recordings, such as data loggers or continuous recording devices.<sup>1</sup> However, \u201clive feed video\u201d from a surveillance camera would not be a record if it is not recorded or maintained.

**III. Recordkeeping Requirements for Video or Other Electronic or Recording Equipment**

When video or other electronic monitoring or recording equipment provides permanent evidence of or information about past events, an electronic record is created. Electronic records may substitute for paper and handwritten records and are subject to the same statutory and regulatory requirements. As with paper records, video or other electronic monitoring or recording records may be designated as a record to meet HACCP and Sanitation SOP requirements or may be used for other purposes, such as Food Defense plans. Records not designated for HACCP or Sanitation SOPs are not subject to 9 CFR Parts 416 or 417 recordkeeping regulations; however, any monitoring or verification activities that have an impact on the hazard analysis are subject to 9 CFR Part 417. Additionally, FSIS may request access to all applicable establishment records in the event of an official investigation related to issues such as food defense, food safety, unlawful actions, or provisions of 9 CFR 320. For example, if potential product tampering has been detected, FSIS may request access to an establishment\u2019s recordings used in carrying out their Food Defense plan in the course of that investigation. The FMIA (21 USC 642), PPIA (21 USC 460(b)), and Egg Products Inspection Act (EPIA) (21 USC 1040) contain broad authority requiring certain classes of persons, firms, and corporations in the meat, poultry, and processed egg products business to maintain and provide FSIS with access to records related to their operations. Recordkeeping requirements apply to persons, firms, and corporations that prepare, freeze, pack, label, buy, sell, transport, store, and import meat food products (21 USC 1). Other digital imaging include the following: scanning (bar code scanners); software for scanning items; storage media, such as magnetic or optical disks; programs that can convert images into text-searchable files such as optical character recognition programs; indexing software, for making images more accessible; and storage devices, such as CD jukeboxes or hierarchical storage management (HSM) systems."<sup>5</sup> 642(a) (1), (2)). The statutes require that these businesses maintain production records, bills of sale, invoices, shipping and receiving records, and related business records.

**IV. Use of Video or Other Electronic Monitoring or Recording Equipment to Verify Livestock Humane Slaughter Activities or Poultry Good Commercial Practices**

FSIS encourages federally inspected establishments to consider using video or other electronic monitoring or recording equipment

as part of an overall systematic approach to maintain humane handling or good commercial practices to comply with regulatory and statutory requirements.<sup>2</sup> FSIS encourages establishments to use video technology not as a substitute, but as a supplement to enhance their hands-on activities. The use of video technology should be effectively implemented to result in trustworthy and accurate information that helps to prevent inhumane treatment or inadequate good commercial practices. Video or other electronic monitoring or recording equipment provides an establishment with continuous information on what is occurring with humane handling, instead of relying on periodic observations or spot checks. Establishments should strategically place cameras to provide continuous multi-dimensional views of an establishment's processes, such as from unloading through stunning. Some systems can bring together information in regards to humane handling, food safety, compliance, and product quality at one time. Thus, video or other electronic monitoring or recording equipment can provide new information for establishments to improve process control, as well as to provide feedback for employee training. A type of video or other electronic monitoring or recording equipment that has been developed specifically to verify humane handling or good commercial practices is RVA. In a RVA system the video feed or recording from cameras placed to continuously monitor critical live animal handling and stunning areas, is linked through a computer server to allow the records to be viewed on the web at a remote location by an auditor. The auditor views the video daily and generates reports, containing statistical summaries, web hyperlinks to the video and still images captured through the RVA systems. Such systems may also supply immediate notification to the establishment when pre-determined activities or increased incidences of activities occur. Establishments may determine that the records from using video or other electronic monitoring or recording equipment can help them develop and maintain a systematic approach to humane handling and good commercial practice. The systematic approach means one in which establishments focus on treating livestock or poultry in such a *Humane Handling and Slaughter Requirements and the Merits of a Systematic Approach to meet such Requirements*,<sup>6</sup> (69 FR 54625, September 9, 2004) and *Treatment of Live Poultry Before Slaughter*<sup>7</sup> (70 FR 56624, September 28, 2005).<sup>8</sup> "6 manner as to minimize excitement, discomfort, and accidental injury for the entire time that live livestock or poultry are held in connection with slaughter. The systematic approach involves specific steps (four in livestock and three in poultry) to ensure that there is an integrated approach to humanely handling the animals and good commercial practices in poultry. The steps are: 1. Identify where and under what circumstances livestock may experience excitement, discomfort, or accidental injury while being handled in connection with the slaughter process. Assess circumstances in which poultry may experience excitement, discomfort, or accidental injury while being handled. 2. Design facilities and implement practices that will minimize livestock discomfort and injury in accordance with existing regulations. Take steps to minimize the possibility of excitement, discomfort, and accidental injury of poultry. 3. Periodically evaluate the system to see whether there is any excitement, discomfort, or injury as livestock move from being unloaded from trucks to the knock box. Evaluate periodically how poultry are being handled and slaughtered to ensure (a) that any excitement, discomfort, or accidental injury is being minimized; (b) that all poultry are slaughtered in a manner that results in thorough bleeding of the poultry carcass; and (c) that breathing has stopped before scalding. 4. Improve or adjust operations in livestock to minimize

the excitement, discomfort, or possibility of accidental injury. A livestock establishment in Step 3, for example, might use video monitoring of the holding pens to determine whether employees are in fact minimizing excitement, discomfort, and accidental injury of animals. Similarly poultry establishments may use video or other electronic monitoring or recording equipment to monitor live areas to determine whether employees are taking actions to minimize excitement, discomfort, and accidental injury, as they position the birds for stunning and slaughter. Thus, the use of video or other electronic monitoring or recording equipment to support an overall systematic approach can provide assurance that the establishment intends to meet the requirements for humane handling and good commercial practices. Although FSIS encourages establishments to use appropriate video or other electronic monitoring or recording equipment, video surveillance from a remote location would not provide an effective method for FSIS to assess the consciousness of animals, as the Agency is required to do.

Assessing consciousness of animals involves direct observation from several visual perspectives and sometimes touching the animal's eyes or other parts. The use of video technology does not replace FSIS on-site verification activities of humane handling and good commercial practices. IPP need to conduct hands-on verification activities to assess whether an establishment's handling and slaughter", "7 activities comply with 9 CFR Part 313, 21 USC 603(b), and section 1902 of the HMSA (7 USC 1902). Similarly for poultry, IPP need to assess by hands-on verification whether birds are handled and slaughtered in a manner consistent with good commercial practices ( 9 CFR Part 381.65 (b)), and whether they are dying other than by slaughter (9 CFR Part 381. 90) (PPIA) 21 US 453(g) (5)). FSIS IPP are trained in humane handling and understand that they are obligated to take immediate action when they directly observe an egregious humane slaughter violation. If IPP were to observe an egregious event on an establishment's live feed video for example, IPP are expected to go directly to the place at the establishment where the event was occurring and ensure that the event has ended and does not persist. They are also expected to document appropriately the observation, even when the event witnessed is no longer occurring and to take any appropriate actions according to instructions in relevant FSIS Notices and Directives. NOTE: IPP are not to focus on the live feed video since it does not have a recording component and therefore cannot create a record. While the live feed may, on a rare occasion, point to a problem, it is a much more efficient use of IPP's time to perform the assigned tasks than to specifically focus on the live feed video, on the off chance that an egregious situation will be shown. For similar reasons, FSIS believes that IPP need to conduct hands-on verification activities for ante-mortem inspection (9 CFR Part 309 and Part 381.70 - 75). V. Use of Video or Other Electronic Monitoring or Recordings for Food Defense Purposes FSIS has prepared guidance documents for food processors to use to assist federally and State-inspected establishments that produce meat, poultry, and processed egg products in identifying ways to strengthen their biosecurity protection. FSIS recognizes that inspected plants may also be aware of, and may be adopting, guidelines from other government and private sector organizations and agencies. FSIS designed "Food Defense Guidelines for Slaughter and Processing Establishments" to meet the particular needs of meat and poultry establishments and processed egg products plants. These guidelines are available on the FSIS Web site at [http://www.fsis.usda.gov/Food\\_Defense\\_&\\_Emergency\\_Response/FSIS\\_Security\\_Guidelines\\_for\\_Food\\_Processors](http://www.fsis.usda.gov/Food_Defense_&_Emergency_Response/FSIS_Security_Guidelines_for_Food_Processors). While the guidelines are voluntary, and establishments may

choose to adopt measures suggested by many different sources, it is vital that all food businesses take steps to ensure the security of their operations. Video surveillance equipment can be used to meet many different and varied food defense concerns. Establishments may not cover every element of their Food Defense Plan with video cameras and may choose short, moderate, or long recording durations. A common use of video surveillance is", "8 monitoring the exterior of the buildings and premises to enhance the perimeter security of the establishment. Videos or other electronic monitoring or recordings used by establishments for food defense purposes to maintain active monitoring and surveillance of process points of highest concern (vulnerable nodes) in food systems represent a credible countermeasure against intentional contamination. Providing FSIS access to the videos regarding food defense activities is voluntary, unless the video includes information relevant to an official investigation, such as a suspected case of food tampering. In those situations, FSIS may request access to all applicable establishment records. If in the future, the Agency decides to propose mandatory development and implementation of functional food defense plans, access to video records is one of the issues that FSIS will consider in the rulemaking.

**VI. Use of Video or Other Electronic Monitoring or Recording Equipment to Meet HACCP and Sanitation SOP Recordkeeping Regulatory Requirements or for Other Purposes.**

Establishments are required to keep records related to their HACCP plan, including all decision-making with its operation (i.e., monitoring, verification, and corrective action). This documentation includes the results of any testing and of any monitoring or verification activities, such as in prerequisite programs that are performed by the establishment that may have an impact on the establishment\u2019s hazard analysis, whether or not such testing or monitoring is incorporated into an actual HACCP plan, referenced in a HACCP plan, or considered as separate activities. Records of these activities, that may have an impact on the establishment\u2019s hazard analysis, as well as designated HACCP records, are subject to FSIS review and are to be available to FSIS personnel (9 CFR 417.5 (e) and (f)). Establishments are required to develop and maintain a recordkeeping system that documents the monitoring of the critical control points (CCPs) (9 CFR 417.2(c) (6)).

Establishments need to decide in advance how they will document their monitoring of and verification activities for their CCPs. If an establishment determines and designates a video or other electronic monitoring or recording equipment to record the required HACCP information, this information is to be included as part of its recordkeeping system description. Accessibility of electronic or digital records is the same as for any other record, and establishments will need to comply with the applicable regulatory requirements for record retention and availability (9 CFR 320, 416.16, and 417.5). Establishments would need to provide appropriate methods or means for FSIS to view the video or digital records used for the purposes listed in 9 CFR Part 320. The regulations (9 CFR 417.4(a) (2)) require ongoing verification activities, including the review of records generated and maintained in accordance with 417.5(a) (3). FSIS", "9 would not anticipate that establishments can use video recordings to accomplish the purposes of 9 CFR 417.4(a) (2) (i) or (iii). However, an establishment may use video or other electronic monitoring or recording equipment as an ongoing verification activity by direct observation of the monitoring activities (9 CFR 417.4(a) (2) (ii)). If the establishment does so, it must have documents supporting the verification procedures and frequency of using the video for this purpose. This documentation would include support that the video or other electronic monitoring or recording equipment captures all of the observable activities at the CCP. For

example, if a recording, observed at a remote location, is used instead of physically walking to the monitoring point and observing the person, as they perform the monitoring procedures, then the establishment would have to demonstrate that the information and data recorded are accurate and that no food safety issues are missed. Recordkeeping requirements in 9 CFR 417.5(a) (3) include monitoring and verification procedures and their results, as well as the initials or signature of the individual making the entry, the time and date of entry, and the product identification (e.g. name, code, lot). For example, initials or signature of an individual might be achieved by a time stamp on the video corresponding to a specific company employee with specific access to that record. Establishments will also need to conduct activities designed to determine whether their automated recordkeeping systems are functioning as intended and to conduct verification activities on these systems. For video or other electronic monitoring or recording equipment, this means that the establishment will need to consider factors discussed in Section A \u201cSystems Used for Creating Video or Other Electronic Monitoring or Recording Records.\u201d The Sanitation SOP regulations (9 CFR 416.16 (a) (b)) require maintaining daily records to document the implementation and monitoring of the Sanitation SOPs and any corrective actions taken. Records required by this part may be maintained on computers provided the establishment implements appropriate controls to ensure the integrity of the electronic data. Establishments need to decide in advance how they are going to document Sanitation SOP implementation and monitoring activities, such as observing performance of sanitation tasks and identifying noncompliance. Establishments that designate and choose to use video records to meet Sanitation SOP regulatory requirements need to ensure that the video or other electronic monitoring or recording equipment they use meets the regulatory requirements of 9 CFR 416.16, that is, showing that the video records document the monitoring of the Sanitation SOP and any corrective actions that were taken. The establishment would need to determine how noncompliance would be identified, and what corrective actions it would need to take to restore sanitary operating conditions. If a video record is to be generated in addition to a paper monitoring or verification record, establishments should determine in advance and designate whether they plan to rely on the video recording or other electronic monitoring or recording or the paper", "10 record to meet regulatory requirements. Once the establishment designates the records from this type of equipment then the records would be available to the establishment and to FSIS, as are other records, according to 9 CFR 320, 416, and 417, for verification purposes. Establishments may choose to submit non-HACCP, non-Sanitation SOP, or other management or surveillance video records to appeal a decision in a Noncompliance Record (NR). The validity of those records would be determined on a case-by-case basis. For example, an electronic surveillance record may demonstrate that monitoring of the CCP took place, but the results of the monitoring were not recorded. Establishments should be aware that all information on video or other electronic equipment records used in an appeal may be considered by FSIS in making a final appeal decision.

A. Systems Used for Creating Video or Other Electronic Monitoring or Recording Records

When video or other electronic monitoring or recording equipment is used to produce records that meet regulatory requirements, an establishment needs to design, maintain, and validate its system so that the records generated will be trustworthy, accurate, and a true representation of the process. In the absence of controls, electronic records can be easily manipulated. For example, FSIS would consider the absence of a record showing who has

accessed a computer system, and what operations he or she has performed during a given period of time (audit trail) to be highly significant if there are data or record entry discrepancies. Similarly, lack of operational system checks to ensure that the correct order of manufacturing steps occurs (event sequencing) would be significant if such a deviation results in an adulterated or misbranded product. FSIS recommends that establishments consider the following factors and design elements when establishing this type of recordkeeping system:

1. A recordkeeping system involving video or other electronic monitoring or recording equipment should be compatible with commercial industry standards and allow migration to new technologies and standards. For example, data generated on an older software system should be moveable to a newer version software file format, which enables the user to easily view a clear and complete copy that is legible or what is called \u201chuman readable\u201d during the required record retention period for the applicable record. (See Section B \u201cMaintenance and Retention of Records Generated Using Video or Other Electronic Monitoring or Recording Equipment.\u201d)
2. A recordkeeping system involving video or other electronic monitoring or recording equipment that is designated as a record to meet HACCP or Sanitation SOPs should be based on consideration of the following elements:
  - Access: Access to record systems should be limited to authorized individuals.
  - "11 Accurate copy: Systems should be able to generate accurate and complete copies of records in human readable and electronic form suitable for inspection and review.
  - Audit trail: Systems should use secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes should not obscure, previously recorded information. Audit trail information should be retained throughout the record retention period and be available for review and copying. The system needs to be designed so that sufficient information is retained to facilitate audits and resolve disputes.
  - Authority checks: Systems should have a protocol or mechanism in place to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system, alter a record, or perform a required operation; and, there should be a means to ensure that the protocol or mechanism is rigorously followed in order to preserve original information and signatures reliably.
  - Education: Persons who develop, maintain, or use electronic record and signature systems should have the education, training, and experience to perform their assigned tasks.
  - Operator entry checks: Systems should include some mechanism that determines and records the validity of the source of any data entered manually. Appropriate controls over systems documentation should be established.
  - Policies: Establishments should establish and adhere to written policies that hold individuals accountable and responsible for actions initiated under their electronic signatures.
  - Establishments need to set standards for how data is entered and recorded by automated systems.
  - Protection: Systems should contain an adequate means to protect records for accurate and ready retrieval throughout the record retention period, including maintaining appropriate backup records.
  - System checks: Systems should allow use of operational checks to enforce permitted sequencing of steps and events.
  - Systems documentation: Systems should have adequate controls over the distribution of, access to, and use of documentation for system operation and maintenance. Revision and change control procedures should be in place to maintain an audit trail that documents the development and modification of systems documentation.
  - "12 Validation: Systems should be validated to ensure that they are accurate,

reliable, consistent, and able to discern invalid or altered records. Note: If an establishment contracts with a vendor to provide video or other electronic services, the vendor would need to meet or exceed the defined requirements of the components described above. Establishments should validate their electronic\computerized systems. 9 CFR 417.4(a) (1) states, \u201cValidation also encompasses reviews of the records themselves, routinely generated by the HACCP system, in the context of other validation activities.\u201d Consequently, establishments should consider the impact that the system itself might have on the accuracy, reliability, integrity, availability, and authenticity of all required records. FSIS recommends that an establishment base its approach upon a risk assessment and a determination of the potential of the system itself to affect product safety and record integrity. Some establishments may have an existing system in place. If that system does not meet the criteria noted above, then that system would likely need to be upgraded to address adequately the system components noted above.

B. Maintenance and Retention of Records Generated Using Video or Other Electronic Monitoring or Recording Equipment

FSIS believes that it is important to understand the factors unique to the maintenance of electronic records that need to be controlled to use the record. When needed, establishments should be able to accurately and readily retrieve and use the recorded information. Accessibility of electronic or digital information should follow established industry guidance, and establishments will need to comply with all applicable regulatory requirements for record retention and availability (9 CFR 320, 416.16 and 417.5). FSIS regulations in 9 CFR 320 contain basic requirements for records, including record retention time and types of records such as bills of lading, production records, invoices, shipping and receiving records, and related business records. The following principles and practices provide guidance for the industry to meet this objective:

1. Establishments should employ procedures and identify controls for the protection of records that permit their accurate and ready retrieval throughout the records retention period.
2. Establishments should update their documented procedures and controls as they make changes.
3. Establishments should identify and control factors that could affect the reliability of electronic records during their retention periods.

"13 Procedures should describe and include the following factors: How will the video surveillance or other electronic records be maintained? How is the data encoded within an electronic record (e.g., computer readable representations of information)? On what type of media (e.g., disk, tape, or flash memory devices) will the data be recorded? What hardware will be used to retrieve and display the electronic record? What software (both application programs and operating systems) will be used to read, process, and display electronic records? What are the storage conditions under which the records will be maintained? What environmental precautions are needed to maintain data (controlled environment)? What retrieval and access restrictions are there for data stored and maintained in electronic record storage (e.g., if personnel or software programs change or are upgraded can the stored data still be accessed)? Which personnel are responsible for maintaining the records? What processes are necessary to extract and present the information in human readable form? If these factors are not controlled properly, then the information that the electronic records convey might not be complete, accurate, or usable."]}, {"file\_name": "FSIS\_GD\_2013\_0017", "title": "Guidance on Ingredients and Sources of Radiation Used to Reduce Microorganisms on Carcasses, Ground Beef, and Beef Trimmings", "num": "FSIS-GD-2013-

The nutrition facts values for ground product an establishment manufactures may differ depending on the fat content of the trimmings or parts used as starting material.", "Additional Information Regarding Nutrition Facts Formats 1. How large must the Nutrition Facts label be? Answer: There are no specific size requirements for the nutrition label. However, the \u201cNutrition Facts\u201d heading must be in a type size larger than all other print size in the nutrition label and generally set the full width of the nutrition facts label (9 CFR 317.309(d) and 381.409(d)). Minimum type sizes of 6 point and 8 point are required for the other information in the nutrition label, and there are minimum spacing requirements between lines of text. 2. What are the minimum type sizes and other format requirements for the Nutrition Facts label? Answer: The illustration below indicates an example of the graphics FSIS uses to display the Nutrition Facts label. Format requirements are specified in 9 CFR 317.309(d) and 381.409(d). Overall Nutrition Facts label is boxed with all black or one color type printed on a white or neutral background Typeface and Size 1. The Nutrition Facts label uses 6 point or larger Helvetica Black and\or Helvetica Regular type. In order to fit some formats the typography may be kerned as much as -4 (tighter kerning reduces legibility). 2. Key nutrients & their % Daily Value are set in 8 point Helvetica Black (but \u201c%\u201d is set in Helvetica Regular). 3. Nutrition Facts is set in either Franklin Gothic Heavy or Helvetica Black to fit the width of the label flush left and flush right.", "4. Serving Size and Servings per container are set in 8 point Helvetica Regular with 1 point of leading. 5. The table labels (for example, \u201cAmount per Serving\u201d) are set in 6 point Helvetica Black. 6. Absolute measures of nutrient content (for example, \u201c1g\u201d) and nutrient subgroups are set in 8 point Helvetica Regular with 4 points of leading. 7. Vitamins and minerals are set in 8 point Helvetica Regular, with 4 points of leading, separated by 10 point bullets. 8. All type that appears under vitamins and minerals is set in 6 point Helvetica Regular with 1 point of leading. Rules 1. A 7 point rule separates large groupings as shown in the example. A 3 point rule separates calorie information from the nutrient information. 2. A hairline rule or 1\4 point rule separates individual nutrients, as shown in the example. The top half of the label (nutrient information) has 2 points of leading between the type and the rules, the bottom half of the label (footnotes) has 1 point of leading between the type and the rules. Box All labels are enclosed by \u00bd point box rule within 3 points of text measure. 3. Must all of the type specifications shown with the nutrition format example (above) be followed? Answer: No. The mandatory type specifications are listed in 9 CFR 317.309(d) and 381.409(d). Unlike the illustrative example of section (above): 1. Any legible type style may be used, not just Helvetica. 2. The heading Nutrition Facts must be the largest type size in the nutrition label (i.e., it must be larger than 8-point, but does not need to be 13-point). 3. There is no specific thickness required for the three bars that separate the central sections of the nutrition label. 4. Can I use type sizes larger than 8 point and 6 point? Answer:

The requirement for 6 and 8 point type sizes are minimum requirements. Larger type sizes may be used. 5. What can be done if the regular Nutrition Facts label (i.e., the vertical format) does not fit the package? Answer: On packages with more than 40 square inches available to bear labeling, the \u201cside-by-side\u201d format may be used if the regular Nutrition Facts label does not fit. In this format, the bottom part of the Nutrition Facts label (following the vitamin and mineral information) is placed immediately to the right and separated with a line. If additional vitamins and minerals are listed after iron and the space under iron is inadequate, they may also be listed to the right with a line that sets them apart from the footnotes.", "Also, if the package has insufficient continuous vertical space (i.e., about 3 inches) to accommodate the above format, the nutrition label may be presented in a tabular (i.e., horizontal) display.

Bilingual Format 6. On labels that have two languages, may nutrition information be provided in one bilingual Nutrition Facts label? Answer: When nutrition labeling must be presented in a second language, the nutrition information may be presented in separate nutrition labels for each language or in one label with the second language, translating all required information, following that in English. Numeric characters that are identical in both languages need not be repeated.", "Simplified Format 7. What are the special labeling provisions for one or more mandatory nutrients being declared as \u201c0?\u201d Answer: The footnote after

\u201c\*Percent Daily Values are based on a 2000 calorie diet\u201d can be deleted.", "Small Packages and Intermediate-Sized Packages 8. What are the special labeling provisions for small and intermediate-sized packages? Answer: Food packages with a surface area of 40 sq. in. or less available for labeling may place the Nutrition Facts label on any label panel (not limited to the information panel), may omit the footnote required in 9 CFR 317.309(d) and 381.409(d) if an asterisk is placed at the bottom of the label with the statement \u201cPercent Daily Values are based on a 2,000 calorie diet,\u201d and, may also use the tabular display label format. 9.

Are abbreviations permitted in Nutrition Facts labels for small and intermediate-sized packages? Answer: Food packages with a surface area of 40 sq. in. or less available for labeling may use the following abbreviations in the Nutrition Facts label: Label Term Abbreviation Label Term Abbreviation Serving size Serv size Cholesterol Cholest Servings per container Servings Total carbohydrate Total carb Calories from fat Fat cal Dietary fiber Fiber Calories from saturated fat Sat fat cal Soluble fiber Sol fiber Saturated fat Sat fat Insoluble fiber Insol fiber Monounsaturated fat Monounsat fat Sugar alcohol Sugar alc Polyunsaturated fat Polyunsat fat Other carbohydrate Other carb 9 CFR 317.309(g)(2) and

When will FSIS start scheduling webinars and meetings? A.FSIS plans to have a webinar within a month or two that discusses the general requirements of the nutrition labeling final rule and some Q&As. Once FSIS has prepared point-of-purchase materials and labels, FSIS also plans to schedule additional webinars and meetings. Q2. When FSIS provides the point-of-purchase materials, will they be different than the current posters and will they take into account the change in the values in the ARS database? A.The format will be similar to the existing posters. FSIS will continue to be in touch with ARS and the posters will include the new ARS values. Q3. Will the point-of-purchase materials be in high resolution quality on FSIS\u2019s website, so you can print larger posters? A.Yes, we plan to make the point-of-purchase materials in high resolution quality so that they can be enlarged, similar to the ones on the FDA website. Q4. Does the Agency intend to research the format of the point-of-purchase materials for better readability? The Industry is willing to work with FSIS on improving the format. A.FSIS is looking into and researching consumer readability. FSIS may conduct research on these issues in the future, provided

resources are available. Q5. Currently some posters include nutrition information for ground product. Will this nutrition information on posters disqualify businesses from using the small business exemption? A.No. Q6. Who has the burden of complying with the rule, e.g. the packer or the producer? A.Normally, the packer is considered the producer because the packer produces the final product. For ground or chopped product, the producer of the final packaged product is required to provide nutrition labels on the product, unless an exemption applies. The producer of the final packaged product may be a Federal establishment or retail facility. Retailers are required to provide point-of-purchase materials or nutrition labels for major cuts, unless an exemption applies.", "Q7. Will the inspectors be checking labels at the Federal establishments? A. As part of label verification activities, inspectors at establishments that produce ground or chopped products will periodically review labels to verify that establishments meet labeling February 9, 2011 requirements, including the requirement that the product bears a nutrition label, unless an exemption applies. Q8. If an establishment produces a mixed package of white meat and dark meat and both are major cuts, does the package need to carry 2 nutrition labels (one for white meat and one for dark meat)? A. The nutrition information for each of the major cuts could be provided at point-of purchase. Alternatively, the establishment could composite the nutrition facts panels or include two separate nutrition facts panels on the label for each product in the package. Q9. Is the leeway on values still 20%? A. Yes. The regulations in 9 CFR 317.309(h) and 381.409(h) specify that certain nutrient values are not out of compliance, unless they are more than 20% above the labeled value. That rule applies to the labeled values for calories, sugars, total fat, saturated fat, cholesterol, or sodium. These regulations also specify that certain nutrient values are not out of compliance, unless they are 20% below the labeled value. That rule applies to the labeled values for vitamins, minerals, protein, total carbohydrates, dietary fiber, other carbohydrates, polyunsaturated or monounsaturated fat or potassium. Q10. Will FSIS be doing educational sessions around the country like AMS did for country of origin labeling? A. This final rule is consistent with voluntary labeling regulations that have been in place since 1993. Therefore, FSIS thinks webinars and other meetings should be sufficient. Q11. If a producer is not sure of the lean and fat percentage of a ground or chopped product, could the producer label it with a worse lean and fat percentage? For example, could a producer label a product that is actually 80% lean and 20% fat, with a 70%lean\30% fat label? A. FSIS would not take action against producers estimating that their products are higher in fat than they actually are. Q12. Will State officers be doing any sampling for nutrient analysis? A. States that have their own meat and poultry inspection program are required to have programs at least equal to the Federal inspection program. Therefore, when FSIS begins conducting sampling for nutrient analysis of ground or chopped product, states with their own inspection program will have to conduct \u201cat least equal\u201d sampling and analysis.", "Q13. How will sampling work at retail? Will it be as complicated as with pathogens (microsampling)? How will establishments or retailers be notified? A. The details of the sampling program have not yet been worked out. However, product would not be considered adulterated if nutrition labeling information is inaccurate. Therefore, when February 9, 2011 FSIS begins sampling ground or chopped product at retail for nutrient content, FSIS does not anticipate providing establishments advance notice. Q14. Will the webinars include opportunities to ask questions? Will they be archived on the FSIS Website? A. We plan on having question and answer sessions in the webinars. Webinars are

typically posted on FSIS's website for 30 days. Q15. Will there be a label review process for retailers with unique needs? A. FSIS does not anticipate the need for this. LPDD does not pre-approve labels applied at retail unless they are shipped with the product from a Federal establishment. Retailers can submit questions concerning labeling through askFSIS. Q16. Will FSIS personnel be available to participate at industry conferences that are coming up in the next 90 days? A. Yes. Q17. How will retailers know the lean/fat content of ground products, and how will they determine the other nutrients in the nutrition facts panel? A. Retailers need to know that ground or chopped beef labeled as ground beef or hamburger does not contain more than 30% fat. Typically, they can get information concerning the lean and fat percentage from their suppliers or they can analyze the levels of fat at retail with an anal-ray or other device for measuring the fat content of ground beef. If the product does not contain AMR or low temperature rendered product, once the fat content is known, retailers can obtain information for the nutrition facts panel from the ground beef calculator available from the Agricultural Research Service at the Nutrient Database for Standard Reference, Release 23. This is available at: [www.ars.usda.gov/nutrientdata](http://www.ars.usda.gov/nutrientdata). Q18. Which cuts come under this rule? A. The final rule requires that nutrition information for the major cuts of single- ingredient, raw meat and poultry products be provided on the label or at point-of-purchase, unless an exemption applies. All ground or chopped products are also covered by the final rule (e.g., ground beef, ground pork, ground turkey). Nutrition", "information for all ground or chopped products must be provided on the label of the products, unless an exemption applies. The major cuts of single-ingredient, raw meat products covered by the rule are: Beef chuck blade roast, beef loin top loin steak, beef rib roast large end, beef round eye round steak, beef round top round steak, beef round trip roast, beef chuck arm pot roast, beef loin sirloin steak, beef round bottom round steak, beef brisket (whole, flat half, or point half), beef rib steak small February 9, 2011 end, beef loin tenderloin steak, pork loin chop, pork loin country style ribs, pork loin top loin chop boneless, pork loin rib chop, pork spareribs, pork loin tenderloin, pork loin sirloin roast, pork shoulder blade steak, pork loin top roast boneless, lamb shank, lamb shoulder arm chop, lamb shoulder blade chop, lamb rib roast, lamb loin chop, lamb leg (whole, sirloin half, or shank half), veal shoulder arm steak, veal shoulder blade steak, veal rib roast, veal loin chop, and veal cutlets. The major cuts of single-ingredient, raw poultry products covered by the rule are: Whole chicken (without neck and giblets), chicken breast, chicken wing, chicken drumstick, chicken thigh, whole turkey (without necks and giblets; separate nutrient panels for white and dark meat permitted as an option), turkey breast, turkey wing, turkey drumstick, and turkey thigh. Q19. In light of the new nutritional labeling regulations for ground product, is something like "\u201c85%\u201d still allowed on labels for retail sale with no qualifiers? A. No, under the 1993 nutrition labeling regulations that established the mandatory and voluntary nutrition labeling programs, in order for the term "\u201c\_percent lean\u201d to be used on the label or in labeling of the product, the product must have met the criteria for "\u201clow fat\u201d (9 CFR 317.362(b)(6) and 381.462(b)(6)). Most ground beef and hamburger do not qualify as "\u201clow fat.\u201d Therefore, the regulations precluded the use of the term "\u201c\_percent lean\u201d on these products. On May 24, 1994 (59 FR 26916) FSIS proposed to amend its regulations to permit a statement of the lean percentage on the labeling of ground beef and hamburger if it were contiguous to a statement of the fat percentage. On August 5, 1994, FSIS published a notice of extension of the date that it would enforce

compliance with the nutrition labeling requirements for ground beef and hamburger (59 FR 39941). The Agency extended the compliance enforcement date for these products indefinitely, pending publication of a final rule on percentage labeling for lean and fat on ground beef and hamburger. Since then, the Labeling and Program Delivery Division has approved many different labels, including use of a ratio like \u201c85\u201d without any qualifiers or words like \u201clean\u201d or \u201cfat\u201d on the label, because FSIS did not have a regulation in effect on the nutrition labeling of ground beef. FSIS has now published the nutrition labeling final rule, which permits a statement of lean percentage on the label or in labeling of ground or chopped meat and poultry products that do not meet the regulatory criteria for \u201clow fat.\u201d provided that a "statement of fat percentage is also displayed on the label or in labeling. The required statement of fat percentage must be contiguous to, in lettering of the same color, size, and type as, and on the same color background as, the statement of lean percentage. A ratio like \u201c85\u201d without the words \u201cpercent lean\u201d and \u201cpercent fat\u201d or \u201c%lean\u201d and \u201c% fat\u201d is not a statement of the lean and fat percentage. Without a complete statement of the percent fat and percent lean, consumers may not understand the meaning of the ratio. After the effective date of the nutrition labeling final rule, \u201c85\u201d and other ratios that are not complete statements should no longer be used on chopped or ground products for retail sale to consumers. Once the nutrition labeling final rule becomes effective on January 1, 2012, the Labeling and Program Delivery Division will no longer approve labels with only a ratio like \u201c85\u201d for retail products without the words \u201cpercent lean\u201d and \u201cpercent fat\u201d or \u201c%lean\u201d and \u201c% fat\u201d also on the label. A statement of percent lean and percent fat (e.g., \u201c85% lean\u201d/\u201c15% fat\u201d) will be permitted on the label for ground products that do not meet the regulatory criteria for \u201clow fat.\u201d Q20. If a Federal establishment is producing ground beef for distribution to another Federal establishment for further processing or to hotels, restaurants, and similar institutions (HRI) where it will be consumed on the premises, and the ground beef will not be distributed for sale to consumers at retail, can the establishment continue to label non-retail ground beef product with ratios or codes such as, \u201c90\u201d/\u201c10,\u201d \u201c70\u201d/\u201c30\u201d and \u201c80\u201d/\u201cup\u201d which are commonly used as ratios or codes by industry and food service establishments? A. Yes, ground meat and poultry products that are not for sale to consumers may continue to be labeled with ratios or codes such as, \u201c80\u201d/\u201c20\u201d and \u201c70\u201d/\u201cup\u201d provided: (1) the labels bear no nutrient content claims and (2) a statement of limited use is displayed on the label (e.g., \u201cfor further processing,\u201d \u201cnot for retail sale\u201d). FSIS believes that ratios or codes of this type are commonly used and understood by industry and food service establishments for ground meat and poultry products. Ratios or codes are not full statements, so their use doesn\u2019t violate the nutrition labeling final rule if they are only used by businesses for further processing. However, FSIS does not believe that consumers may always understand the meaning of ratios of this type without a complete statement of the percent fat and percent lean. Therefore, once the final rule titled, \u201cNutrition Labeling of Single-Ingredient Products and Ground or Chopped Meat and Poultry Products\u201d becomes effective on January 1, 2012, the Labeling and Program Delivery Division (LPDD) will not approve labels for ground meat and poultry products for retail sale with a ratio or code (e.g.,

\u201c85%\u201d); such codes will no longer be acceptable on product for sale to consumers. Labels for retail sale to consumers with this type of information without the words \u201cpercent lean\u201d and \u201cpercent fat\u201d or \u201c%lean\u201d and \u201c%fat\u201d should not be used and will not be approved after December 31, 2011. Labeling for retail sale to consumers may instead include a statement of the percent fat and percent lean as provided for in the regulation (e.g., \u201c85%lean/\u201d 15%fat\u201d).", "Q21: Will a small retail business, like a butcher shop, be exempt from the rule? A. Probably, it is likely that a small retail business, like a butcher shop, will qualify for the small business exemption for ground or chopped products under \u00a77317.400(a)(1) and 381.500(a)(1). There is no small business exemption for the \u201cmajor cuts\u201d of singleingredient, raw meat and poultry products. Therefore, a small retail business will be required to provide nutrition information for the major cuts of single-ingredient, raw meat and poultry products on labels or on point-of-purchase materials (e.g., signs, posters, or pamphlets). Nutrition information for the major cuts of single-ingredient, raw meat and poultry products are currently available at or [www.fmi.org/consumer/nutrifacts/](http://www.fmi.org/consumer/nutrifacts/) or [www.ars.usda.gov/nutrientdata](http://www.ars.usda.gov/nutrientdata). FSIS is also going to make point-of-purchase materials for the major cuts of single-ingredient, raw meat and poultry products available on the FSIS website. Q22: Will farmers that slaughter beef at small plants be exempt from this rule for products sold at farmers\u2019 markets? A. No, for major cuts, probably for ground beef products. If they sell major cuts of singleingredient, raw meat and poultry products at farmers\u2019 markets, they will be required to provide nutrition information for these products on labels or on point-of-purchase materials (e.g., signs, posters, or pamphlets). There is no small business exemption for the major cuts of single-ingredient, raw meat and poultry products. It is likely that a farmer that slaughters beef at a small plant will qualify for the small business exemption under \u00a77317.400(a)(1) from the nutrition labeling requirements for ground or chopped products. However, the small business exemption applies to the facility that slaughters, fabricates, packages and labels the product. Q23: Is a branded beef program (e.g., Angus Beef) that sells whole carcasses directly to approximately 20 independent retailers exempt from the nutrition labeling final rule? Is a supplier that only sells whole carcasses, not case-ready cuts, required to provide its retail customers with nutrition information? A. Yes, if the producer does not package products, this rule does not affect it. Additionally, the supplier who sells whole carcasses is not required to provide nutrition information to retail customers based on this regulation. Q24: Does a plant under USDA inspection that sells directly to consumers have to test each product so that it can be labeled with nutrition information? A. No, there is no requirement that an establishment has to test each product. The plant can obtain nutrition information and materials for the major cuts of single-ingredient, raw meat and poultry products that can be used at point-of-purchase from The Food Marketing Institute at [www.fmi.org/consumer/nutrifacts/](http://www.fmi.org/consumer/nutrifacts/). FSIS will also be making point-of-purchase (POP) materials available on its website. The National Cattlemen\u2019s Beef Association also has a website available at [www.beefretail.org/nutritionlabeler/](http://www.beefretail.org/nutritionlabeler/) that can be used to develop labels as well as POP materials for retail.", "If a retailer knows the fat content of the ground or chopped product, they can obtain information for the nutrition facts panel from the ground beef calculator available from the Agricultural Research Service at the Nutrient Database for Standard Reference, Release 23. This is available at [www.ars.usda.gov/nutrientdata](http://www.ars.usda.gov/nutrientdata). For more information regarding testing the fat content of

ground product, please see the answer to question 28. Also, if the plant qualifies for the small business exemption (\u00a7317.400(a)(1) or \u00a7381.500(a)(1)), then it would be exempted from the nutrition labeling requirements for ground and chopped products. Q25: Will meat that is sliced and weighed at the deli have to bear nutrition labels under the nutrition labeling final rule? A. No, the most recent nutrition labeling rule applies to \u201cmajor cuts\u201d and ground or chopped products, which are not typically deli products. Under current nutrition labeling regulations, product produced or packaged at retail (and not ground or chopped) is exempt from the nutrition labeling requirements (\u00a7317.400(a)(7) and \u00a7381.500(a)(7)). Q26: Will a full service meat counter, where none of the meat is packaged until a customer selects the product and then it is weighed and wrapped for the customer, have to comply with the nutrition labeling final rule? A. Yes, if the full service meat counter sells the major cuts of single-ingredient, raw meat and poultry products listed in the nutrition labeling final rule, it will need to provide point-of-purchase materials for the \u201cmajor cuts\u201d it sells. Ground product, unless it is ground at a customer's request, will require on-package nutrition facts panels, unless the business qualifies for the small business exemption or other exemptions. Q27: What is the small business exemption? A: The small business exemption is in \u00a7\u00a7317.400 and 381.500. The small business exemption applies to any establishment (or retail facility) that has 500 or fewer employees. Any product they produce at less than 100,000 lbs per year is exempt from nutrition labeling as long as the product includes no nutrition information or claims. Ground \u201cProduct\u201d would be designated by different formulas/different nutrient profiles. For example, 10% fat ground beef is a different product and has a different nutrient profile than 20% fat ground beef. Therefore, each would be counted separately toward 100,000 lbs of product. Different forms of the same product are counted together toward the 100,000 lbs. For example, 10% fat ground beef sold to hotels, restaurants, and similar institutions (HRI), 10% fat ground beef sold in 1 lb chubs, 10% fat ground beef sold as 4-ounce patties, and 10% fat ground beef sold in bulk, would all be counted together, since they all have the same nutrient profile." "Q28: When meat is ground at small and very small establishments and retail exempt facilities, how is the fat content supposed to be measured? A. It is the establishment's or retailer's responsibility to truthfully label the products. The regulations under 9 CFR 317.8(a) and 319.15(a) require a product labeled as \u201cground beef\u201d to contain no more than 30 percent fat. Therefore, it is up to the establishment to support that the product is not misbranded. Q29: Will random documentation be required to \u201cverify\u201d the processors' claims of 80% lean/20% fat or 90% lean/10% fat, etc.? A. No, there is no regulatory requirement that defines how the establishment needs to support the label, and there is no requirement that it test each lot. If they have a consistent process, using the same source materials, then the establishment could develop and implement a written program to periodically verify compliance with the label standard by ensuring that suppliers consistently provide the source materials necessary to produce the labeled product. Although, the nutrition labeling regulations do not specify how an establishment determines the nutrient content of products, \u00a7317.309(h) specifies how FSIS will sample/analyze product for compliance. Q30: Does the nutrition labeling final rule require nutrition labeling of seafood? Is the nutrition labeling program an FDA or an FSIS program? A. No, the nutrition labeling final rule does not require nutrition labeling of seafood. Seafood is regulated by the FDA. The nutrition labeling final rule is

an FSIS final rule. Q31: Are nutrition facts on posters at point-of-purchase required to be in 8pt font or larger, and the details on the bottom of the poster be in 6pt font or larger? Is there a requirement that the heading cannot be larger in font than the rest of the font on the poster? A. No, those are the specifications for a nutrition facts panel or point-of-purchase materials (POP) when a nutrient content claim is made. For POP without claims, there are no format requirements (see \u00a7317.345(a)(3)). Q32: Should the nutrition information used on point-of-purchase materials be based on Release 23 of the USDA National Nutrient Database for Standard Reference? A. Yes, that is the most current information from the Agricultural Research Service. Q33: When utilizing the USDA National Nutrient Database for Standard Reference to search for nutrient values for single-ingredient products to include on nutritional labels, options are given for \u201cSeparable Lean Only\u201d or \u201cSeparable Lean and Fat\u201d for the products in the database. What is the correct descriptor and subsequent value to choose for the product for accurate and acceptable nutrient information? For example, should \u201cPork, fresh, loin, top loin (chops), boneless, separable lean and fat, raw\u201d or \u201cPork, fresh, loin, top loin (chops), boneless, separable lean only, raw\u201d be chosen?", "A. The correct descriptor is NOT separable lean only. \u00a7317.345(d) specifies that the nutrient data should be based on meat cuts with external cover of fat at trim levels reflecting current marketing practices. 1\u20448 inch trim best reflects current market practices at this time and information available in the nutrient database. Q34: What are the minimum nutritional elements that have to be shown on the label? A. The basic mandatory information - serving size, servings per container, calories, calories from fat, total fat, saturated fat, cholesterol, sodium, total carbohydrate, dietary fiber, sugars, protein, vitamin A, vitamin C, calcium, iron. The servings per container statement does not need to be provided for the \u201cmajor cuts,\u201d but is required for ground and chopped products (servings per container may be stated as \u201cvaried\u201d for random weight products like ground products). There are voluntary nutrients as well (\u00a7\u00a7317.309(c) and 381.409(c)). Q35: Is there a required format for the nutrition facts panel? For example, can nutrition information be presented in script? A. Yes, the nutrition facts panel format is regulated. See 9 CFR 317.309(c)-(f) and 381.409(c)-(f). Meat and poultry products would probably qualify to use the simplified format. Additionally, if the total square inches of labeling space (for the entire package) is less than 40 sq. in., then the tabular format may be used. Nutrition information cannot be presented in script because the regulations stipulate that letters in the nutrition facts panel should never touch (\u00a7\u00a7317.309(d)(1)(ii)(D) and 381.409(d)(1)(ii)(D)). Q36: Can a simplified nutrition facts panel be used for \u201cmajor cuts\u201d or ground or chopped products? A. Yes, a simplified nutrition panel is acceptable since single-ingredient meat and poultry products do not generally contain carbohydrates. Q37: Does nutrition information have to be presented on top of the package, or, can it be presented as a separate label on the bottom of each package? A. No, the nutrition facts panel may be on the principle display panel (the front), or on the information panel (the first usable panel to the right of the principle display panel), which oftentimes is the back panel or the bottom of the package \u2013 see 9 CFR 317.2(m). The panel may either be part of the overall printed label or applied as a separate sticker. The following labeling guide book may be helpful: A Guide to Federal Food Labeling Requirements for Meat and Poultry Products Q38: Are establishments that only produce meat intended for hotels, restaurants, and similar institutions (HRI) (e.g., in 5 or 10lb bags) exempt

from the nutrition labeling requirements for ground and chopped products?","A. Yes, if the ground and chopped products are only produced for HRI, then the products qualify for an exemption from the nutrition labeling final rule and nutrition information is not required on the products, as long as the labeling bears no nutrition information or nutrition claims (\u00a7\u00a7317.400(a)(3) and 381.500(a)(3)). Q39: Will packages of meatloaf meat (e.g. raw ground beef and raw ground pork combined) be required to be labeled under the rule? A. If the product includes ground pork and ground beef, it would be a multi-ingredient product. Therefore, under current regulations, it would have to bear nutrition labeling unless it is subject to an exemption. Q40: Regarding the meatloaf meat, if the ground pork and ground beef are in separate portions on the same tray, could the package have two nutrition labels, one for the ground beef and one for the ground pork? A: Yes, if the ground beef and ground pork were separate, there could be two nutrition facts panels. Q41: Is sausage processed at a retail store exempt under 9 CFR 317.400(a)(7)(ii) from nutrition labeling? A. Yes, as long as there are no nutrition information or nutrient content claims on the labeling. Q42: Does the total carbohydrate value have to be listed on point-of-purchase materials? A. Yes, total carbohydrate is a core nutrient and must be listed on labels or point-of-purchase materials. For meat or poultry, total carbohydrates will generally be declared as \u201c0\u201d. Q43: Are \u201cmajor cuts\u201d that are marinated required to have nutrition labeling? A. No, nutrition labeling is not required for the major cuts of meat or poultry products marinated at the store (\u00a7\u00a7317.400(a)(7)(ii) and 381.500(a)(7)(ii)). If the meat and poultry products come to the store already marinated, packaged and labeled for the consumer, they require nutrition information, unless the supplier qualifies for the small business exemption on that product. Q44: Is a cube steak considered a chopped product or is it a muscle cut since the meat isn't chopped into separate pieces? A. A cubed steak is not considered a chopped product. It is a muscle cut. Q45: Can the required nutrition facts panel be added with a sticker label or insert label as a permanent solution to being compliant? A. Yes, a nutrition facts panel can be added as a sticker or insert."Q46: Can a food grade coated nutritional panel label be inserted with the chicken before being shrink wrapped and a sticker label that carries weight, price, product name etc. applied to the product once it is wrapped? A. Yes, as long as all the information remains visible at the time of purchase. Q47: Should the definition of the \u201cmajor cuts\u201d in \u00a7\u00a7317.344 and 381.444 be interpreted to include boneless fillets, tenderloins, thigh meat etc. or does it strictly include bone-in product only? A. Yes, since nutrition information is based on the edible portion of the product, it doesn't matter if the product is boneless or bone-in, the same product would have to have the same nutrition information on the raw 4-ounces edible portion or cooked 3-ounce edible portion. Q48: To what extent do nutritional claims on point-of-purchase (POP) materials have to be supported with on-pack nutritional labeling? For example, if a retailer states \u201cmake lean beef part of your diet\u201d does all the beef in the case have to be labeled as \u201clean\u201d or do the POP materials or on-pack labels have to identify specifically which items are \u201clean?\u201d A. If you make a statement about \u201cLean Beef\u201d on your POP materials, the POP materials would need to indicate which cuts of beef meet the lean definition. However, if a nutrition claim is made on POP materials, all of the format and content requirements of \u00a7317.309 apply. If only nutrition information-and not a nutrition claim-is supplied on POP materials, the requirements of \u00a7317.309 apply, but (i) the listing of percent Daily Value for nutrients

(except vitamins and minerals in \u00a7317.309(c)(8)) and footnote required by \u00a7317.309(d)(9) may be omitted, and (ii) the POP materials are not subject to any of the format requirements. Q49: Can nutrition facts for single-ingredient products be presented as raw or cooked on labels or point-of-purchase materials? If cooked, what is the correct description to use from the USDA National Nutrient Database for Standard Reference (i.e. broiled, braised, or roasted)? A. Point-of-purchase (POP) materials for non-ground single-ingredient, raw products can be based on nutrition information for raw or cooked products. If retailers provide nutrition information for the product as cooked, a cooking method that does not add any nutrients to the product must be used and the method must be indicated on the POP materials. However, if a nutrition claim is made on the POP materials, all of the format and content requirements of \u00a7317.309 apply. If only nutrition information-and not a nutrition claim-is supplied on POP materials, the requirements of \u00a7317.309 apply, but (i) the listing of percent Daily Value for nutrients (except vitamins and minerals in \u00a7317.309(c)(8)) and footnote required by \u00a7317.309(d)(9) may be omitted, and (ii) the POP materials are not subject to any of the format requirements.", "Q50: Does a %lean\%fat statement need to be on ground products that don\u2019t qualify as \u201clean\u201d according to USDA, or is it just an option? A. No, the use of a %lean\%fat statement is voluntary. No claims are required. However, for ground products, a %lean\%fat statement can be listed even though the products do not meet the definition of \u201clow fat\u201d (3 grams of fat per reference amount). Q51: Does \u00a7317.400(a)(7)(ii) exempt store-made gourmet burger patties (e.g., raw ground beef combined with cheese and onions) from nutrition labeling? A. Yes, burgers made in the retail store with diced cheese and chopped onions do not meet the regulatory standards for \u201cChopped Beef,\u201d \u201cGround Beef,\u201d \u201cHamburger,\u201d or \u201cBeef Patties\u201d under \u00a7319.15 because the burgers are ground beef with added foods, not added seasonings, and as such, they are descriptively labeled products. Therefore, as long as the labeling does not include any nutrition information or claims, burgers made in the retail store with other food added (e.g., diced cheese and chopped onions) are exempt from nutrition labeling because they are multi-ingredient products processed at a retail store, not multi-ingredient ground or chopped meat products (\u00a7317.400(a)(7)(ii)). Q52: Is \"pumped pork\" considered a multi-ingredient product and thus exempt from nutrition labeling under the final rule? A. Yes, pumped pork is a multi-ingredient product and not covered by this final rule. However, it is covered by the 1993 nutrition labeling regulations. Q53: When the nutrition labeling final rule becomes effective, will the nutrition label that will be applied to the product be generically approved or will the establishment have to re-apply for a new sketch approval? A. The establishment will have to apply for a label approval to add the nutrition facts to its single-ingredient or other ground products. However, similar to what has been done in the past, once the establishment obtains one label approval with a 4-ounce serving size, it can generically approve others from that one approval. Q54: Is a \u201cservings per container\u201d statement required on single-ingredient, raw products that are not ground or chopped? A. No, a \u201cservings per container\u201d statement is not required on the major cuts of single-ingredient, raw meat and poultry products. A \u201cservings per container\u201d statement is required on the labels of ground or chopped products. Because ground or chopped products are often random weight products, the servings per container may be listed as \u201cvary.\u201d Q55: Based on the

final 2010 nutrition labeling rule, ground product labeled for consumers cannot be labeled with ratios or codes for fat and lean, such as \u201c90\u201d/\u201c10\u201d or \u201c80\u201d/\u201c10\u201d. Are there other situations where ratios or codes such as \u201c90\u201d/\u201c10\u201d or \u201c80\u201d/\u201c20\u201d would be permitted on meat and poultry products?" "A. Yes, if the product is NOT for consumers and will be used for ground product, you could use a ratio (e.g., \u201c72\u201d/\u201c28\u201d) as an indication of the lean to fat ratio on the labeling provided: (1) the labels bear no nutrient content claims and (2) a statement of limited use is displayed on the label (e.g., \u201cfor further processing,\u201d \u201cnot for retail sale\u201d). Ratios or codes will also be permitted on the shipping containers that hold fully labeled ground product with a %Lean/% Fat statement. The shipping container can show a ratio on the shipping container, e.g., \u201c80\u201d/\u201c20\u201d instead of the statement of lean and fat percentage\u201c80%Lean\u201d/\u201c20%Fat\u201d.

Q56: Are marinated or injected (\u201chenhanced\u201d) products covered by this new regulation? A. No. This rule establishes new nutrition labeling requirements for major cuts of raw, single-ingredient products and ground products with or without added seasonings. Labels of multi-ingredient injected products are required to include nutrition information based on the original nutrition labeling regulations published in 1993 (58 FR 632), unless they qualify for an exemption.

Q57. Can a retailer add nutrition labels to a single-ingredient product that is otherwise fully labeled at the Federal plant and includes the legend? A. No, a retailer cannot add nutrition labels to product that is fully labeled at the Federal plant. However, retailers can provide POP materials for those products. The net weight is the only mandatory labeling feature that retailers may apply to packages of meat labeled at a Federal establishment. The regulations (9 CFR 317.2(h) and 381.121) permit a retailer to apply the net weight directly to random weight consumer size packages). If a ground beef chub is fully labeled at the Federal establishment, then only the Federal establishment can apply the nutrition facts panel to the package of ground beef chub. In comparison, the retail store can apply nutrition labels to packages if, for example, the store purchases the ground beef in bulk and repackages it into consumer size packages or purchases the product in chubs, removes the product from its original packaging, and repackages it at retail. The retailer in these scenarios would be packaging and labeling the product as opposed to the Federal establishment.

Q58. Can the retailer add nutrition labels to ground product that is otherwise fully labeled at the Federal plant and includes the legend? A. No, on case ready product, the retailer cannot add nutrition labels, if it was fully labeled at the Federal plant. Even if the Federal plant is exempt from the nutrition labeling requirements, nutrition labels cannot be added by the retailer.

Q59. Do retailers need to submit labels to FSIS for label approval? A. No, retailers do not need to obtain label approval from FSIS for adding the nutrition facts panel to products packaged at retail. Only federally inspected meat or poultry plants obtain label approval through our office. Adding the nutrition facts panel is no different from all of", "the other labeling features that a retailer places on labeling of products packaged at retail, e.g., product name, handling statement, net weight, address, safe handling instructions, and the ingredients statement.

Q60. Are immediate containers of imported meat and poultry products required to bear nutritional labeling features as mandated by 9 CFR Parts 317 and 381? A. Yes. Nutritional labeling requirements apply to meat and poultry products imported into the United States in the same respect that they apply to domestically produced products. Exemptions from nutritional labeling requirements are outlined in 9 CFR 317.400 and 9 CFR 381.500.

Q61. Do

retailers and Federal plants need to test each lot of product for nutrient content? A. No, there is no requirement that an establishment or retailer has to test each product. If necessary, the plant can obtain nutrition information and materials for the major cuts of single-ingredient, raw meat and poultry products that can be used at point-of-purchase from the FSIS website at: [www.fsis.usda.gov\Regulations\\_&\\_Policies\Nutrition\\_Labeling\index.asp](http://www.fsis.usda.gov/Regulations_&_Policies/Nutrition_Labeling/index.asp) or from The Food Marketing Institute at: [www.fmi.org\consumer\nutrifacts\](http://www.fmi.org/consumer/nutrifacts/). The National Cattlemen's Beef Association also has a website available at: [www.beefretail.org\nutritionlabeler\](http://www.beefretail.org/nutritionlabeler/) that can be used to develop labels. The nutrient content of the ground or chopped beef products can be obtained from the ground beef calculator available from the Agricultural Research Service at the Nutrient Database for Standard Reference, Release 23. This is available at: [www.ars.usda.gov\nutrientdata](http://www.ars.usda.gov/nutrientdata). For more information regarding testing the fat content of ground product, see askFSIS Q&A titled 2010 Nutrition Labeling Final Rule - verifying nutrition information and 75 FR 82160-82161. Q62. Will specific documentation be required to support the processors\u2019 claims of 80% lean\%fat or 90% lean\%fat, etc. on imported products that are ground domestically? A. No, there is no regulatory requirement that defines how the establishment needs to support the label, and there is no requirement that it test each lot. If the establishment has a consistent process, using the same source materials, then the establishment could develop and implement a written program to periodically verify compliance with the label\u2019s nutrition labeling information, including claims, by ensuring that suppliers consistently provide the source materials necessary to produce the labeled product. Although the nutrition labeling regulations do not specify how an establishment determines the nutrient content of products, \u00a7317.309(h) and 381.409(h) specify how FSIS will sample\analyze product for compliance and require that the management of the establishment maintain records to support the validity of nutrient declarations contained on product labels. All ground products may be subject to random sampling by FSIS." ,Q63. Do religious exempt products fall under this regulation? A. No, it would not. Religious exempt product is not an inspected product. If a company or retailer wanted to label religious exempt product with the nutrition facts, it would be on a strictly voluntary basis. The minimal labeling requirements for religious exempt product for retail sale are the plant number, the signature line, and a statement under which religious exemption the bird falls under. No other labeling is required for religious exempt product, unless the bird is un-eviscerated, and then the labeling would have to state the religious authority under which the bird was slaughtered. (9 CFR 381.10-381.14, specifically 381.10(a)(5) & (6)) Q64. Do raw kosher, soaked and salted products fall under mandatory nutrition labeling? A. Yes, if they are major cuts, raw kosher meat and poultry products would be subject to mandatory nutrition labeling. These products are considered to fall within the definition of single-ingredient, raw products, and, thus, are subject to mandatory nutrition labeling (58 FR 639). Q65. When the nutrition panel with the mandated nutrients is on the package, is the %lean\%fat statement necessary on the package? A. No, claims such as %lean\%fat are always voluntary; claims do not need to be included on the label. Q66. If changes are made to the POP materials from the FSIS website, do I have to update my POP materials before displaying? A. No. If substantial changes are made to the USDA\ARS data for the major cuts of meat and poultry products, FSIS will update the POP materials on the FSIS website in a timely manner. If a new version of the POP materials is posted on the FSIS website, retailers should update their POP materials as quickly as feasible. However, when

substantial changes are made to the USDA\ARS data for the major cuts, as long as the retailer updates their POP materials within 2 years of the date of the new version of the FSIS POP materials, FSIS will consider the retailer to be in compliance. Additionally, other POP materials are acceptable if they are based on the USDA\ARS Nutrient Database for Standard Reference.

Q67. If a retailer wants to make nutrient content claims on the major cuts of single-ingredient, raw products, is posting the FSIS or other POP materials sufficient? A. No, if a retailer makes nutrient content claims on these products, the nutrition facts must be displayed in an acceptable regulated nutrition facts format (all of the format and content requirements of \u00a7317.309 apply). If nutrient content claims are not made, the requirements of \u00a7317.309 apply, but (i) the listing of percent Daily Value for nutrients (except vitamins and minerals in \u00a7317.309(c)(8)) and footnote required by \u00a7317.309(d)(9) may be omitted, and (ii) the POP materials are not subject to any of the format requirements.", "Q68. If a retailer adds seasonings to ground beef (e.g., salt and pepper), would the product be exempt from the nutrition labeling regulations that require nutrition labels on all ground product? A. No, nutrition labeling is still required on the product. The nutrition labeling regulations apply to both seasoned and unseasoned ground product. The ground beef product must still meet the regulatory standard for \u201cGround Beef\u201d in 9 CFR 319.15(a). Therefore, only the seasonings permitted in ground beef are acceptable (for example, dry spices and natural flavorings).

Q69. Are the other ground products permitted to be seasoned? A. Yes, FSIS has permitted all ground products (e.g., ground beef, pork, chicken, turkey, etc.) to include the same type of seasonings that are permitted by the ground beef standard in 9 CFR 319.15(a).

Q70. When does a seasoned single-ingredient grind cease to be a single-ingredient grind (i.e., not covered by this regulation)? For example, if seasonings are added to ground pork that turn it into Italian sausage, is that product now exempt from the nutrition labeling requirements or does it still require a nutritional panel on the package? A. It depends upon the added ingredients and the product. Because the ground beef standard permits seasonings (9 CFR 319.15(a)), the nutrition labeling rule was written to encompass seasoned ground beef products as well as single-ingredient ground beef. Under the rule, ground beef with added seasonings is subject to nutrition labeling requirements, unless an exemption applies. The rule does not establish new requirements for products that are ground but that fall under another standard of identity (such as sausage) or products such as beef patty mix that have always been considered multi-ingredient products. Those products are required to bear nutrition labeling based on the 1993 final nutrition labeling rule (58 FR 632).

Q71. If a retailer has ground beef that\u2019s 80% lean\20% fat, and they add salt and pepper to it, can they still advertise that the beef is 80% lean\20% fat? A. Yes, provided that the data in the nutrition facts panel supports this statement.

Q72. If a retailer has ground beef that\u2019s 80% lean\20% fat, and they add cheese or bacon to the product, can they still say that the ground beef is 80% lean\20% fat? A. No, this is a multi-ingredient product and does not meet the standard of identity for \u201cground beef.\u201d A percent lean\fat statement would not be permitted on the product unless it meets the regulatory definition of \u201clow in fat.\u201d (9 CFR 317.362(b)(6))", "Q73. If the label includes nutrition information based on the cooked product, are actual \u201ccooking instructions\u201d required on the label, or can the label just state \u201cas packaged,\u201d or \u201cbaised,\u201d or \u201cbaked\u201d? A. The nutrition data in the nutrition facts panel for ground product must be on \u201cas packaged\u201d (raw)

but a second column can be voluntarily added to the nutrition facts panel for the product \u201cas consumed\u201d (cooked). The nutrition data in the nutrition facts panel or POP materials for the major cuts of raw, single-ingredient meat and poultry products can be provided either \u201cas packaged\u201d or \u201cas consumed.\u201d Whenever the \u201cas consumed\u201d data is provided for raw product, the cooking method must be included with the serving size, e.g., 3 oz braised (84g) (317.312(b) and 381.412(b)). Also, and cooking instructions for that method need to be included (317.345(d) and 381.445(d)) on the packaging to instruct the consumer how to obtain a fully cooked product( i.e., to ensure the raw product gets to an appropriate internal temperature). Simply stating braised in the serving size without braising instructions on the label is not sufficient. If the serving size is for product \u201cas packaged\u201d (raw) only, then cooking instructions are not required by the nutrition labeling rule, but cooking instructions are recommended for general labeling purposes unrelated to the nutrition labeling rule. POP materials do not require specific cooking instructions when nutrition information is listed for cooked products; they only require the method of cooking. Q74. For the major cuts of raw, single-ingredient meat or poultry products, what does FSIS consider \u201cclaims\u201d on labels or POP that would require nutrition information on the package instead of nutrition information at the point-of-purchase? A. Any claim identified in 9 CFR 317.300-317.400 or 381.400-381.500, including implied claims, would require nutrition information on the product. Such claims include, \u201clean,\u201d \u201clow fat,\u201d \u201clower sodium,\u201d \u201chigh in protein,\u201d and \u201cgood source of iron\u201d (i.e., any mention of a nutrient or calories). Q75. The beef data on the FSIS POP materials is based on 3 oz, cooked, 1\8th inch trim, \u201call grades\" product. If a retailer has only \u201cChoice\u201d, 1\4 inch trim product in their service case, will the FSIS POP materials be acceptable for compliance with the 2010 Nutritional Labeling Regulation? A. Yes, the beef data for 3 ounces cooked, 1\8 inch trim \"all grades\" is acceptable for posting for any beef product, provided there are no nutrient content claims as stated in 317.345(e) and 381.445(e). The regulations permit this general information for POP materials because it is not on a specific package of product. When nutrient content claims are included or the nutrition facts panel is on the package the information must represent the product in the package when such data are contained in the representative data base.". Q76. For single-ingredient ground products that are packaged and sold at that retail store, can the nutritional panel be displayed in either vertical (portrait) or horizontal (landscape) formats? Are there any restrictions that would modify these requirements? A. The same criteria apply at the store as at a Federal plant. The tabular format (landscape) may be used on packages with less than 40 total square inches of labeling space (9 CFR 317.309(g) and 381.409(g)). The vertical formats, either full format or simplified format (portrait), may be used on any label (317.309(d) and (f) and 381.409(d) and (f)). Keep in mind that the criterion to use the simplified format is in 9 CFR 317.309(f) and 381.409(f). Q77. Can the nutrition facts panel or a nutrition claim be a separate hand applied label as opposed to being part of the primary label? A. Yes, the nutrition facts panel or a claim can be a separate sticker. Q78. Does the nutritional panel need to be on top of the package (or can it be on the underside, like Safe Handling Instructions)? A. The nutrition facts panel can be on the underside of the package, on the information panel, just like the Safe Handling Instructions. Q79. Can ground product simply include a %Fat statement and not a %Lean%\%Fat statement? A. Yes, that is acceptable based on 317.313(i) and 381.413(i), as

a factual statement of percentage of a nutrient."],{"file\_name":"FSIS\_GD\_2012\_0007","title":"Questions and Answers Related to the Electronic Label Submission and Approval System (LSAS)","num":"FSIS-GD-2012-0007","id":"a454efe9f131415885e8ab24d02db96d7618564c3a421b95a1719f4880063185","corpus":"fsis\_guidelines","source\_page\_url":"https://www.fsis.usda.gov/policy/fsis-guidelines","url":"https://www.fsis.usda.gov/sites/default/files/import/FAQs\_LSAS.pdf","type":"pdf","n\_pages":3,"word\_count":1322,"text\_by\_page":["**QUESTIONS AND ANSWERS RELATED TO THE ELECTRONIC LABEL SUBMISSION AND APPROVAL SYSTEM (LSAS)** Q1. What is the Label Submission and Approval System (LSAS)? A. LSAS is a secure web-based electronic label submission application. LSAS allows users who have obtained a Level 2 e-Authentication account an alternative way to submit label requests for evaluation to the Labeling and Program Delivery Division (LPDD) and the Agricultural Marketing Service (AMS) for Child Nutrition (CN) Label approval. Q2. If I use LSAS, do I still need to complete the FSIS Form 7234-1? A. No. The FSIS Form 7234-1 found on the FSIS website is strictly for paper submission. The information fields from the FSIS Form 7234-1 have all been incorporated into LSAS, which you will complete on-line. You will have the ability to attach additional documents to your application, such as your label image, supporting information, and other related documents necessary to support your label request. Q3. What if I don't want to use the Label Submission and Approval System (LSAS)? How can I send in my label application? A. If you choose not to submit your label request to LPDD using LSAS, you may continue to use the current paper submission process using the official FSIS Form 7234-1 located on the FSIS website. For paper submissions you will want to review the Questions and Answers Related to the Application for Approval of Labels, Marking or Device, FSIS Form 7234-1. Q4. After I complete all the fields required in LSAS, will I be able to make a copy of my application for my records? A. Yes. You will have the opportunity to generate a PDF of the completed 7234-1 and any supporting documentation you have attached. You can also save the file to any location for your records. Q5. How will I know if LPDD received my submission? A. Once you select 'submit application', LSAS displays a confirmation message that the application has been submitted and includes a Label Identification Number for tracking purposes. Q6. How can I check on the status of my application? A. Each submitter will have a dashboard that includes typical pools found on a submitter's dashboard are Announcements (from the LSAS Administrator), Application Messages, Drafts, and status information, including, Submitted Applications, Adjudicated Applications, Returns and Rescinded Applications, and Appeals. If your application is still in the Submitted Applications pool with a received date, it is not in the review stage yet. Once your application is in review, the status date will change to pending. Depending on the outcome of the review, your applications will move to other pools, i.e. Adjudicated Applications, Returns and Rescinded Applications, etc."], "Q7. Where can I find instructions or training for LSAS? A. LPDD has provided a user guide for industry, PowerPoint presentations, and other information on our FSIS website. Additionally, the Agency's Outreach and Training Office (OEET) will be assisting LPDD in preparing webinars and other public presentations for training relevant to LSAS. Q8. Who do I contact if I need assistance or have a technical issue concerning LSAS? The LSAS administrator will be your first contact. You may email the administrator at LSAS@fsis.usda.gov or call 301-504-0837(M-F, 8:00am to 4:00pm EST). We ask that you use these resources first, rather than calling the main LPDD lines,

so that we can track all issues and provide appropriate resolutions. Q9. Who do I contact if I need help with my e-Authentication account? A. For assistance with your Level 2 e-Authentication account or password issues, you may contact: Service Desk 1-800-457-3642, Option 1 or eAuthhelpdesk@ftc.usda.gov Q10. How will child nutrition label applications be processed in LSAS? A. AMS technical staff has access to LSAS. LSAS will direct all child nutrition label applications first to the AMS technical staff. Once AMS adjudicates the label application as approved, LSAS will re-direct to LPDD for further evaluation and adjudication. Q11. I have a child nutrition label application that I want to submit by using the paper submission process. Does the process for submitting child nutrition label paper applications change at this time? A. No. AMS will continue to evaluate paper submissions as they have done in the past. For paper submissions you will want to review the Questions and Answers Related to the Application for Approval of Labels, Marking or Device, FSIS Form 7234-1. Once AMS adjudicates the paper submission as approved, it will be routed to LPDD in the usual manner. Once received by LPDD, it will be integrated into LSAS for further evaluation by LPDD technical staff. The adjudicated label will be printed and mailed back to the submitter. Q12. I heard LSAS has a tool to help determine whether the label can be approved using the generic labeling regulations. Why would a submitter want to use this? A. That is correct. LSAS includes a feature called the Generic Label Advisor (GLA) to determine whether a label can be generically approved. LSAS has incorporated the generic labeling regulations (9 CFR 317.5 and 381.133) into the GLA, which allows the submitter to respond to a series of questions. Based on the responses given by the submitter, the GLA will determine whether the label can be generically approved. Based on the responses, if the label can be generically approved, LSAS will generate a certificate that can be included in the submitter's labeling records.", "Q13. Can an appeal be submitted using LSAS? If so, what is the process? A. Yes. LSAS allows the submitter to appeal a LPDD decision, modifications, or denials. For instance, the submitter can select from their pool an adjudicated label with the status of sketch modified, and create the appeal by following the prompts provided. To use this option, the submitter should include the reason for requesting the label appeal and should include documentation to support the appeal. Note: All uncontested modifications to labeling must be made prior to the submission of an appeal. Q14. Does LSAS require me to install or download any special software or tools? A. No. The LSAS web application does not require you to install or download any tools in order to use it. All you need is a working Internet connection, Level 2 e-Authentication, and Adobe Reader. Q15. I started working on my label application but did not finish it. Will I have to abandon it and start over? A. No. LSAS will keep a draft of your label application in the Draft Pool. You may select the draft at a later date and continue to edit where you left off. Drafts will only be maintained for a period of 30 days from the date you last saved it. Q16. When I need to request a duplicate copy of a prior approval, I need to send in a letter requesting this information. Will I be able to retrieve prior approvals in LSAS now? A. Prior approvals (before LSAS implementation) are considered legacy data in LSAS and will not be available for viewing by the submitter. Therefore, for approvals prior to LSAS, you will need to continue to send in a letter requesting this information. Only new label submissions submitted electronically through LSAS will be available for viewing by the submitter. For duplicate copies of prior approvals (before LSAS implementation) see How to Request Duplicate Copies of Approved Labels . Q17. We have an in-house software system that incorporates the FSIS Form 7234-1. If we complete the label

## Additional

Reference \u2026\u2026\u2026\u2026\u2026\u2026\u2026.\u2026.page 4", "\u201cAt Least Equal to\u201d Compliance Guideline for State Meat and Poultry Inspection (MPI) Programs for Residue Testing December 2012 I. Purpose This guidance addresses in-plant screening of residues in meat and poultry products. The Food Safety and Inspection Service (FSIS) is now using the Kidney Inhibition Swab (KISTM) as its in-plant drug residue screening test. Effective August 19, 2012, the Agency discontinued the use of the Fast Antimicrobial Screen Test (FAST) to detect antimicrobial drug residues in all livestock in federally inspected slaughter establishments. For this reason, to meet \u201cat least equal to\u201d standards, State MPI programs are required to discontinue their use of the FAST and switch to the KISTM test. II. Background In 1994, FSIS started using the FAST in-plant residue screening test to detect antimicrobial residues in animal tissues. An FSIS review of the FAST sampling data results from federally inspected establishments suggested that in-plant screening procedures could be enhanced to provide additional public health protection. To accomplish this initiative, FSIS decided to upgrade the manner in which residues are tested through the use of the KIS\u2122 test. The KIS\u2122 test is a simple-to-use antibiotic detection test for use on kidney tissue. The test can be performed on fresh or thawed kidneys and can be performed by inspection program personnel (IPP), who can also read the results in as little as 3

hours, with the test results remaining stable up to 16 hours. The KIS\u2122 test shows better detection capabilities than FAST for certain drugs, and it can screen for additional compounds, such as Tilmicosin, Tulathromycin, and Bacitracin. Also, the KISTM test can detect residues of certain drugs \u2013 including Penicillin G, Neomycin, and Sulfonamides -- at levels closer to their U.S. tolerances than the FAST. In addition to its greater detection capability, the KISTM test is easier to use in the plant and produces more consistent results, compared to those yielded by the FAST. The KIS\u2122 Test Instructions booklet contains information on the testing supplies needed and instructions on how to perform the test. The booklet is available on the FSIS website using the following link:

[http://www.fsis.usda.gov/PDF/KIS\\_Booklet\\_0710.pdf](http://www.fsis.usda.gov/PDF/KIS_Booklet_0710.pdf). III. In-Plant Testing Using the KIS\u2122 Test To be \u201cat least equal to\u201d the Federal inspection program, State MPI programs must conduct inspectorgenerated in-plant residue screening tests in accordance with current FSIS policies that provide instruction on the type and use of current testing methods. On June 26, 2012, the Agency informed IPP that it was extending the process for replacing FAST with the KISTM test in all federally inspected livestock slaughter establishments to August 19, 2012. MPI programs will stop using FAST by January 31, 2013. After December 31, 2012, FSIS will no longer produce the FAST plates nor provide FAST supplies for MPI programs. In addition, after this date, FSIS will not accept FAST plates that are prepared from outside sources. State MPI programs that historically run an average of more than one FAST per week need to obtain training materials on performing the KISTM test and purchase KIS\u2122 test supplies and equipment for each slaughter establishment. For these establishments, State MPI personnel will conduct the KIS\u2122 test and send the KIS\u2122 test positive samples to the FSIS Midwestern Laboratory (MWL) for confirmation.", "\u201cAt Least Equal to\u201d Compliance Guideline for State Meat and Poultry Inspection (MPI) Programs for Residue Testing December 2012 3 State-inspected slaughter establishments that historically run an average of less than one FAST per week will need to submit samples of kidney, liver and muscle from animals suspected of having violative residues directly to the MWL at no cost to the State rather than to a central in-State laboratory. The State MPI program will contact MWL first when it has a sample to be forwarded for residue testing. The MWL, in turn, will send three to five boxes (with FedEx air bills) as the State identifies its sample submission needs. The MWL will return the shipping containers that contained the packaged samples to the State along with fresh supplies for future sample shipments. It is acceptable for slaughter establishments that historically run an average of less than one FAST per week to purchase a Digital Dry Block Heater that holds up to four tests, instead of 20. IV. Ordering KIS\u2122 Test Supplies for State MPI Programs To perform the KISTM test , State MPI programs will need the following supplies: 1. Digital Dry Block Heater (tests up to 20 units); 2. KISTM (Kidney Inhibition Swab) Tests; 3. Negative Controls; 4. 15 ml Tube of Deionized or Distilled Water (or equivalent); 5. Timer; 6. Transfer Pipettes or equivalent device for delivering 1ml of water; and 7. Test Tube Rack (or equivalent device) to hold KISTM tests. State MPI programs can order the following KISTM test supplies directly from the vendor, Charm Sciences, Inc. (telephone number 1-800-343-2170): \u2022 Digital Dry Block Heater (holds up to 20 tests)(Order Code INC-20-110); \u2022 KISTM (Kidney Inhibition Swab) Tests (units of 25) (order code KIS-100);and \u2022 Negative Controls (units of 4) (Order Code NCKIS-4). The ancillary testing supplies listed above (items 4 \u2013 7) can be purchased by State MPI programs through a general laboratory supply

vendor.", "At Least Equal to Compliance Guideline for State Meat and Poultry Inspection (MPI) Programs for Residue Testing December 2012 4 V. Training FSIS will make training materials with instructions on performing the KISTM test available to State MPI programs. Instructional materials, entitled Performing the KISTM Test, are available in both CD-ROM and written formats. The KISTM Test Instructions booklet is also available in hard copy, upon request. Requests for KISTM Test training materials should be sent to CEDL@fsis.usda.gov . States are to include the contact person, phone number and return address for shipment of training materials. VI. Additional Information Questions regarding KIS testing can be submitted through askFSIS using the following link:  
<http://askfsis.custhelp.com/> When submitting a question, use the Submit a Question tab, and enter the following information in the fields provided: Subject Field: Enter KIS testing Question Field: Enter your question with as much detail as possible. Product Field: Select General Inspection Policy from the drop-down menu. Category Field: Select Sampling - General from the drop-down menu. Policy Arena: Select Domestic (U.S.) Only When all fields are complete, press the Submit button. Additional information on KIS testing is available in the series of askFSIS Q&As and can be found on the askFSIS web page and by entering "KIS" in the search feature: VII. Reference FSIS At Least Equal To Compliance Guidelines for State Meat and Poultry Cooperative Inspection Programs (July 2008)"], {"file\_name": "FSIS\_GD\_2013\_0001", "title": "FSIS Compliance Guideline: Lebanon bologna", "num": "FSIS-GD-2013-0001", "id": "8ed6d48c41d569b810889c546f61d5e19cf3e7ae443cf84340096960305743e", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Compliance\_Guideline\_Lebanon\_Bologna.pdf", "type": "pdf", "n\_pages": 8, "word\_count": 3282, "text\_by\_page": [{"1": "FSIS Compliance Guideline: Lebanon bologna January 2013 Food Safety Lessons Learned from the Lebanon Bologna Outbreak What is the purpose of this Compliance Guideline? This Compliance Guideline contains information regarding lessons learned from a Food Safety Inspection Service (FSIS) investigation of a Lebanon bologna product associated with a foodborne illness outbreak of E. coli O157:H7 in 2011. During the outbreak investigation, FSIS identified that inadequate validation of the Hazard Analysis Critical Control Point (HACCP) system design may have led to the production of adulterated product. Using the findings from the investigation, this guideline articulates how industry can meet FSIS expectations regarding the production of Lebanon bologna. It is important to note that this guideline represents FSIS' current thinking on this topic and should be considered usable as of the issuance date. Who is this guidance designed for? All Lebanon bologna processors. How is this guidance being shared? This guidance document is available on the FSIS web site for establishments to use. In addition, FSIS inspection program personnel were instructed to hold an awareness meeting in May 2012 (per Notice 36-12) with establishments that produce Lebanon bologna to share the lessons learned from the Lebanon bologna outbreak (including those covered in this document), and how the establishment can comply with regulatory requirements in 9 CFR 417.4(a)(1), 9 CFR 417.5(a)(1), and 9 CFR 417.5(a)(2). Is this version of the guidance final? Yes, this version of the guidance document, dated January 2013, is considered final and replaces the previous version of the document. No comments were received during the comment period; however, a change was made to the recommendations related to relative humidity on page 6"}]}]

as a result of an askFSIS question received. Specifically, this version clarifies the circumstances under which relative humidity would not need to be monitored as part of the Hazard Analysis and Critical Control Point (HACCP) system. Guidelines will be continually updated to reflect the most current information available to FSIS and stakeholders, although comments will no longer be accepted through regulations.gov on this guidance document. In addition, this final version made changes to the recommended log reduction for Listeria monocytogenes to be consistent with other FSIS guidance documents." "2 FSIS Compliance Guideline: Lebanon bologna January 2013 Why was this guidance developed? In March 2011, there was a recall of a Lebanon bologna product that was associated with a foodborne illness outbreak of E. coli O157:H7. An FSIS investigation into the processing of the product revealed that the establishment had not properly validated their Lebanon bologna process. In particular, the establishment did not identify supporting documentation during the design of the HACCP system that closely matched the actual commercial process used. In the actual process at the establishment, raw Lebanon bologna mix was compacted in 52 to 119 mm diameter permeable casings that were placed in a large smokehouse fitted with a single source of heat and humidity that was not well-controlled. However, in the supporting documentation identified by the establishment to represent a commercial process for Lebanon bologna, raw Lebanon bologna mix was compacted in smaller 27 millimeter diameter impermeable sealed glass tubes that were immersed in a wellcontrolled water bath. The difference in the diameter and type of casing material likely led to a lower reduction in foodborne pathogens of concern in the actual process than what was demonstrated in the supporting documentation. If the diameter of the establishment's product is larger than that of the product used in the supporting documentation, it is possible that the product core will take longer to reach the desired temperature and pH. Taking a longer time than expected to reach the desired temperature and pH may lead to a lower level of pathogen reduction. Critical operational parameters such as the product diameter and type of casing material can also affect the amount of moisture exchange between the product and the environment and can play a role in the effectiveness of the fermentation. For these reasons, it is important that when an establishment designs its HACCP system during the initial validation period that it identify supporting documentation that is representative of the actual process so that the results can be repeatable. In the case of the establishment identified in the outbreak, additional supporting documentation should have been identified during initial validation demonstrating adequate reduction in pathogens would be achieved with a product of the same diameter and casing type as that used in the actual process. What are some measures establishments can take to manufacture Lebanon bologna safely? In order to manufacture Lebanon bologna safely, it is particularly important that establishments validate their processes. There are two distinct elements to validation: 1) the scientific or technical support for the HACCP system design (design) and 2) the initial practical in-plant demonstration proving the HACCP system can perform as expected (execution). The key steps to achieving these two elements are summarized on the next page:" "3 FSIS Compliance Guideline: Lebanon bologna January 2013 Element 1: Scientific or Technical Support (Design) 1. Identify supporting documentation (e.g., journal articles, challenge studies, or data gathered-in plant) that closely matches their process; 2. Identify supporting documentation that demonstrates the expected level of bacterial pathogen reduction (e.g., a 5-log<sub>10</sub> reduction of Salmonella spp. and E. coli O157:H7, and a 3-log<sub>10</sub> reduction of Listeria monocytogenes, although a 5-log<sub>10</sub> reduction or

greater is desirable for providing an even greater safety margin for ensuring that L<sub>m</sub> doesn't grow during cold storage to detectable levels); and 3. Identify the critical operational parameters from the supporting documentation relevant to their commercial process (i.e., fermentation temperature, relative humidity, come up time to low temperature heating step, hold time and temperature for low temperature heating step, equipment, pH and time to reach target pH, type and use of starter cultures, and product characteristics such as diameter, composition, and casing type). Element 2: Initial In-Plant Demonstration (Execution) 4. Implement those same critical operational parameters in their production process (e.g. as a Critical Control Point (CCP), prerequisite program, or as part of the HACCP system); 5. Identify at least one product from each HACCP category to gather in-plant validation data; and 6. Gather data demonstrating the effectiveness of the implementation of the critical operational parameters. Establishments should identify supporting documentation that closely matches their process and should identify all of the critical operational parameters from the supporting documentation relevant to their commercial production process. Critical operational parameters are the specific conditions that an intervention or process must operate under in order for it to be effective. Such critical operational parameters include pH, time, temperature, relative humidity, equipment settings or calibration, and spatial configuration. If the critical operational parameters used in an establishment's process do not closely match those in the supporting documentation, adequate lethality may not be achieved, and the establishment may not be able to support the decisions in its hazard analysis on an ongoing basis as required in 417.5(a)(1). NOTE: FSIS recommends that the supporting documentation address the worst case scenario because of variability in the actual process for the critical operational parameters identified. For example, the supporting documentation should be based on the highest expected pathogen load, shortest amount of time", "4 FSIS Compliance Guideline: Lebanon bologna January 2013 it takes the actual product to achieve the target temperature for the low temperature heat step, the longest amount of time it takes the actual product to reach the target pH, or the lowest relative humidity achieved. Such worst case scenarios can be determined by reviewing monitoring and pre-requisite records the establishment currently collects associated with the critical operational parameters identified in the supporting documentation. In some circumstances, establishments may be able to support using critical operational parameters that are different from those in the supporting documentation (e.g., higher concentrations of antimicrobials or higher thermal processing temperatures). In these cases, establishments should provide justification supporting that the levels chosen are at least as effective as those in the supporting documentation. This justification is needed because different levels of a critical operational parameter may not always be equally effective. For example, higher processing temperatures may result in the surface of the product drying out before adequate lethality is achieved. In addition to ensuring that the levels chosen are at least equally as effective, establishments should ensure the levels are also safe and suitable

(<http://www.fsis.usda.gov/OPPDE/rdad/FSISDirectives/7120.1.pdf>). Once all of the relevant critical operational parameters from the supporting documentation have been identified, establishments should implement and monitor those parameters in their system. During the initial set-up of their system, establishments may decide that one or more critical parameters from their scientific supporting documentation are either monitored as a CCP in

response to a hazard that the establishment has identified as reasonably likely to occur or that are verified on an ongoing basis as part of a pre-requisite program in response to a hazard that the establishment has identified as not reasonably likely to occur because of the execution of that pre-requisite program. Establishments are required to support the development of critical limits for CCPs, per 9 CFR 417.5(a)(2) used to control hazards identified as reasonably likely to occur and are required to support the development of pre-requisite programs used to prevent hazards identified as not reasonably likely to occur per 9 CFR 417.5(a)(1). Establishments may also, however, decide that a limited number of other critical operational parameters will only be verified during the initial validation period (for example, product diameter or casing type). Establishments are required to validate the design and execution of their HACCP system per 9 CFR 417.4(a)(1) which would include ensuring that critical operational parameters that are not incorporated into a critical limit of a CCP or into a pre-requisite program can be met (for example the equipment, product composition provided it does not change or spatial configuration of a system). These parameters should be included in a decision-making document but do not necessarily need to be monitored on an ongoing basis, provided they do not change over time. Further information on validation can be found in the Draft FSIS Compliance Guideline HACCP Systems Validation found at:

[http://www.fsis.usda.gov/PDF/HACCP\\_Systems\\_Validation\\_Draft\\_Guidance\\_0412.pdf](http://www.fsis.usda.gov/PDF/HACCP_Systems_Validation_Draft_Guidance_0412.pdf). "5 FSIS Compliance Guideline: Lebanon bologna January 2013 NOTE: For information that can be used to control Salmonella and E. coli O157:H7 in Lebanon bologna and other semi-dry fermented sausage products, establishments can refer to the FSIS Salmonella Compliance Guidelines for Small and Very Small Establishments that Produce Ready-to-Eat (RTE) Meat and Poultry Products (RTE Salmonella Guidelines), found at

[http://www.fsis.usda.gov/PDF/Salmonella\\_Comp\\_Guide\\_091912.pdf](http://www.fsis.usda.gov/PDF/Salmonella_Comp_Guide_091912.pdf). Finally, in addition to ensuring the critical operational parameters used in an establishment's process closely match those in the supporting documentation; establishments should also make efforts to ensure that sanitary conditions are maintained in their post-lethality processing environment. This will help ensure that RTE products are not contaminated after the lethality step. Steps should also be taken to ensure the safety of ingredients that are added to the product, to ensure that contaminated ingredients are not added after the lethality treatment. Further information on sanitation in RTE establishments and ensuring the safety of ingredients can be found in the RTE Salmonella Guidelines (referenced in the note above) and the Listeria Guidelines found at:

[http://www.fsis.usda.gov/PDF/Controlling\\_LM\\_RTE\\_guideline\\_0912.pdf](http://www.fsis.usda.gov/PDF/Controlling_LM_RTE_guideline_0912.pdf). What are the critical operational parameters for production of Lebanon bologna? Examples of critical operational parameters for the production of Lebanon Bologna include: Fermentation temperature Hold time and temperature for low temperature heating step Come up time to low temperature heating step Relative humidity Equipment Type and use of starter cultures pH and time to reach target pH Product characteristics (e.g., diameter, composition, and casing type) These parameters may also apply to other fermented, semi-dry processes. In addition to using the critical operational parameters identified in the supporting documentation, it is important for establishments to use source materials prepared under Good Manufacturing Practices (GMPs) designed to minimize contamination and the presence and growth of pathogens of public health concern. If pathogen

levels are high on source materials, the process may not be sufficient to achieve full lethality, and some pathogens could survive in the product." "6 FSIS Compliance Guideline: Lebanon bologna January 2013 Specific considerations for several critical operational parameters as related to Lebanon bologna processes are outlined below:

1. Fermentation temperature\heating come up time (CUT)\hold time and temperature for low temperature heat step \u2013 The temperature that the product is heated to, and the amount of time the product is held at this temperature, are critical to ensuring that adequate lethality is achieved. The establishment should have an understanding of factors that could affect the temperature of the product (e.g., cold spots or variation in temperature of the oven during different seasons). In addition to the hold time and temperature, the time it takes the product to reach the target temperature for the low temperature heat step (also known as the come up time or CUT) may be important. A number of factors, such as product diameter and relative humidity, affect heat transfer and the amount of time it takes the product to reach the target temperature. It is important for the establishment to understand how the actual temperature of the product, the CUT, and the amount of time the product is held at the target temperature compare to the supporting documentation. If the CUT in the establishment\u2019s process is shorter than the time it takes in the study, for example, then the establishment\u2019s process may result in a lower level of pathogen reduction.

2. Equipment \u2013 Differences in equipment (e.g., smokehouses and ovens) used in the processing of Lebanon bologna can influence the effectiveness of the process and, in particular, the speed of fermentation or acidification and heating. For this reason, the establishment should gain an understanding of the humidity profile as well as the pH and temperature profile of the product throughout the process. In addition, seasonality of atmospheric conditions, cold-spot determination, or heating consistency should be understood and used to inform monitoring and verification procedures and the frequencies at which those procedures are monitored and verified.

3. Relative humidity \u2013 Relative humidity is an important parameter in most dried meat processes. A relatively high humidity is preferred to keep the product surface moist during the fermentation and intermediate heating steps, prior to drying. Controlling humidity prevents premature and uneven drying at the surface and also shortens the time it takes for the product core to reach the desired temperature. For these reasons, it is important that the lower end of the relative humidity range in the establishment\u2019s process is at least as high as the lower end of the relative humidity range used in the supporting documentation and is applied at the appropriate process steps.

NOTE: Humidity is inherently maintained and, therefore, does not need to be monitored as part of the HACCP system for products that use an impermeable casing. This is because impermeable casings will prevent or inhibit moisture loss so that the heat resistance of pathogens is not affected by the cooking process (e.g., sausages cooked in casings). In the case of the Lebanon bologna outbreak, the product used a permeable casing which allowed moisture loss to occur during the cooking process. In that case, relative humidity was not wellcontrolled and should have been because of the nature of the product.

For more", "7 FSIS Compliance Guideline: Lebanon bologna January 2013 information on processes in which humidity is inherently maintained and does not have to be added or monitored as part of the HACCP system, see the Appendix A Guidance on Relative Humidity and Time\Temperature for Cooking\Heating and Applicability to Production of Other Ready-to-Eat meat and Poultry Products found at:

[http://www.fsis.usda.gov/OPPDE/rdad/FRPubs/95033F/Appendix\\_A\\_guidance\\_95-033F.pdf](http://www.fsis.usda.gov/OPPDE/rdad/FRPubs/95033F/Appendix_A_guidance_95-033F.pdf). 4. pH and time to reach target pH \u2013 Semi-dry sausage products like Lebanon bologna are usually fermented to a pH of between 4.4 - 4.6. The establishment should be fermenting its product to the pH that is recommended in the supporting documentation. In addition to the pH level itself, the time it takes the product to reach the desired pH is also important. If a product takes too long to reach the desired pH, the acid resistance and pathogenicity of *E. coli* O157:H7 and *Salmonella* may increase. In addition, these conditions may favor *Staphylococcus aureus* growth and enterotoxin production. Therefore, it is also important that the establishment monitor the time it takes the product to reach pH of 5.3. The American Meat Institute has determined that a process documented to reduce product pH to 5.3 within a defined number of hours at a defined temperatures (known as the degree-hours) is capable of controlling growth of *Staphylococcus aureus* (for more information on the degree-hour concept see the American Meat Institute\u2019s Good Manufacturing Practices for Fermented Dry and Semidry Sausage Products:

[http://www.meathaccp.wisc.edu/assets/Heat\\_Treated\\_Shelf\\_Stable/AMIF\\_degreehours.pdf](http://www.meathaccp.wisc.edu/assets/Heat_Treated_Shelf_Stable/AMIF_degreehours.pdf)). For these reasons, it is critically important that establishments monitor the pH of the product during fermentation as well as the time it takes the product to reach the desired pH, to ensure that the time it takes the product to reach the desired pH is consistent with the supporting documentation and is within an acceptable number of degree-hours. NOTE: According to the Food Standards and Labeling Policy Book, a Lebanon bologna product that has a Moisture Protein Ratio (MPR) of 3.1:1 or less and a pH of 5.0 or less does not require refrigeration. However, meeting these criteria does not necessarily mean that the product has received sufficient log reduction for pathogens of public health concern (e.g., *E. coli* O157:H7, *Salmonella* and *Listeria monocytogenes*). 5. Starter culture - The starter culture used in the product should be similar in composition to that used in the supporting documentation, to ensure that fermentation is achieved, and the rate of pH drop is as expected. The starter culture should be formulated to ensure microbial dominance of fermentation strains over any potential pathogens and to inhibit potential *Staphylococcus aureus* growth during fermentation. In addition, the starter culture used for fermentation can affect whether bacteriocins (toxins produced by bacteria that inhibit the growth of other similar bacteria) are produced and the type of bacteriocins produced, which can affect the level of reduction for bacterial pathogens.", "8 FSIS Compliance Guideline: Lebanon bologna January 2013 6. Product Characteristics \u2013 a. Casing diameter - Product casing size and shape are critical operational parameters in fermented, semi-dry processes because they affect heat transfer. For Lebanon bologna and other similar products, it is important that the diameter of the product used in the establishment\u2019s process is the same or smaller than that of the product used in the supporting documentation. If the diameter of the establishment\u2019s product is larger than that of the product used in the supporting documentation, it is possible that the product core will take longer to reach the desired temperature and pH, and a lower level of pathogen reduction would be achieved. b. Product formulation \u2013 Product formulation plays a role in the fermentation process and in the heat transfer during the intermediate heating step. Product formulation also may affect microbial resistance to acid or heat. The establishment should have an understanding of the critical operational parameters associated with the product formulation (e.g., % salt, moisture level, nitrite or any other preservatives, and % fat)

and should ensure that the material used in the supporting documentation is similar to their product with respect to those critical operational parameters.

c. Casing \u2013 The casing influences moisture exchange. Products with impermeable, semi-permeable, or permeable casings exchange moisture with the environment differently and can, therefore, influence the rate of product acidification, the penetration of heat into the interior of the product, and the maximum internal temperature reached by the product. Therefore, the establishment should ensure that the type of casing used in its process is the same as that used in the supporting documentation."]}, {"file\_name": "FSIS\_GD\_2013\_0007", "title": "Compliance Guide For Residue Prevention", "num": "FSIS-GD-2013-0007", "id": "534c538da5c2ae59b9946a9b32f46927ff92aacbdf1af529189cb8375e41b2e0", "corp\_us": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/Residue\_Prevention\_Comp\_Guide.pdf", "type": "pdf", "n\_pages": 12, "word\_count": 3615, "text\_by\_page": ["i FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 FSIS Compliance Guideline for Controlling Meat and Poultry Products Pending FSIS Test Results Table of Contents What is the purpose of this Compliance Guideline? The purpose of this guidance document is to help domestic establishments and importers of record comply with the Food Safety and Inspection Service\u2019s (FSIS) new policy that product FSIS tests for adulterants will not be allowed to move into commerce until acceptable results become available. Specifically, it articulates: \u2022 Which products and FSIS sampling and testing programs are subject to this policy; \u2022 How domestic establishments can meet FSIS\u2019s requirement for meat and poultry establishments to hold or control product when FSIS collects a sample; \u2022 How an establishment determines the amount of product it

needs to hold; \u2022 How importers of record can meet FSIS\u2019s requirement to hold or control product when FSIS collects a sample; and \u2022 How an importer of record determines the amount of product they need to hold. It is important to note that this Guideline represents FSIS\u2019s current thinking on this topic and should be considered usable as of its issuance. Guidelines will be continually updated to reflect the most current information available to FSIS and its stakeholders. Who is this Compliance Guideline designed for? This guidance is designed for all FSIS regulated meat and poultry establishments and importers of record whose products are subject to: \u2022 FSIS verification testing for pathogens or chemical residues considered adulterants in FSIS regulated products, and \u2022 FSIS verification of non-food safety consumer protection regulatory requirements (e.g., protein-fat-free and moisture in hams). Therefore, this guidance applies to most products subject to FSIS verification testing with the exception of raw products subject to routine FSIS verification testing for Salmonella or other pathogens (such as Campylobacter) and poultry carcasses or other raw poultry parts subject to routine FSIS verification testing for residues. The applicable domestic and import testing programs are outlined further in this document. How can I comment on this Compliance Guideline? FSIS is seeking comments on this guidance document as part of its efforts to continuously assess and improve the effectiveness of policy documents. All interested persons may submit comments regarding any aspect of this document, including but not limited to: content, readability, applicability, and accessibility. The comment period will be 60 days and the document will be updated in response to the comments. Comments may be submitted by either of the following methods:","FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 2 Federal eRulemaking Portal Online submission at regulations.gov: This Web site provides the ability to type short comments directly into the comment field on this Web page or attach a file for lengthier comments. Go to <http://www.regulations.gov> and follow the online instructions at that site for submitting comments. Mail, including - CD-ROMs, and hand- or courier-delivered items: Send to Docket Clerk, U.S. Department of Agriculture (USDA), FSIS, Patriots Plaza 3, 1400 Independence Avenue SW, Mailstop 3782, 8-163A, Washington, DC 20250-3700. All items submitted by mail or electronic mail must include the Agency name, FSIS, and document title: FSIS Compliance Guideline for Meeting Test & Hold Requirements. Comments received will be made available for public inspection and posted without change, including any personal information, to <http://www.regulations.gov>. Why is this policy being implemented? FSIS has asked, but had not required, official establishments and importers of record to maintain control of products tested for adulterants while waiting for receipt of all test results. FSIS has found, however, inconsistencies with those controls. Consequently, recalls have occurred because product was already in commerce by the time unacceptable test results came back from the laboratory. Therefore, FSIS announced that it is changing its procedures, and that products subject to this policy will not be able to enter commerce until receipt of all test results that bear on the determination as to whether those products are adulterated are received. For more information see the Federal Register Notice (77 FR 73401), announcing the final policy available at <http://www.fsis.usda.gov/OPPDE/rdad/FRPubs/2005-0044FN.pdf>. Guidance for domestic establishments on controlling meat and poultry products pending FSIS test results What domestic products are subject to this policy? Under the new policy, the following products tested by FSIS under domestic sampling and testing programs cannot move into

commerce until acceptable results become available: \u2022 Raw, non-intact beef or veal products such as ground beef, hamburgers, and patties and raw products that are components of non-intact products, including beef manufacturing trimmings, bench trim, heart meat, head meat, cheek meat, weasand meat, product from Advanced Meat Recovery (AMR) systems, low temperature rendered lean finely textured beef (LFTB), partially defatted beef fatty tissue, and partially defatted chopped beef, tested for E. coli O157:H7 and non-O157 Shiga-toxin producing Escherichia coli (non-O157 STEC); \u2022 Ready-to-eat (RTE) products tested for Listeria monocytogenes and Salmonella;,"FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 3 \u2022 RTE product that passed over food contact surfaces that have been tested by FSIS for the presence of Listeria monocytogenes or Salmonella; \u2022 Livestock carcasses tested for residue by FSIS of drugs, such as antibiotics, sulfonamides, or avermectins, or the feed additive carbadox under domestic sampling and testing programs; and \u2022 Products that are tested for non-food safety consumer protection verification (e.g., protein-fat-free and moisture in hams). The policy does not cover: \u2022 Raw meat or poultry products that FSIS has tested for Salmonella or other pathogens (such as Campylobacter) that FSIS has not designated as adulterants in those products and \u2022 Poultry carcasses subject to FSIS testing for drug residues. Because of the significant number of poultry carcasses in a lot, because of the economic effect of holding such a lot, and because, historically, FSIS has not seen residue problems in poultry tested for residues, such product would not need to be held from commerce pending acceptable test results (76 FR 19955). Can an establishment move product off-site pending final test results? Yes, an establishment is not required to hold product tested by FSIS for adulterants at the establishment, provided it has effective controls in place for it to move elsewhere under its ownership so that the product does not enter into commerce until the establishment receives acceptable results. NOTE: FSIS inspectors do not retain products tested by FSIS for adulterants pending test results; however, when FSIS inspection program personnel believe an animal may contain violative levels of residues, they will continue to deem it "U.S. Suspect," retain the carcass, and submit samples for residue testing. What does FSIS consider adequate controls when product is moved from the establishment prior to receipt of laboratory results? Establishments are to maintain the integrity of the lot and use any effective mechanism to control the product. Adequate controls may include company seals. The Agency will require establishments to document and support that they can control the product pending the availability of test results. FSIS personnel will verify this documentation at the time of sample collection. If the movement of product results in a change of ownership, then the product is considered to have entered commerce.","FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 4 When will FSIS consider domestic product to be in commerce? FSIS recognizes that the mark of inspection is pre-printed on the package label of many products, and that it is most efficient to allow the product to be packaged and labeled with the printed mark of inspection as part of the production process. FSIS will continue to allow meat and poultry establishments to package and label products sampled and tested for adulterants with the mark of inspection. However, such product will not be eligible for shipment into commerce until acceptable test results for adulterants are available. In addition, to move product off-site pending FSIS test results, establishments cannot complete preshipment review or transfer ownership of the product to another entity. When a meat or

poultry establishment completes a pre-shipment review (9 CFR 417.5(c)), the establishment indicates that it takes full and final responsibility for applying its Hazard Analysis and Critical Control Point (HACCP) controls to the product that it has produced. Pre-shipment review can be accomplished if the product is at a location other than the producing establishment, as long as the review of appropriate documents and compliance with 9 CFR 417.5(c) occurs before the product leaves the control of the producing establishment. If the establishment has completed pre-shipment review pending test results, and the results are positive, the establishment has produced and shipped adulterated product into commerce. What is the minimum amount of time product will have to be on hold or under control for pending FSIS test results? The following table summarizes the minimum number of days from receipt to when the result is received, depending on whether the result is determined to be acceptable or unacceptable by analysis type. KEY QUESTION Question: Can an establishment package and label products with the mark of inspection before acceptable test results for adulterants are available? Answer: Yes, FSIS recognizes that the mark of inspection is pre-printed on the package label of many products, and that it is most efficient to allow the product to be packaged and labeled with the printed mark of inspection as part of the production process. FSIS will continue to allow meat and poultry establishments to package and label products sampled and tested for adulterants with the mark of inspection. However, such product will not be eligible for shipment into commerce until acceptable test results for adulterants are available.", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 5 Analysis Minimum Number of Days from Receipt When the Result Is: Acceptable Unacceptable E.coli O157:H7 and non-O157 in raw beef products 2 4 Listeria monocytogenes in RTE products 3 6 Salmonella in RTE products 1 5 Residue (antibiotics, sulfonamides, or avermectins or the feed additive carbadox) in livestock 4\* Will depend on what is screened and the number and type of additional analyses required Non-food safety consumer protection verification Will depend on the type of analysis Will depend on the type of analysis \*Does not include the time (12 \u2013 24 hours minimum) it takes to freeze the sample prior to shipping to the laboratory. FSIS begins testing of all raw beef and RTE products for microbiological pathogen analysis, and all residue testing, the day of receipt, including Saturdays. Non-food safety consumer protection verification analyses are started Monday through Friday on the day of receipt; analysis of non-food safety samples received on Saturdays are started on Mondays. In regard to sample discards, any sample that the FSIS laboratory may discard would occur the day of receipt and would not increase turnaround times in any way. Official establishments can receive lab sample results from the Agency electronically. More information on the various FSIS laboratory methodologies including time-frames for receipt of results can be found in the Microbiological Lab Guidebook and the FSIS Analytical Chemistry Laboratory Guidebook available at: [http://www.fsis.usda.gov/Science/Guidebooks\\_&\\_Methods/index.asp](http://www.fsis.usda.gov/Science/Guidebooks_&_Methods/index.asp). How can an establishment determine the amount of product it needs to hold? The establishment is responsible for having a supportable basis to define the sampled lot. The sampled lot is the product represented by the sample tested for by FSIS. In order to limit the amount of product affected by a sample result, the establishment may be able to limit the size of the sampled lot on the day FSIS collects a sample. For sampling purposes, lots should be defined so that if a positive result is found on one lot, the product from the other lot would not be implicated. Two such lots are called (mutually) independent or microbiologically-independent lots. Guidance on

how to", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 6 define sampled lots by product and analysis type is provided below. Guidance for Determining Lot Sizes Guidance for determining lot sizes when FSIS collects a sample is provided for each domestic sampling and testing program below. This guidance can be used by establishments to limit the amount of product on hold when FSIS collects a sample.

Determining the Sampled Lot for Raw Beef Products Subject to E. coli O157:H7 and non-O157 Testing A production lot of raw beef products can be defined in many ways. FSIS does not recognize \u201cclean-up to clean-up\u201d alone as a supportable basis for distinguishing one portion of production of raw beef product from another portion of production. This is because shiga-toxin producing Escherichia coli (E. coli) (STEC) organisms such as E. coli O157:H7, E. coli O26, O45, O103, O111, O121 and O145 are generally not environmental contaminants and, therefore, would not be completely addressed through cleaning and sanitizing. Guidance for lotting different types of raw beef products is described. Raw beef products that are components of non-intact products FSIS samples and tests the following raw beef products that are components of nonintact products for E. coli O157:H7 and in some cases, non-O157 STEC: beef manufacturing trimmings, bench trim, heart meat, head meat, cheek meat, weasand meat, product from AMR systems, low temperature rendered lean finely textured beef (LFTB), partially defatted beef fatty tissue, and partially defatted chopped beef. Considerations that may be used to determine the sampled lot (alone or in combination) for these types of raw beef products include: \u2022 Any scientific, statistically based sampling programs for shiga-toxin producing Escherichia coli (STEC) organisms, particularly E. coli O157:H7, non-STEC, or their associated virulence markers (e.g., eae and stx genes) that the establishment uses to distinguish between segments of production; \u2022 Sanitation Standard Operating Procedures (Sanitation SOPs) or any other prerequisite programs used to control the spread of STEC cross-contamination between raw beef components during production. The following may lead to the cross-contamination between raw beef components during production: o improper sanitary dressing; o insanitary product contact surfaces on equipment such as machinery and employee hand tools; o improper employee hygiene; ", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 7 \u2022 Processing interventions that have been validated to limit or control STEC contamination; \u2022 Beef manufacturing trimmings and raw beef components or rework carried over from one production period to another (carrying rework over from one production period to another compromises microbiological independence between lots); and \u2022 Use of same source materials during different production periods (if the components are being generated at an establishment that is not a slaughter establishment), provided product from one supplier could not have crosscontaminated the product from the other. The following are examples of ways the official establishment can limit its lot size: An establishment could produce bench trim from primals that are then mechanically tenderized and cut into steaks. In order to limit the sampled lot to the bench trim, the establishment could trim the primals, apply a validated intervention to the primals, and then tenderize the primals and cut them into steaks. In the event that FSIS collects a sample of bench trim that is found to be positive, the establishment could support that the non-intact steaks were microbiologically independent using the processing intervention validated to control STEC contamination, provided the critical operational parameters of the intervention were implemented properly. Another example of how an establishment could lot

beef manufacturing trimmings would be by using a robust sampling and testing program in which the establishment samples every combo bin (or other unit of product up to 10,000 pounds) using the N60 sampling plan and tests each sample for *E. coli* O157:H7 or their associated virulence markers (e.g., eae and stx genes). In this case, each combo bin of beef manufacturing trimmings would be considered a lot. If FSIS were to collect a sample from one combo bin of product, and the sample was found to be positive for *E. coli* O157:H7 or a nonO157 STEC , the establishment could support the release of the other lots of product using the results of their own robust testing program. Such robust testing would also be a way for establishments to support microbiological independence of finished product produced from the same production lot of source materials from a single supplier that were found positive for *E. coli* O157:H7. For other raw, intact beef products that are components of non-intact products produced at slaughter establishments such as head meat, heart meat, and cheek meat, establishments often will lot product by slaughter day because of the use of common product contact surfaces that are not cleaned and sanitized until the end of the production day. In large establishments, components such as head meat, heart meat, and cheek meat are usually transported on a moving viscera table and in small establishments a viscera truck is often used. If these product contact surfaces are not cleaned between use, all product that came in contact with that equipment since the last clean-up is considered part of the same lot due to the opportunity for crosscontamination. Cleaning and sanitizing of product contact surfaces may be used as a factor in defining lot size in this case because the components were produced from one", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 8 or more carcasses slaughtered and dressed consecutively or intermittently within a defined period of time (e.g., production day). Therefore, any contamination should be limited within that defined period of time. In limited cases, a single carcass may be considered a stand-alone lot. This may occur in the limited cases when FSIS collects follow-up samples directly from the carcass in response to an FSIS positive sample. For example, FSIS will collect follow-up samples directly from the carcass at an originating slaughter establishment if that establishment sent carcasses to a receiving establishment that produced bench trim from those carcasses that was then used in ground beef which FSIS tested and found positive. Product from different carcasses can be considered as independent lots provided the meat from the carcasses from each lot was handled so as to not cross-contaminate one another. This includes having assurances that the carcasses were not co-mingled. In those cases only the sampled carcass would be held. If the establishment does not prevent carcasses from being commingled or does not have adequate controls to prevent cross contamination among carcasses, it will not be able to designate one carcass as a stand-alone lot for sampling. Raw non-intact beef products FSIS samples and tests raw non-intact beef products that meet the standard of identity for ground and chopped beef (9 CFR 319.15(a)), hamburgers (9 CFR 319.15(b)), and beef patties (9 CFR 319.15(c)) for *E. coli* O157:H7. The same considerations listed on pages 6-7 for determining the sampled lot of raw beef products that are components of non-intact products may be used to determine the sampled lot of raw non-intact beef products that FSIS samples and tests. NOTE: Additional guidance on sanitation practices beef grinders can implement to prevent the introduction of bacterial hazards into their process can be found on page 1 of the Sanitation Guidance for Beef grinders (available at [http://www.fsis.usda.gov/PDF/Sanitation\\_Guidance\\_Beef\\_Grinders.pdf](http://www.fsis.usda.gov/PDF/Sanitation_Guidance_Beef_Grinders.pdf)). The following are

examples of ways establishments can limit its lot size of raw ground beef products: An establishment may define lots by source materials. STEC organisms tend to contaminate source materials during the slaughter and dressing process and so any contamination in source materials would likely be supplier specific. This lotting practice would be acceptable if the product from one supplier does not cross-contaminate the product from the other. For instance, following the grinding of product from one supplier, the lines and equipment were sanitized before the product from the next supplier was processed. It is important to note that if multiple lots of raw ground beef product were produced from source materials from the same production lot of a single supplier, and some of this product was found positive for E. coli O157:H7, a scientific basis is necessary to justify why any raw ground product produced at the grinder from", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 9 those source materials should not be considered adulterated (67 FR 62333). Another example of how an establishment could lot ground beef would be by using a robust sampling and testing plan in which ground beef samples are collected in 65 gram grab portions every 30 minutes of processing and combined into 1 composite sample (five 65 gram samples would be combined into a 325 grams composite) to be tested for E. coli O157:H7 or their associated virulence markers (e.g., eae and stx genes). Using this plan, an establishment could lot product in 2.5 hour production segments and support microbiological independence for those segments. The recommendations and information discussed above regarding defining the sampled lot can also be found in the: \u2022 Guidance for Small and Very Small Establishments on Sampling Beef Products for E. coli O157:H7 found at: [http://www.fsis.usda.gov/PDF/Draft\\_Guidance\\_SVSP\\_sampling\\_for\\_ecoli.pdf](http://www.fsis.usda.gov/PDF/Draft_Guidance_SVSP_sampling_for_ecoli.pdf); \u2022 Compliance Guideline for Sampling Beef Trimmings for E. coli O157:H7 found at: [http://www.fsis.usda.gov/PDF/Draft\\_Guidelines\\_Sampling\\_Beef\\_Trimmings\\_Ecoli.pdf](http://www.fsis.usda.gov/PDF/Draft_Guidelines_Sampling_Beef_Trimmings_Ecoli.pdf); and the \u2022 Compliance Guideline for Establishments Sampling Beef Trimmings for Shiga Toxin-Producing Escherichia coli (STEC) Organisms or Virulence Markers found at: [http://www.fsis.usda.gov/PDF/Compliance\\_Guide\\_Est\\_Sampling\\_STEC\\_0512.pdf](http://www.fsis.usda.gov/PDF/Compliance_Guide_Est_Sampling_STEC_0512.pdf).

QUESTION Question: If an establishment produces two lots of ground beef from the same source materials and FSIS test results from one lot of product come back as unacceptable (e.g., positive for E. coli O157:H7), will the second lot of product need to be recalled if it was released into commerce? Answer: It depends. The Recall Committee evaluates all production factors and control measures and then determines the scope of the affected product subject to recall. If multiple lots of raw ground beef product were produced from source materials from the same production lot of a single supplier, and some of this product was found positive for E. coli O157:H7, a scientific basis is necessary to justify why any raw ground product produced at the grinder from those source materials should not be considered adulterated. Such a scientific basis could include establishment test results in which the establishment tested each lot for E. coli O157:H7 using a robust sampling and testing plan and found the other lot negative for E. coli O157:H7.", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 10 Alternative lot definitions In addition to the parameters described above which can be used to define the sampled lot, FSIS has provided establishments that have their own sampling and testing programs the option to reduce their lot size for beef manufacturing trimmings, other raw ground beef components, or raw ground beef products to one combo bin or other unit (e.g., box) on the day that FSIS conducts sampling provided that the

establishment: 1. Has a validated intervention for E. coli O157:H7 at a Critical Control Point (CCP) in the HACCP plan that covers the product or requires an intervention for E. coli O157:H7 at a CCP for that product\u2019s source materials; and 2. Samples and tests every production lot for E. coli O157:H7 and generally collects its samples of beef manufacturing trimmings, other raw ground beef components, or raw ground beef products across multiple combo bins or other sample units. If an establishment meets these criteria and reduces its lot size to a single combo bin or sample unit when FSIS samples the product, then FSIS will collect the sample from the single combo bin or unit. Establishments may also have written procedures to grind a minimum batch of product that represents the entire lot in a smaller grinder. To ensure that the sample is representative of the lot, establishments with these written procedures need to have supporting documentation that describes how the minimum batch is representative of the entire lot (e.g., includes an appropriate proportion of all types of trim used to produce the lot). As a general guide, the minimum batch size should not be less than 50 pounds. In order to reduce the sampled lot to this minimum batch size, establishments will need to meet the 2 criteria listed above. Determining the Sampled Lot for RTE Products Subject to Listeria monocytogenes and Salmonella Testing A production lot for RTE product is typically defined as all product produced from clean-up to clean-up unless the official establishment can support a smaller lot size. Unlike E. coli O157:H7 and non-O157 STEC, Listeria monocytogenes (Lm) primarily contaminates product from the production environment. Therefore, it is difficult for establishments to support that Lm did not contaminate all product produced since the last complete clean-up. If the establishment performs a complete cleaning and sanitizing (following the procedures in its Sanitation SOP) between lots, the lot size could be reduced.

Considerations that should be taken into account when determining lot size include RTE source materials used, frequency of cleaning and sanitizing, and processing steps employed. An example of RTE source materials would be the chicken used in a chicken salad. If the chicken is received from another establishment, and product from", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 11 the same bag or container is used in multiple lots, then the establishment should consider whether microbiological independence is maintained between lots. If one of the lots containing a common RTE source material tests positive by FSIS, a scientific basis is necessary to justify why the other lots should not be implicated (for example, the source material was not the cause of the positive). Establishments should also consider whether the re-use of brine between lots would affect microbiological independence. In addition, establishments should consider how processing steps affect microbiological independence between lots. For example, since Salmonella contaminate RTE products as a result of under-processing, if one lot of RTE product tests positive by FSIS, and another lot of product received the same lethality treatment, a scientific basis is necessary to justify why the later lot should not be implicated. NOTE: An official establishment may reduce its lot size on a day when FSIS collects a routine RTE sample, in order to facilitate holding the product, as long as the change does not interfere with FSIS\u2019s ability to collect a representative sample. For example, decreasing the lot size could impact FSIS\u2019s ability to collect the samples because Listeria monocytogenes works its way out of the equipment after 3 hours. As a result, if the establishment produces a very small lot on the day FSIS collects a sample when it typically produces a larger lot, then FSIS may not be able to collect a representative sample. Products produced in the same room could be

considered part of the same or different processing lots, depending on how the lots are separated. If the processing lines can be considered microbiologically and physically independent of one another (i.e., equipment, personnel, utensils, and RTE source materials are not shared among the lines), then they can be considered different lots. Likewise, products produced on the same line could be considered different processing lots if they are separated by a complete cleaning and sanitization, as well as the other factors described above. NOTE: Products stored in a common cooler would not necessarily be considered part of the same lot. However, the establishment\u2019s Sanitation SOP KEY QUESTION Question: If an establishment produces two lots of RTE product from the same source materials, and FSIS test results from one lot of product come back as unacceptable (e.g., positive for Listeria monocytogenes), will the second lot of product need to be recalled if it was released into commerce? Answer: It depends. If one of the lots containing a common RTE source material tests positive by FSIS, a scientific basis is necessary to justify why the other lots should not be implicated. For example, the establishment may be able to support that source materials received a lethality treatment in the final package. Therefore, post-lethality contamination with Listeria monocytogenes would not be possible.", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 12 should address possible cross contamination, especially if RTE and raw products are held in the same cooler. The guidance provided for determining the sampled lot for RTE products subject to Listeria monocytogenes and Salmonella testing can also be applied to determining the sampled lot of product when FSIS collects a food contact surface (FCS) sample for Listeria monocytogenes or Salmonella. Product that passes over the tested FCS will also need to be held pending test results because the product would be considered adulterated if it passed over a FCS that tested positive for Listeria monocytogenes or Salmonella. As with product samples, products produced in the same room but on different processing lines could be considered part of the same or different processing lots, depending on how the lots are separated. If a FCS tests positive on one line, and the establishment has supporting documentation that there is not cross contamination among the lines, then lots produced on the other lines may not be implicated. The guidance provided in this section can also be found in Chapter 3, Page 15 of the revised Listeria Guidelines available at [http://www.fsis.usda.gov/PDF/Controlling\\_LM\\_RTE\\_guideline\\_0912.pdf](http://www.fsis.usda.gov/PDF/Controlling_LM_RTE_guideline_0912.pdf). Determining Product Held for Livestock Carcasses Subject to Residue Sampling and Testing For chemical residues, only the sampled livestock carcass is typically held. That is because for chemical residues, lots typically are determined on a carcass basis during the slaughter operation, unless there is evidence of flock or herd application of the treatment. Although not required under this new policy, it is also recommended that establishments hold the specific poultry carcasses that are sampled for residues. Guidance for Importers of Record on controlling meat and poultry products pending FSIS test results What imported products are subject to this policy? Under the new policy, the following products tested by FSIS cannot move into commerce until acceptable results become available: \u2022 Raw, non-intact beef or veal products such as ground beef, hamburgers, and patties and raw products that are components of non-intact products including beef manufacturing trimmings, bench trim, heart meat, head meat, cheek meat, weasand meat, product from Advanced Meat Recovery (AMR) systems, low temperature rendered lean finely textured beef (LFTB), partially defatted beef fatty tissue, and partially defatted chopped beef tested for E. coli O157:H7 and non-O157 Shiga-toxin producing

Escherichia coli (non-O157 STEC); \u2022 Ready-to-eat (RTE) products tested for Listeria monocytogenes and Salmonella; ", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 13 \u2022 Livestock carcasses and other products other than raw poultry carcasses and parts subject to FSIS testing for residues; and \u2022 Products that are tested for non-food safety consumer protection verification (e.g., protein-fat-free and moisture in hams). The policy does not cover: \u2022 Raw meat or poultry products that FSIS has tested for Salmonella or other pathogens (such as Campylobacter) that FSIS has not designated as adulterants in those products and \u2022 Poultry carcasses or other raw poultry parts subject to FSIS testing for residues and pesticides. Can an importer of record move product from the official import inspection establishment pending receipt of final laboratory results? Yes, the importer of record can move imported product off-site from the official import inspection establishment provided the importer has controls in place that will ensure that product does not enter commerce until the importer of record receives notification of acceptable test results. NOTE: The policy regarding product assigned reinspection at the Intensified level has not changed. Lots of imported product that are assigned reinspection at the Intensified level are under FSIS hold and are not permitted to move off-site from the official import inspection establishment. What does FSIS consider adequate controls when product is moved from the official import inspection establishment prior to receipt of laboratory results? Importers of record are to maintain the integrity of the lot and may use any effective mechanism to control the product, including the use of company seals. The Agency will require importers of record to document that they can control the product pending the availability of test results and provide that documentation to FSIS personnel prior to moving the shipment off-site. When will FSIS consider imported product to be in commerce? If the movement of product results in a change of ownership from the importer of record that presented the product for FSIS reinspection at the official import inspection establishment to any other entity prior to receipt of laboratory results, or if the importer of record relinquishes ownership of the product before receiving the laboratory results, then the product is considered to have entered commerce. Both of these actions are violations of the test and hold provision. Therefore, the product may be subject to redelivery by Customs and Border Protection (CBP) or local Customs authority and to ", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 14 any fines or penalties imposed by such authority, as well as to enforcement actions by FSIS. NOTE: FSIS defines the importer of record as the named individual or company on the entry made with CBP or the local Customs authority. What actions will FSIS take on imported product that receives an unacceptable laboratory result? When the importer of record has maintained control of the product, and unacceptable results are reported, FSIS will refuse the product entry. The importer of record must make appropriate arrangements with FSIS to return the product to an official import inspection establishment to have the product marked as U.S. Refused Entry. The importer of record still has the option to re-export refused entry product. When the importer of record has NOT maintained control of the product, or ownership has changed, and unacceptable results are found, the importer of record has shipped adulterated product into commerce as the product is considered to be domestic product and is subject to recall. In addition, adulterated product in U.S. commerce is no longer eligible for re-exportation, and the importer of record is subject to FSIS enforcement action or sanctions, as appropriate. What is the minimum amount of time product will have to be on hold

or under control for pending FSIS test results? The following table summarizes the minimum number of days from receipt to when the result is received depending on whether the result is determined to be acceptable or unacceptable by analysis type. Analysis Minimum Number of Days from Receipt When the Result Is: Acceptable Unacceptable E. coli O157:H7 and non-O157 in raw beef products 2 4 Listeria monocytogenes in RTE products 3 6 Salmonella in RTE products 1 5 Residue (antibiotics, sulfonamides, or avermectins or the feed additive carbadox) and pesticides in livestock and poultry other than raw poultry carcasses or parts 4\* Will depend on what is screened and the number and type of additional analyses required Non-food safety consumer protection Will depend on the type of analysis Will depend on the type of analysis", "FSIS Compliance Guideline: Controlling Meat and Poultry Products Pending FSIS Test Results 2013 15 verification \*Does not include the time (12 \u2013 24 hours minimum) it takes to freeze the sample prior to shipping to the laboratory. FSIS begins testing of all raw beef and RTE products for microbiological pathogen analysis or for residues the day of receipt, including Saturdays. Non-food safety consumer protection verification analyses are started Monday through Friday on the day of receipt; analysis of non-food safety samples received on Saturdays are started on Mondays. In regard to sample discards, any sample that the FSIS laboratory may discard would occur the day of receipt and would not increase turnaround times in any way. Official import inspection establishments can receive lab sample results from the Agency electronically. More information on the various FSIS laboratory methodologies including time-frames for receipt of results can be found in the Microbiological Lab Guidebook and the FSIS Analytical Chemistry Laboratory Guidebook available at:

[http://www.fsis.usda.gov/Science/Guidebooks\\_&\\_Methods/index.asp](http://www.fsis.usda.gov/Science/Guidebooks_&_Methods/index.asp). How does an importer of record determine the amount of product he or she needs to hold? The sampled lot is the product represented by the sample tested by FSIS, which is the defined lot on the foreign inspection certificate. As with domestic product, for lotting purposes, lots are defined so that if a positive result is found on one lot, the product from the other lot would not be implicated. Two such lots are called independent or microbiologically-independent lots. A lot of imported product is determined by the information provided by the foreign inspection system on the foreign inspection certificate and cannot be altered at point of entry reinspection. Therefore, it is critical that the importer of record work with the foreign establishment in regard to how product is lotted."]}, {"file\_name": "FSIS\_GD\_2013\_0008", "title": "\"At Least Equal To\" Compliance Guideline for State Meat and Poultry Inspection (MPI) Programs for Laboratory Methods", "num": "FSIS-GD-2013-0008", "id": "be3bc631a2090b1766f67b59eb3e3ff6708e256384935bc93b193d3b9d673897", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/At-Least-Equal-to-Guide-MPI-Programs-Lab-Methods.pdf", "type": "pdf", "n\_pages": 6, "word\_count": 1617, "text\_by\_page": ["FSIS Hold and Test Conference Call with Industry (February 7, 2013) 1. Will FSIS be implementing new procedures so that importers of record will need to maintain control of imported meat and poultry product pending the results of FSIS tests for adulterants, including residues? Yes. FSIS has emphasized the importance of Agency port-of-entry testing for adulterants, including residues. Effective February 8, 2013, FSIS will not allow product that it tests for adulterants to enter commerce in the U.S. until test results become available. FSIS labs will expedite the"]}

availability of test results to the extent practical, and FSIS will issue any additional necessary instructions to import inspection personnel to ensure the new policy and procedures are effectively implemented. 2. Does fresh product that is subject to residue testing at reinspection need to be frozen prior to being submitted to the labs for testing? No. Import inspection personnel have the option to submit residue samples frozen or cold to the designated laboratory. FSIS will issue instructions re-emphasizing that fresh product sampled for a residue does not need to be frozen. 3. Can a lot of fresh product presented for FSIS reinspection and assigned a laboratory residue type of inspection (TOI) be withdrawn and returned to Canada, (e.g., canceling the import application)? No. The shipment would be U.S. Refused Entry because it was presented to FSIS for reinspection as required and denied the sampling TOI assigned to that lot. 4. Can a lot of fresh product presented to FSIS for reinspection and assigned a laboratory TOI be controlled by returning it to the production facility in Canada? No. However, the product could move under control of the importer to a facility in the United States for storage until acceptable results on the sampled lot are received. 5. What defines a lot? Lot groupings are based on the product species, process\product category, and product group, which are identified and certified on the foreign inspection certificate. Importers (or agents) should coordinate with the exporting establishment in the foreign country to designate lots during the certification process in the foreign country. This question was addressed in a response to question number 15 of a previous Q & A posted on the FSIS web site at:

[http://www.fsis.usda.gov/PHIS/PHIS\\_Import\\_Q&A\\_050212/index.asp](http://www.fsis.usda.gov/PHIS/PHIS_Import_Q&A_050212/index.asp) 6. Can importers of record receive LEARN results? Not at this time. The importer of record and customs broker may provide an email on the import application to receive lab results. FSIS import inspection personnel receive results and communicate them to the official import inspection establishment. 7. Are sampling rates changing? No. FSIS sampling protocols and rates of sampling are not changing with the test and hold policy. 8. Can beef product found E. coli O157 and non-O157 STEC positive at reinspection be diverted to an official establishment for thermal lethality treatment? No. That product is adulterated and cannot enter commerce in the U.S. The positive lot is U.S. Refused Entry with the standard disposition options available, including re-export.", "FSIS Hold and Test Conference Call with Industry (February 7, 2013) 9. Can U.S Refused Entry product be re-exported to a third country? Yes, however FSIS would provide notification to the competent authority where the U.S. Refused Entry shipment is destined. 10. Can the sampled lot be moved to the final destination and controlled at an official establishment pending FSIS results for adulterants? Yes, the importer of record must maintain ownership of the product and ensure the product does not enter commerce until acceptable lab results are received. Imported product destined for further processing and stored at an official establishment under control of the importer cannot be further processed until acceptable lab results are received, as this product would be considered to have entered commerce. 11. Are fully cooked products required to be held under the new policy and procedures? Yes, ready-to-eat (RTE) products are subject to the new policy and procedures when sampled for adulterants. The importer of record would need to maintain control of the product pending receipt of acceptable analysis results. 12. The change in ownership may occur prior to filing the Customs entry, though the original importer of record proceeds with filing the entry. What impact does this have on this policy? The importer of record that files the entry with CBP is the responsible party that must maintain adequate control of the product, so that it

plans: domestic and import. These plans are further divided to facilitate the management of chemical residues such as veterinary drugs, pesticides, and environmental contaminants in meat, poultry, and egg products. The domestic sampling plan includes scheduled sampling and inspector-generated sampling. The import reinspection sampling plan is separated into normal sampling, increased sampling, and intensified sampling. With the implementation of the Hazard Analysis and Critical Control Points (HACCP) system, another important component of the NRP is to provide verification of residue control in HACCP systems. As part of the HACCP regulation, slaughter and production establishments are required to identify all chemical residue hazards that are reasonably likely to occur and develop systems to guard against them. An effective chemical residue prevention program is essential to foster the prudent use of veterinary drugs and pesticides in food animals. In 1999, the NRP was modified to make residue evaluation more consistent with risk assessment principles. The USDA Office of Inspector General (OIG) determined in its review of the FSIS National Residue Program for Cattle, dated January 29, 2010, that the FSIS National Residue Program for Cattle is not meeting its objective of preventing residues from entering the food supply. The OIG report identified slaughter establishments that", "5 continue to purchase livestock from repeat violator producers as one issue contributing to the residue problem. Another issue identified as a problem is the lack of cattle identification available at slaughter that can be associated to the producer. The review further determined there are two slaughter classes of livestock (dairy cows and bob veal) that contribute 90 percent of the residues found in animals presented for slaughter. For this reason, this compliance guide is primarily focused on cull dairy cows and bob veal. Furthermore, on July 6, 2012, FSIS announced changes to the NRP (77 FR 39895). Most significantly, FSIS began analyzing fewer samples but by using multi-residue methods. FSIS now uses multi-residue techniques to quantify a larger number of analytes with greater precision and accuracy. Such methods can often be performed with faster throughput and at lower cost to the Agency than conventional single residue methods.

III. Regulatory Requirements Establishments are required, under 9 CFR 417.2 (a), to conduct a hazard analysis and consider the food safety hazards that might be expected to arise from drug residues. Establishments are also required to maintain documentation that supports the decisions made in their hazard analysis as a part of their records under 9 CFR 417.5 (a) (1). FSIS expects, as it has since HACCP was implemented, that establishments will verify the ongoing effectiveness of their residue programs under HACCP per 9 CFR 417.4 (a). Establishments that determine in their hazard analysis that the food safety hazard \u201cdrug residues\u201d is not a hazard reasonably likely to occur are required under 9 CFR 417.3 (b) (4) to reassess their HACCP plan each time a violative drug residue is found by FSIS. With repeated violations it becomes increasingly difficult for establishments to support the decision that drug residues are not reasonably likely to occur. As a part of an effective HACCP system, an establishment should consider whether the producer of the animals it is considering for purchase has a history of residue violations. Because it is not possible to know for sure whether an animal contains a drug residue that would cause FSIS to condemn the carcass, an establishment\u2019s best indicator of whether the animal may have such a residue is past practice by the producer. A producer who has had more than one residue violation in the preceding 12 months may be more likely than other producers to be selling additional animals with violative residues. Therefore, it is prudent for an establishment to purchase livestock with adequate identification to trace back to the producer. This information

will enable the establishment to determine whether the producer appears on the most recent Residue Repeat Violator List for Establishments and Livestock Auctions (Residue Repeat Violator List). The Residue Repeat Violator List is composed of suppliers who have had", "6 more than one residue violation in the preceding 12 months. FSIS began compiling and publishing the Residue Repeat Violator List in August 2009 in response to an industry request. FSIS updates the listing weekly and when properly used, this information can be a valuable tool for assisting slaughter establishments in avoiding illegal residues in animals they slaughter by identifying livestock from known producers of repeat violator animals. If an establishment regularly purchases animals from a particular livestock market, it may obtain a general certification from the market stating that market personnel check all animals sold at that market against the Residue Repeat Violator List and notify potential buyers of animals from producers whose names appear on that list. This certification may also identify those animals from a producer known to be on the Residue Repeat Violator List. As an alternative to a general certification, particularly if the establishment purchases cattle from a livestock market, establishments should obtain a letter or some other type of credible certification from the seller or livestock market or auction that states that the animals in question either are or are not from a supplier who has had more than one residue violation in the last 12 months. A person or firm that is on the Residue Repeat Violator List remains eligible to market its livestock for slaughter. An establishment may present for slaughter animals from producers on the FSIS Repeat Residue Violator List, but it must have effective controls in place to ensure that any carcasses with violative residues are not allowed into commerce. An official establishment would need to be aware of when it receives livestock from a person or firm on the Residue Repeat Violator List in order for it to be able to design and implement its food safety program to address the potential hazard of an illegal residue. An establishment that receives a certification from the seller that the animal is not from a producer with a history of residue violations should keep the certification in its HACCP records, but they should ensure each time it intends to purchase animals from the market that the market has performed an appropriate review of the list. Without producer information or appropriate certification, it is not possible for an establishment to institute effective preventive measures. If an establishment does not follow this guide and FSIS finds violative residues, the establishment\u2019s HACCP system may be inadequate under 9 CFR 417.6.", "7 IV. Residue Prevention Recommendations In a Federal Register notice entitled \u201cResidue Control in a HACCP Environment\u201d (70 FR 70809, November 28, 2000), FSIS listed four practices available to slaughter establishments to avoid slaughtering animals that contain illegal residues: ensure that all animals brought into an establishment for slaughter are identified, so that they can be traced back to the producers; notify animal producers in writing of both violative and high, though not violative, residue findings, with such notification including a discussion of the issues involved, the company\u2019s (slaughter establishment\u2019s) future expectations, and an indication that repeat violators will not be future suppliers; explore the possibilities for the establishment to require purchase specifications including voluntary residue avoidance programs; and explore live animal testing. These four preventive practices are still relevant to prudent establishments and are entailed and reaffirmed in this guide. FSIS is specifically emphasizing in this guide that establishments, especially those that slaughter dairy cows and bob veal calves, should apply five basic measures, which expand upon and further clarify the four practices listed in the

Federal Register notice, to prevent the occurrence of violative residues.

1. Confirm producer history

An establishment should have an effective residue control program that includes measures that takes into account the historical residue violation information associated with producers. A livestock producer is the individual, farm, dairy, ranch, feed yard or other firm from which the animal originates. The establishment can access the Residue Repeat Violator List to obtain the list of repeat violator producers prior to purchasing the cattle. FSIS has determined that a letter or certification from the seller, livestock market, or auction on a lot-by-lot basis demonstrating that the person issuing the letter or certification has reviewed the most recently posted Residue Repeat Violator List and determined that none of the animals in the lot came from suppliers with more than one violation in the last 12 months is a way that slaughter establishments can protect themselves. In addition, as discussed above, if an establishment regularly purchases livestock from a market, instead of getting a certification for each lot, it may decide to obtain a general certification that the market will check the list for each lot, although the establishment should regularly ensure that the market is adhering to this certification. In addition, this documentation may also identify those animals from a producer known to be on the Residue Repeat Violator List. An establishment that does not use the information in the Residue Repeat Violator List, either directly or through a letter or certification, would not be taking advantage of a tool", "8 for identifying livestock from known repeat violators. Thus, the establishment would not be taking advantage of a means of controlling a hazard that is foreseeable.

2. Purchase animals that are free from violative residues

An establishment should purchase animals from producers that have a history of providing residue-free animals, that employ an effective residue prevention program, and that use drugs judiciously by avoiding unnecessary or inappropriate use. In addition, an establishment should require documentation from the producer that the animals are \u201cfree from violative residues.\u201d The Food and Drug Administration recommends in guidance on Judicious Use of Medically Important Drugs that producers limit use in food-producing animals of medically important antimicrobial drugs to cases when such use is necessary to ensure animal health and then only with veterinary oversight or consultation.

3. Ensure animals are adequately identified

FSIS encourages slaughter establishments to purchase animals with sufficient identification, such as ear tags or back tags, to trace back to the producer and not to purchase any cattle that do not have identification that would allow them to be traced back to the farm of their origin. Cattle should be consistently identified with ear tags or back tags, and that identification has to be maintained with the cattle through the slaughter process until post-mortem inspection is complete. Maintaining proper identification of cattle enables accurate trace back to the producer that can be upheld in a court of law if necessary. FSIS acknowledges that incidental loss of back tags does occur while livestock are in transport and holding areas. If back tags do not work in certain situations, other means of identification like producer ear tags, feedlot identification tags, tattoos, and calf-hood tags (\u201cbangs\u201d) should be considered. Without adequate identification, neither the establishment nor FSIS can utilize herd history to determine how likely cattle are to have violative levels of chemicals. Cattle that do not have animal identification may have had the identification intentionally removed in an effort to obscure their origin. If someone has attempted to obscure the origin of the cattle, FSIS would be concerned about a possible higher risk that these animals contain violative residues. Because of this risk, FSIS Notice 44-12

instructs inspection program personnel to perform in-plant screening tests at an increased frequency if an establishment is not able to demonstrate that it has put in place measures designed to prevent or reduce the possibility that it will receive animals for slaughter with a violative residue. Thus, when cattle are not identified to the producer at ante-mortem inspection, given the Agency's experience with such livestock, FSIS is likely to test such animals on a more frequent basis (up to 100 percent). 4. Supply the producer information to FSIS at ante-mortem inspection When producer information or other assurances are not available at ante-mortem, or when the cattle are purchased from a producer listed on the Residue Repeat Violator List, FSIS is likely to screen test the cattle at a higher rate and may test up to 100 percent. If FSIS is presented with producer information or a letter or certification from the seller, livestock market, or auction, on a lot by lot or other appropriate basis, demonstrating that the person issuing the letter or certification reviewed the most recently posted Residue Repeat Violator List and determined that none of the animals in the lot came from suppliers with more than one violation in the last 12 months, FSIS is likely to screen test the cattle at a lower rate. 5. Notify Producers of Violative Animals Slaughter establishments are notified through the FSIS Public Health Information System (PHIS) of both violative residues and of residues that are detectable but that do not exceed the tolerance levels established by FDA and EPA. Slaughter establishments should notify animal producers in writing if their animals are found either with violative or non-violative levels of a drug residue. Persistent non-violative residues may indicate a pattern of usage that could result in violations at some point. Such notification should include a discussion of the issues involved, the company's future expectations, and an indication that repeat violators will not be future suppliers. V. Comments and Responses In April 2012, FSIS announced the availability of a compliance guide for residue prevention (77 FR 24671) and requested comment on the guide. FSIS received a total of 12 comment letters in response to the April 2012 notice from professional veterinary associations, national trade organizations, private citizens, and an animal welfare advocacy organization. In response to the comments it received, FSIS has updated the compliance guide by substituting "residue free" and "drug free" with the phrase "free from" violative residues. In addition, FSIS has included a discussion of means of livestock identification other than those discussed in the initial guidance that should be considered by livestock slaughter establishments when back tags are lost and prove ineffective in maintaining the identity of the animals. Following is a summary of the comments and FSIS's responses.

**Comment:** Several comments stated that only a small percentage of livestock receiving a back tag at the livestock market or sale barn actually retain those tags all the way to slaughter. One comment estimated that 80 percent of back tags placed on swine fall off before the animals are presented for slaughter. Several comments conjectured that if processors refuse to purchase animals without identification as recommended by FSIS, owners of animals that unwittingly lose their back tags while in transit or holding pens will be denied market access. As an alternative to back tags, two comments requested that FSIS mandate the use of permanent ear identification tags in swine.

**Response:** FSIS acknowledges that incidental loss of back tags does occur while livestock are in transport and holding areas. However, FSIS believes, in some cases, back tags prove to be an acceptable form of identification. If back tags do not work in certain situations, FSIS recommends that establishments use other means of identification, like producer ear tags, feedlot identification tags, tattoos, and calf-hood tags.

(\u201cbangs\u201d). FSIS amended the guide to address animal identification options for establishments to consider when incidental loss of back tags occurs. FSIS has limited authority to mandate the use of specific identification devices, permanent or otherwise, on livestock presented for slaughter. Therefore, FSIS does not intend to propose changes to its regulations to require specific identification devices at this time. Comment: Several comments opposed FSIS\u2019s recommendation that slaughter establishments notify animal producers if their animals are found to have non-violative levels of a drug residue because the information will likely confuse producers. Response: On November 28, 2000, FSIS informed establishments that if their HACCP plans included residue controls that incorporate the best available preventive practices for slaughter establishments, if they implement those controls effectively, and if they supply FSIS with information about violators, then the Agency will not treat violative residue findings by the establishment that are followed by appropriate corrective actions as noncompliance (65 FR 70809). The Federal Register notice went on to recommend that slaughter establishments notify animal producers in writing of both violative and non-violative residue findings as one of several \u201cbest preventive practices.\u201d As reaffirmed in the compliance guide, FSIS believes that such an approach will result in a decrease in violative residue findings because evidence of non-violative residues is an indication of lack of care in drug use by that producer. Comment: Several comments requested that FSIS resume publishing the Residue Violator List in addition to the revised Residue Repeat Violator List. According to the comments, information contained within the discontinued Residue Violator List was used by certain trade organizations to target outreach on residue avoidance to reduce the probability that a repeat violation would occur. Response: In 2011, to avoid confusion, FSIS stopped publishing the monthly Residue Violator (Alert) List that included the names of any producer, including first-time offenders, with a residue violation in the previous 12-months. FSIS replaced that list with the Residue Repeat Violator List. Published weekly, the Residue Repeat Violator List identifies producers who repeatedly (i.e., on more than one occasion) within a 12month period have sold animals for slaughter whose carcasses were found by FSIS to contain a violative level of a chemical residue.", "11 FSIS recognizes that posting the name of a livestock producer to a publicly-available list of residue violators may potentially result in significant economic harm to that producer. Moreover, the incentive of removal of the producer\u2019s name from the Residue Repeat Violator List, which motivates repeat violators to improve their operations to prevent violative residues, will be weakened if producers with only one violation are listed on the web site. Finally, FSIS notes that many first-time residue violators do not go on to become repeat violators within the designated 12-month period. Therefore, FSIS does not intend to resume publishing names of producers with a single violation within a 12month period. Comment: Because producers or suppliers can sell livestock to multiple Federal establishments, one comment suggested FSIS consolidate residue test results from the supplier or producer and set an acceptance level of non-violative samples that would trigger removal of a producer from the Residue Repeat Violator List rather than use a hard 12-month timeframe. Response: FSIS would need to evaluate existing data to set a level of acceptable non-violative residue sample results that would trigger removal of a producer from the Residue Repeat Violator List. Given the time and resources that it would take to perform this evaluation, FSIS finds that the passage of time without a violation remains the appropriate criterion for removal from the list and is not making any changes to the Residue Repeat Violator

list at this time. Comment: Two comments requested that FSIS amend the compliance guide by substituting \u201cresidue-free\u201d and \u201cdrug residue free\u201d with the phrase \u201cfree from violative residues\u201d. Response: FSIS agrees with the suggested changes and has modified the compliance guide accordingly. Comment: Two comments expressed various concerns about drug residues in horses destined to be slaughtered for human consumption. Response: In January 2010, the USDA Office of Inspector General determined in its review of the FSIS National Residue Program for Cattle that cull dairy cows and bob veal account for 90 percent of the residues found in animals presented for slaughter. Therefore, the guide focuses primarily on establishments that slaughter these livestock. However, this guide will be useful to any establishments that slaughter horses under Federal inspection in the future. By following the recommendations in the guidance, horse slaughter establishments would employ practices that help them avoid receiving horses with residues", "12 VI. Additional Information", "\u2022 Purpose This Compliance Guideline supplements the \u201cAt Least Equal To\u201d Compliance Guidelines for State Meat and Poultry Inspection (MPI) programs. It specifically supplements the guidance material in Component 3 - Product Sampling, of the guideline in that it provides additional instruction and recommendations on product sampling, laboratory methods and quality assurance.", "\u2022 II. Background FSIS has entered into cooperative agreements with various states that administer their own MPI programs in a manner that is \u201cat least equal to\u201d the Federal inspection program. To be \u201cat least equal to\u201d the Federal inspection program, the State programs need to have product sampling and laboratory methods with capabilities and safeguards that are \u201cat least equal to\u201d FSIS\u2019s sampling and methods. Hence, the State MPI programs should update and maintain their", "\u2022 Page 6", "\u2022 Page 2 of 6 I."]}]

laboratory microbiological and chemical detection methods so they are \u201cat least equal to\u201d the applicable FSIS guidebook methods. FSIS has integrated ongoing documents and on-site reviews of the applicable analytical methods in its annual comprehensive review of State MPI programs. Based on these reviews, FSIS will determine whether a participating State MPI testing program is \u201cat least equal to\u201d the corresponding FSIS testing program. FSIS plans to begin using the criteria in this guidance as part of the Federal Fiscal Year (FY) 2014 review cycle. Each State MPI program needs to submit its FY 2014 self-assessment by November 15, 2013. FSIS will evaluate whether the information submitted by a State as part of the FY 2014 assessment meets the criteria in this guidance.

III. Criteria for \u201cAt Least Equal To\u201d Laboratory Methods

To achieve and maintain \u201cat least equal to\u201d laboratory methods, each State MPI program should meet the criteria in the following three areas:

- (1) Program Sampling and Reporting, (2) Laboratory Quality Assurance Programs, and (3) Laboratory Testing Methods.

Sampling methods should provide analytical results \u201cat least equal to\u201d corresponding FSIS testing programs. Each State program should provide documentation through self-assessment and on-site review to FSIS that demonstrate that its program includes the following:

- 1) Program Sampling and Reporting

The sampling methodology, including the matrices and tools used, is effective for generating meaningful and consistent data.

\u2022 The program ensures sample integrity and identity. Laboratories that analyze samples for State MPI programs should maintain procedures to ensure that samples are not compromised within the laboratory. These procedures should include a documented chain of custody as well as traceability to the sample, equipment, and critical supplies used to analyze the sample. . .", "Page 3 of 6 \u2022 The program demonstrates confidence in test results and does not re-sample or re-test pathogen-positive and non-compliant products.

\u2022 Official test results are reported directly to the State MPI program in a timely manner.

- 2) Laboratory Quality Assurance (QA) Programs

State MPI program laboratories, or contract laboratories, should have an appropriate quality assurance (QA) program \u201cat least equal to\u201d the program maintained by FSIS laboratories to ensure the reliability and integrity of analytical results. State MPI program laboratories, or contract laboratories, should ensure that each laboratory meets the criteria outlined in the attached FSIS MPI Program Laboratory Quality Management System Checklist.

Laboratory QA program assessment consists the following:

- \u2022 Documented program of quality control procedures and ensure that these procedures are followed.
- \u2022 Properly trained personnel, suitable facilities and equipment, and verified, calibrated, and maintained equipment in a manner consistent with international norms (e.g. European cooperation for Accreditation (EA) 04/10 or Analytical Laboratory Accreditation Criteria Committee (ALACC) guidance).
- \u2022 Appropriate proficiency testing schemes for food analysis.
- \u2022 Use of validated method protocols.
- \u2022 Reporting and recordkeeping capabilities that can clearly track and link a test result to the correct establishment.

- 3) Laboratory Testing Methods

Standard methods are available in the USDA FSIS Microbiology Laboratory Guidebook (MLG), USDA FSIS Chemistry Laboratory Guidebook, FDA Bacteriological Analytical Manual, International Organization for Standardization (ISO) Methods, and Association of Analytical Communities (AOAC) Official Methods of Analysis.

Methods used in support of the State MPI program should be validated for the product type sampled. State MPI programs should provide documentation necessary to explain the methods used and the scientific basis for their (or the other testing laboratory's) selection. Such

documentation should include detailed testing method protocols, supplemental testing procedures, and evidence of method validation for microbiology methods and sustained proficiency testing for chemistry methods. Method assessment by FSIS considers the following: Microbiology \u2022 Methods of analysis have been designed to detect the lowest possible level of stressed pathogens from meat, poultry, and environmental samples (e.g., the method includes an enrichment step). \u2022 Methods of analysis have been validated through an experimental study. When methods have been modified, it may be necessary to conduct a supplemental validation. For validation studies conducted outside AOAC, Association Fran\u00e7aise de Normalisation (AFNOR), the French national organization for standardization, or similar organizations, please refer to \u201cFSIS Guidance for Evaluating Test Kit Performance. 10/15/10\u201d at the following link:", "Page 4 of 6  
[http://www.fsis.usda.gov/wps/wcm/connect/966638c7-1931-471f-a79e4155ce461d65/Validation\\_Studies\\_Pathogen\\_Detection\\_Methods.pdf?MOD=AJPERES](http://www.fsis.usda.gov/wps/wcm/connect/966638c7-1931-471f-a79e4155ce461d65/Validation_Studies_Pathogen_Detection_Methods.pdf?MOD=AJPERES)

\u2022 Methods of analysis detect the same target pathogens as the corresponding FSIS MLG method. That is, alternative methods should be inclusive for strains defined as positive by the biochemical, genetic, and serological confirmation tests described in the MLG. \u2022 Methods of analysis use appropriately sized test portions or sampling methodology and frequency for samples that offer enhanced opportunity for detecting foodborne pathogen contaminations. For information on the test portions used for FSIS testing programs, refer to FSIS laboratory method protocols available from the FSIS Microbiology Laboratory Guidebook website at the following link:

<http://www.fsis.usda.gov/wps/portal/fsis/topics/science/laboratories-and-procedures/guidebooks-and-methods/microbiology-laboratory-guidebook> \u2022 If additional non-validated confirmatory tests are performed by the laboratory, those tests should not be relied upon to invalidate the previous results. \u2022 Shipping enrichments to a second confirmatory laboratory should be avoided. FSIS guidance for evaluating microbiological testing methods can be found in FSIS Directive 5100.1 Rev. 3 Attachment 1 \u201cEvaluation of Microbiological Methods Used by Establishments\u201d at the following link:  
[http://www.fsis.usda.gov/wps/wcm/connect/868cc16e-8dae-48e2-a3c4898d77f4a0a0/Attachment1\\_5100.1Rev3\\_Methods.pdf?MOD=AJPERES](http://www.fsis.usda.gov/wps/wcm/connect/868cc16e-8dae-48e2-a3c4898d77f4a0a0/Attachment1_5100.1Rev3_Methods.pdf?MOD=AJPERES) Food Chemistry \u2022 Methods of analysis should be capable of measuring food chemistry components as a percentage of sample weight. Moisture, protein, fat, and salt should be included. FSIS conducts limited food chemistry analysis of products at official establishments when in-plant inspection personnel believe the product is misbranded. \u2022 Acceptable methods of analysis are available on the FSIS Chemistry Laboratory Guidebook website at the following link:  
<http://www.fsis.usda.gov/wps/portal/fsis/topics/science/laboratories-and-procedures/guidebooks-and-methods/microbiology-laboratory-guidebook> \u2022 AOAC Official Methods of Analysis for food chemistry are also acceptable. \u2022 Alternative methods for food chemistry analysis are acceptable, provided they measure the same components with sufficient accuracy. Evidence to support use of an alternative method would include proficiency-testing data generated by the State MPI laboratories or contract laboratories completing the analysis. \u2022 The FSIS Accredited Laboratory Program (ALP) provides proficiency-testing services for food chemistry. For further information, visit the following link:

<http://www.fsis.usda.gov/wps/portal/fsis/topics/science/laboratories-and-procedures/accreditedlaboratories/accredited-laboratories> \u2022 Information on in-plant screening of residues in meat and poultry products is available at the following link:  
[http://www.fsis.usda.gov/wps/wcm/connect/c2329ec8-a3fc-4581-8302dd71aa66e0a8/Compliance\\_Guide\\_At\\_Least\\_Equal\\_to\\_Residue\\_Testing\\_122112.pdf?MOD=D=AJ PERES](http://www.fsis.usda.gov/wps/wcm/connect/c2329ec8-a3fc-4581-8302dd71aa66e0a8/Compliance_Guide_At_Least_Equal_to_Residue_Testing_122112.pdf?MOD=D=AJ PERES), "Page 5 of 6 IV. Submission of Laboratory Methods To initiate the review process, State MPI programs should submit their current laboratory methods on or before November 15, 2013, as part of the FY 2014 self-assessment submissions. In subsequent years, State MPI programs should submit a list of their current laboratory methods and copies of new or revised methods as part of the self-assessment submission process. In the submission, State MPI program Directors should divide the document submissions into Microbiology methods, Chemistry methods, and QA records. All three sections should be submitted electronically to the FSIS Outlook mailbox: [Statelabinquiry@fsis.usda.gov](mailto:Statelabinquiry@fsis.usda.gov) If hard copies must be submitted, please mail them to the following address: Director, USDA, FSIS, OPHS, Laboratory Quality Assurance Staff 950 College Station Road Athens, Georgia 30605 Phone: (706) 546-3559 FSIS also recommends that States submit a completed FSIS MPI Program Laboratory Quality Management System Checklist available at the following link:  
<http://www.fsis.usda.gov/wps/wcm/connect/b31678b7-0822-4081-bc9a-bf483403851f/State-MPI-Lab-Quality-Mgmt-SysChecklist.pdf?MOD=AJPERES> or similar information for each laboratory performing MPI-related analyses. Records related to FSIS on-site reviews should be submitted to the FSIS Outlook mailbox. NOTE: State laboratories that are accredited to ISO 17025 with all applicable methods under their scope of accreditation may provide their current certificates of accreditation in lieu of the QA checklist. While use of contract laboratories to meet analytical requirements is acceptable, the contract laboratory should meet the same requirements as described for State MPI program laboratories. The State MPI program laboratories and their contract laboratories are subject to periodic on-site reviews by FSIS to evaluate the QA program in comparison to written submissions and to verify the accuracy and implementation of the laboratory methods. V. Additional Information Questions regarding laboratory methods can be submitted through AskFSIS using the following link:  
<http://askfsis.custhelp.com/> When submitting a question, use the Submit a Question tab, and enter the following information in the fields provided: Subject Field: Enter Laboratory Methods", "Page 6 of 6 Question Field: Enter your question with as much detail as possible. Product Field: Select General Inspection from the drop-down menu. Category Field: Select Cooperative State Inspection Programs from the drop-down menu. Policy Arena: Select Domestic (U.S.) Only When all fields are complete, press the Submit button. VI. This guidance document should be particularly useful to very small operations in selecting a microbiological testing laboratory. FSIS previously issued this guidance in March 2012 with a request for comments. In response to the comments it received, FSIS has revised the guidance to: \u2022 Clarify that laboratories that meet ISO 17025 accreditation would also meet the guidelines provided by FSIS in this guidance document; \u2022 Compile a Web-based list of methods that have been externally validated for the detection of foodborne pathogens and included information and a hyperlink to this list; \u2022 State that proficiency testing (PT) should be performed on a regular basis (two to three times annually) and that PT may be used to evaluate the laboratories\u2019 accuracy, precision, and efficiency. PT may also be used as a means to evaluate individual analyst competency; \u2022 Add more questions on PT requirements to the Laboratory Assessment Checklist for establishments to ask laboratories when evaluating if a laboratory is capable of producing accurate and reliable results; \u2022 State that negative controls may be helpful in some circumstances. For example, as a negative control, laboratories may spike one or more samples with nontarget bacteria that produce a distinctly different result from the target bacterium on differential media or confirmatory tests. \u2022 State that, because of safety concerns and to prevent cross contamination, FSIS recommends that a pathogen testing laboratory be segregated from manufacturing areas and that access to the laboratory space is limited. A summary of comments and responses to the comments is included in the Federal Register notice announcing the availability of this document. 1These lists of methods that have been externally validated for the detection of foodborne pathogens are intended to be informational and are not an endorsement or approval of any particular method, regardless of its inclusion in the list.", "2 Table of Contents Chapter 1. Method Selection and Implementation page 12 E. Reporting of Results and Establishment\u2019s Interpretation of Results page 16 Chapter 3. What Data Should an Establishment Have Readily Available for FSIS Personnel page 17 References page 19 Appendix I. Laboratory Assessment Checklist page"]}]

21","3 Chapter 1. Purpose FSIS is issuing this guidance document to provide criteria to establishments producing meat, poultry and processed egg products for selecting a commercial or private microbiological testing laboratory to analyze establishment samples. FSIS recognizes that the AOAC International Guidelines for Laboratories Performing Microbiological and Chemical Analyses of Food and Pharmaceuticals is a useful technical reference for laboratory staff, and particularly as guidance for laboratories seeking to implement the ISO 17025 requirements. FSIS has included a citation for this reference in the body of this guidance document (see page 18). This FSIS document, in contrast to the Association of Analytical Communities (AOAC) document, was developed to assist industry plant managers and support staff in assessing and selecting their laboratory services at no extra charge. While FSIS acknowledges there is some technical overlap for these documents, the FSIS document provides language and content that is specific to a non-technical industry audience. A commercial laboratory refers to an outside or off-site contracting testing laboratory, while a private laboratory refers to an establishment\u2019s own in-house or on-site laboratory. Throughout this document, the term laboratory will be used to mean both types of laboratories. When outside laboratories analyze establishment samples, it is the responsibility of the regulated establishment to ensure that microbiological testing methodologies and practices meet their food safety needs. Establishments that select a laboratory that does not apply appropriate testing methods or effective Quality Control\Quality Assurance (QC\QA) practices may not receive reliable or useful testing results. FSIS-regulated establishments may perform microbiological testing (or contract with an outside laboratory) for various reasons, including, but not limited to the following: \u2022 To fulfill regulatory requirements (9 CFR 310.25, 381.94, 430.4, 590.580); \u2022 To support on-going verification of the establishment\u2019s HACCP plan (9 CFR 417.4(a)(2)); \u2022 To support decisions made in the establishment\u2019s hazard analysis ( 9 CFR 417.5(a)(1) and 417.5(a)(2)); \u2022 To evaluate the effectiveness of the establishment\u2019s sanitation program (9 CFR 416.14); or \u2022 To comply with customers\u2019 purchase specifications or requirements.","4 Ultimately, it is the responsibility of the regulated establishment to ensure that microbiological testing meets its food safety needs. Establishments should clearly communicate their needs to the testing laboratory and direct them to any necessary testing protocols or other guidance, including this document, on the FSIS Web site. It is the establishment\u2019s responsibility to understand the implication of the results from the laboratory for their program and plan corrective actions accordingly. The establishment should not assume that an unexpected result is incorrect. Resampling or retesting a sample is typically not an appropriate action. Because of safety\security concerns and to prevent cross contamination, FSIS strongly recommends that a pathogen testing laboratory be segregated from manufacturing areas, and that access to the laboratory space be limited. Pathogen testing laboratories should: \u2022 Follow requirements for Biosafety Level II laboratory operation as outlined in Biosafety in Microbiological and Biomedical Laboratories (BMBL) available at: <http://www.cdc.gov/biosafety/publications/bmbl5/BMBL.pdf>; \u2022 Restrict access to the laboratory to trained staff; and \u2022 Ensure the laboratory is operating under the supervision of a qualified microbiologist or equivalent. NOTE: Establishments can (and often do) analyze samples for non-pathogenic organisms such as Listeria spp., generic E. coli and aerobic plate counts (APC). Chapter 2. Laboratory Selection and Evaluation Criteria When evaluating the

services provided by a microbiological testing laboratory, it is important for the establishment to ensure that the candidate laboratory to be able to perform the analyses and report results using methods that meet the establishment's needs. Building a working relationship and initiating conversation consistent with these guidelines will help ensure that the establishment selects an appropriate laboratory. The evaluation criteria and recommended questions found in this document will assist establishments in making a determination that the results they receive from the laboratory are reliable and accurate. These criteria include what FSIS considers essential to understanding whether a laboratory is capable of producing acceptable results. For ease of use, a checklist of recommended questions for assessing laboratories is available in Appendix I. In addition, FSIS inspection personnel will use similar criteria to evaluate laboratory results during the verification of a food safety system such as a Hazard Analysis Critical Control Point (HACCP) system verification or a Food Safety Assessment (FSA). The criteria provided in this document include: A. Personnel qualifications;,"5 B. Sample receipt and handling, sample integrity maintenance, identity and chain of custody; C. Quality assurance management system; D. Method selection and implementation; and E. Reporting of results and establishment's interpretation of results. The selected laboratory should not subcontract any portion of the analyses to another laboratory without permission of the establishment management and proof that the subcontract laboratory meets this guidance. The establishment management should also verify that the conditions under which a sample is shipped to a subcontract or second laboratory for testing do not adversely affect the follow-up analysis. Each section of this document provides general information, questions to ask the laboratory manager, and items to be taken into consideration before selecting a laboratory. This information should be helpful for evaluating which laboratory best fits the needs of an establishment. For further assistance, additional information is available under the References listed in this document (page 18).

A. Personnel Qualifications KEY POINTS:

\u2022 The laboratory should have a policy and system in place for documenting and maintaining records on the background of laboratory management and analysts, which include their education, experience, and training, to establish analyst competency for a specific testing method.

\u2022 All laboratory personnel should be well versed in food microbiology, analytical methods of food sampling, and foodborne pathogens such as *Campylobacter*, *Salmonella*, *Listeria monocytogenes*, *E. coli* O157:H7, and non-O157 Shiga ToxinProducing *Escherichia coli* (STEC) in meat, poultry, and processed egg products. Analysts should be trained on new or revised methods before they perform the Questions to ask Laboratory Manager

1. Does the Laboratory Manager have an advanced degree (PhD or MS) or a 4-year degree in biology, chemistry, microbiology, food or medical technology, or other relevant science with at least 12 semester hours of course work in microbiology, or at least 4 years of experience working in a public health, medical, food, or other related laboratory?
2. Do the Laboratory analysts\technicians have a 4-year degree, or an associate degree in biology, microbiology, or relevant science with at least 10 semester hours of microbiology, or 2 years of working experience?
3. Does the Laboratory have records (certificates) documenting successful participation in applicable proficiency testing programs within the past year?
4. Can the Laboratory provide documentation demonstrating that all laboratory personnel meet the necessary education, training, and competency requirements?"

"6 method on establishment samples. Analysts should then demonstrate ongoing competency annually for each method performed.

Laboratories may use laboratory proficiency testing (PT) as a means to evaluate the individual analyst's initial and ongoing competencies to perform a method. Other options to demonstrate analyst competency include control charting and analyzing in-house blinded training or check samples. All relevant internal and external training should be documented for each staff member and records must show completed performance verifications.

B. Sample Receipt and Handling KEY POINTS:

- \u2022 The laboratory should have a documented system, such as a Standard Operating Procedure (SOP), for ensuring the integrity of samples during transportation and upon receipt, including discard criteria for unacceptable samples.
- \u2022 The laboratory should have a system for tracking samples after they have been received and accepted for analysis including procedures for maintaining the identity and integrity of the sample throughout storage, analysis, and reporting of test results.
- \u2022 The laboratory should have a system for tracing a test result to the correct sample.

Sample Receipt, Handling, Integrity Maintenance, Identity, and Chain of Custody General Principles:

Collecting and analyzing samples involves multiple steps, all of which must be successfully performed and documented to maintain the identity and integrity of the sample. It is important for the establishment to be able to collect and ship samples properly. On-site assistance or information on proper sample collection (aseptic techniques) and shipment of samples by the laboratory to the establishment is also important. The final result of the analysis will be neither accurate nor meaningful if a laboratory has not implemented procedures to prevent mishandling of samples or alteration of records. Procedures for maintaining sample integrity are particularly important when samples need to be transported from the establishment to an off-site laboratory (e.g., by a delivery service such as FedEx or courier) where they may not be under the direct control of the establishment or the laboratory for a period of time."

"7 Things to Look For:

1. Sample integrity: The laboratory should have procedures in place to ensure sample integrity is maintained. These procedures should include:
  - \u2022 Documenting sample custody during all stages of testing, from receipt of samples to reporting of results;
  - \u2022 Determining whether samples have been shipped and held at inappropriate temperatures, and ensuring that such samples are not analyzed;
  - \u2022 Preventing contamination from other samples or the environment.
2. Sample identity: The laboratory should have procedures to ensure that the history of any sample received by the laboratory is documented. Each sample should be labeled with permanent ink or another permanent labeling system. Each sample should be assigned a unique identifier that is associated with the sample from collection to test report.
3. Chain of custody: A chain-of-custody (COC) document is often used to demonstrate that the sample is always under the control of the establishment or the laboratory. COC documents record the circumstances under which the responsibility of the sample is transferred. They include the time, date, name, and signature of the individuals that are transferring the sample and a description of the sample, including the sample's unique identifier. The COC supports both the sample integrity and the accuracy of the test results. A Laboratory Information Management System (LIMS) is often utilized by laboratories to capture and store this COC information electronically.
4. Preparation and shipment of the sample: Non-intact samples should be placed in a sterile primary container (e.g. sterile Whirlpack bag) designated for collecting samples and shipped in a box containing cooling packs to maintain the proper temperature. Food samples in intact retail packs do not have to be placed in sterile containers but should be placed in a secondary container such as a sealed plastic bag. Shipping boxes

should be sealed to prevent unauthorized access to the sample. 5. Sample receipt: The laboratory should maintain a sample log-in book, computer file, or other permanent recordkeeping system with an accessible format to document the following: \u2022 Samples are inspected upon receipt and their condition is recorded; \u2022 Samples are evaluated against the laboratory\u2019s discard policy; and \u2022 Unacceptable samples are discarded and not analyzed.

C. Quality Assurance Management System KEY POINTS:

The laboratory should, on a regular basis (at least 2 to 3 times annually), evaluate its competency through participation in proficiency testing (PT) programs for", "8 each method performed. The laboratory should maintain PT records with sufficient information to show that the method was performed like a routine sample. For all samples, the testing laboratory should have routine controls with each batch of samples, including a positive control inoculated with the analytes of interest, a sterility control, and (optionally) a non-target analyte \u201cnegative\u201d control. The laboratory should not report results to establishments unless the controls support acceptable test performance. In addition, all laboratory equipment should be adequately maintained and routinely calibrated according to the appropriate guidance.

General Principles:

Quality assurance (QA) is defined as a program designed to ensure timely and reproducible results that are useful to customers through the minimization of human error. Quality control (QC) is defined as a procedure intended to verify that a system, such as a laboratory method, is working correctly. The International Organization for Standardization (ISO) (<http://www.iso.org/iso/home.htm>) developed internationally accepted quality standards for laboratory management, ISO\IEC (International Electrotechnical Commission) Standard 17025 General requirements for the competence of testing and calibration laboratories, focusing on QA and QC principles. Laboratories receive external audits to demonstrate compliance with the ISO standard. Although accreditation is not a specific requirement, accreditation provides increased confidence in the accuracy and quality of the test results produced by a laboratory. Note that FSIS laboratories are audited by an external assessment body to demonstrate compliance with the ISO 17025 Standard and the AOAC International Guidelines for Laboratories Performing Microbiological and Chemical Analyses of Food and Pharmaceuticals, available at: <http://www.aoac.org/accreditation/faq2.htm>. Whether or not a laboratory is accredited under ISO 17025, the Analytical Laboratory Accreditation Criteria Committee (ALACC) document is a helpful reference, available at:

[http://www.a2la.org/requirements/17025\\_FOOD\\_MICRO\\_REQ.pdf](http://www.a2la.org/requirements/17025_FOOD_MICRO_REQ.pdf). This document provides guidance on the frequency of equipment maintenance, calibration, and monitoring the performance of equipment during the course of analysis (i.e., performance verification). Alternatively, the European Co-Operation for Accreditation (EA) 04\10, Accreditation for Microbiology Laboratories provides similar guidance and is available at:

<http://www.european-accreditation.org/n1/doc/ea-4-10.pdf>. The above accreditation schemes cover all the topics mentioned in this guidance document. Laboratories that meet the guidance provided in the above mentioned accreditation schemes would meet the guidelines provided in this document. All laboratories that test samples from FSIS-regulated establishments should have QA and QC programs and should be able to describe these programs to their customers. At a minimum, QA and QC programs implemented by laboratories should cover written procedures and data collection tools, sample traceability\chain of custody, equipment maintenance and calibration, validated testing methods, PT, and analysis

controls.", "9 Things to Look For: 1. Written QA Program: The laboratory should have policy and procedure documents describing the analytical and quality activities performed in the laboratory. Analysts should only have access to the current revisions of these documents. Laboratory personnel should periodically review these QA program documents for continued suitability. 2. Proficiency testing (PT) programs: PT provides evidence of laboratory competency to produce credible analytical results in a method. PT programs are designed to critically evaluate the accuracy, precision, and efficiency of the laboratory. The laboratory should regularly evaluate their laboratory competency through a PT program. PT programs are administered by an outside organization on a routine (e.g., annual, semi-annual, or thriceannual) basis. In a PT program, the outside organization sends the laboratory a set of food samples, with each sample either inoculated or free of the microorganism of interest. The laboratory analyzes the samples and submits its results for assessment. The outside organization evaluates the returned results against the target value and provides the laboratory a report stating whether the laboratory has successfully met the criteria set by the organization administering the PT program. 3. Data collection tools: The laboratory's sample worksheets should contain sufficient information to verify the proper interpretation of the test for the final result. Worksheets should be prepared by the laboratory on a daily basis to record observations, calculations, and traceable information. These and other data collection tools should contain sufficient information to facilitate the identification of factors that may affect the accuracy of the result, such as media preparation. The worksheets should record the following (as applicable): Questions to ask Laboratory Manager 1. Does the laboratory have a written Quality Assurance Program? 2. On review and verification of laboratory PT results, were all results for the past year found to be acceptable? 3. Has the performance of the method been evaluated for use in the laboratory? 4. Are the sample type, test portion, analyte, and test method captured on the laboratory's sample worksheet? 5. Does the laboratory always run positive and sterility controls at the same time as the samples? 6. Are the laboratory results approved by the laboratory director or manager before the results are released to the customer? 7. Are the calibration, operation, and maintenance of all equipment verified to be performed in accordance with international recommendations?", "10 \u2022 Method protocol name or number; \u2022 Analysts performing the method; \u2022 Unique identifier (internal laboratory number); \u2022 Start and completion dates; \u2022 Measurements from relevant equipment such as temperature from ovens, incubators, water baths, autoclaves; \u2022 Incubation or running times; \u2022 Lane or injection order; \u2022 Equipment used; \u2022 Lot number (or traceable identification) for media, reagents, standards, and controls used in the procedure; \u2022 Sample weights; \u2022 Measurements, such as pH and water activity; \u2022 Calculations performed during the procedure; \u2022 Any other relevant observation, such as the size, color, and consistency of colonies on microbiological media; \u2022 Unexpected observations; and \u2022 Results from samples and controls. 4. Controls: The laboratory should run controls with each batch of samples, and the sample results should not be reported unless the controls indicate acceptable test performance. Controls are defined as samples that are intended to verify that the method is performed correctly and produces accurate results. Microbiological controls include: \u2022 One or more positive controls, which are food samples inoculated with a well-characterized strain that is the target of the method. The positive control result verifies that the method, all media and reagents, and the analyst are

capable of achieving the correct result at the time of analysis when the organism of interest is present. Also, laboratories use positive controls to evaluate whether the food sampled interferes with the detection of the target microorganism. Care must be taken to avoid crosscontamination between the positive control and the other samples. One way that laboratories may verify that positive sample results are not caused by cross-contamination is by using an easily identifiable positive control such as one that contains an antibiotic resistance or a fluorescence strain. \u2022 A sterility control is a type of control where prepared media are not inoculated with any control organism. Laboratories use the sterility control", "11 to verify that all media and reagents, as well as the analyst, are not contributing contamination that could have an impact on the test result. The sterility control should always be negative and there should be no evidence of microbial growth. \u2022 Additional negative controls may be helpful in some circumstances. As an example, laboratories may spike one or more samples with non-target bacteria that produce a distinctly different result from the target bacterium on differential media or confirmatory tests. Such a negative control can be inoculated at the beginning of the analysis or applied later in the analysis for specific biochemical, genetic or serological confirmation tests. NOTE: Some test kits have controls built into the test. These controls should be analyzed along with the samples and method controls to verify that the kit performs according to manufacturer specifications. Results derived from control samples can be used to identify the source of problems. Controls demonstrate the following to the customer: \u2022 The entire method is performing as expected; \u2022 The specific media and reagent lots are performing as expected; \u2022 The analyst is performing all steps of the analysis correctly; and \u2022 There is a basis for documenting that the test results are valid and accurate. Because controls are important to demonstrate that the method was effective, they should be analyzed concurrently with every batch of samples, and the results from the controls should be recorded. Importantly, an unexpected result may indicate that the method is not performing effectively; therefore, the validity of sample results should be evaluated by the laboratory. The laboratory QA system should not allow the result to be reported to the customer until the issue is resolved. In addition, the laboratory should employ controls to perform lot and batch acceptance on test kits, reagents and culture media. Sterility, selectivity and the ability to support growth of target analytes should be assessed prior to using the product on customer samples.

5. Environmental Monitoring: The laboratory should implement an effective environmental monitoring program to mitigate risk of cross contaminating sample portions. Air monitoring for density of airborne microorganisms and sponge samples of work surfaces such as bench tops, stomachers, balances, and analytical instruments, for the analytes of interest are appropriate activities. The laboratory should investigate positive results to identify cross contamination of positive samples and should follow up with necessary disinfectant of work surfaces and necessary follow up testing.", "12

6. Equipment: The laboratory should have policies and procedures in place to ensure that all equipment and software used for testing, calibration, and sampling are uniquely identified, capable of achieving the required accuracy, and comply with the method specifications. The laboratory should have procedures to ensure that equipment is used properly, maintained, and performance calibrated according to the manufacturer's recommendations, and that defective equipment is removed from the service area and clearly labeled as \u201cout of service.\u201d

D. Method Selection and Implementation KEY POINTS: Methods should be

specific or fit for the intended purpose to detect the target microorganism in the sample. Methods for detecting foodborne pathogens should be designed to be adequately sensitive to detect low levels of injured cells to prevent false negative results. The method should be capable of detecting the target pathogen, as it is defined in the corresponding FSIS Microbiology Laboratory Guidebook (MLG) protocol. Confirmation methods should be specific for target organisms, so that cross reactions with closely related microorganisms or analytes do not occur. The method should be validated using a scientifically robust study by a recognized entity, as outlined in the FSIS validation guidance document for test kit manufacturers and laboratories. Internationally recognized independent organizations, including AOAC, AFNOR (Association Fran\u00e7aise de Normalisation, the French national organization for standardization), MicroVal, and NordVal organize validation studies on behalf of clients. Any modifications introduced to a validated method should also be validated using a scientifically robust study. Sample size should be comparable to those employed by FSIS, if applicable. For more guidance from FSIS on validation studies please refer to Questions to ask Laboratory Manager 1. Does the laboratory use an analytical method described in the FSIS-MLG? 2. Has the enrichment and screening method used by the laboratory to detect the target microorganism of interest, been validated and approved by an organization such as AOAC, AFNOR, ISO, NordVal, MicroVal, FDA, FSIS, or other? If yes, specify the organization. 3. Has the method used by the laboratory to confirm the target microorganism of interest been approved by an organization such as AOAC, AFNOR, ISO, NordVal, MicroVal, FDA, FSIS, or other? If yes, specify the organization. 4. Is the sample collected representative of the production lot? 5. Is the test portion representative of the entire sample collected? If yes, is it similar to the sample size provided for in the FSIS-MLG? 6. Has the method been validated for the matrix of interest (food or environmental swabs) and the test portion size? 7. Have any changes been made by the laboratory to the validated method? If yes, request additional scientific supporting documents.", "13 \u201cFSIS Guidance for Test Kit Manufacturers, Laboratories: Evaluating the Performance of Pathogen Test Kit Methods\u201d. NOTE: Laboratories that are accredited and use the same analytical methods, procedures, and sample sizes as those used by FSIS laboratories and described in FSIS\u2019s Microbiology Laboratory Guidebook (FSIS-MLG) are deemed to have met the laboratory selection and evaluation criteria described in this chapter (Chapter 2). The FSIS-MLG is posted on the FSIS Web site at:  
<http://www.fsis.usda.gov/wps/portal/fsis/topics/science/laboratories-and-procedures/guidebooks-and-methods/microbiology-laboratory-guidebook> General Principles: All analytical methods described in the FSIS-MLG have been scientifically validated and are considered fit for their intended purpose. Thus, laboratories that analyze samples using specific instructions in the FSIS-MLG, or that have met the above evaluation criteria and are able to use the methods, would meet the evaluation criteria for laboratory selection. Validation: Laboratories may also use other validated testing methods that differ from the methods described in the FSIS-MLG. Validation as used in this document refers to a laboratory study to evaluate the performance characteristics of a testing method. Validation is typically performed by regulatory agencies or companies that develop test kits. In most cases, validation studies are designed to compare the performance of a new method (referred to as an \u201calternative\u201d method) against an older, well-characterized method (referred to as a \u201creference\u201d method). For the intended conditions of use, the performance

characteristics of the new method and the well-characterized method should be statistically indistinguishable. FSIS has also provided guidance for industry to consider when validating new microbiological methods or modifications to existing methods for foodborne pathogens. . See guidance document for more information, available at:

[http://www.fsis.usda.gov/wps/wcm/connect/966638c7-1931-471f-a79e4155ce461d65/Validation\\_Studies\\_Pathogen\\_Detection\\_Methods.pdf?MOD=AJPRES](http://www.fsis.usda.gov/wps/wcm/connect/966638c7-1931-471f-a79e4155ce461d65/Validation_Studies_Pathogen_Detection_Methods.pdf?MOD=AJPRES)

Following validated testing protocols: Establishments should verify that their laboratories follow all steps in a validated method protocol. Modifications to validated methods (whether FSIS-MLG or alternative methods) often compromise the effectiveness of the test. Verification: The laboratory should demonstrate on-going competence in performing the method at their facility, which would include participating in proficiency testing programs. In summary, establishments should determine whether a laboratory is using validated methods to test their samples, whether the methods are fit for their intended purpose, whether those methods are comparable to the methods used by FSIS (if applicable), and whether the methods have been modified from their initial validated procedure. By", "14 following these guidelines and using methods that are validated, establishments and laboratories can ensure that the results are reliable and fit for their purpose. If an establishment does not choose to use methods that have been validated, FSIS may question the support for decisions made in their hazard analysis.

Things to Look For: 1. Validated methods: The laboratory should only use validated test methods to analyze samples. Validation studies can be performed either in single or multiple laboratories. However, multiple laboratory validation studies are preferable because these studies evaluate the \u201cruggedness\u201d (comparable test performance in different laboratories with different equipment and personnel), and therefore, the likelihood that the test will have acceptable performance is greater if it has been successfully validated in multiple laboratories. 2. Fit for intended purpose: Validation by a recognized independent organization does not support that the method is appropriate for any and all situations. The laboratory and the establishment should also make a determination that the method is fit for the intended purpose. That is, the method: \u2022 Has been validated in foods or matrices representative of those likely to be sampled at the establishment; NOTE: Links to AOAC-RI Performance Tested Methods and AOAC Official Methods of Analysis are provided in the Reference section below. Manufacturers of microbiological testing products, including pathogen screening tests, often provide useful information on the validation of their products. \u2022 Has been validated to analyze the desired test portions; and \u2022 Has been validated to detect the microorganisms of concern as identified by the establishment. Additionally, laboratories and establishments should consider the following intrinsic factors: \u2022 Detection: methods intended to detect the presence of foodborne pathogens should be capable of detecting low levels (approaching one cell per test portion) of injured cells; \u2022 Raw food: the presence of fat and competitive microbiota and other factors can affect test sensitivity; \u2022 Ready- to-Eat (RTE) food: the sensitivity of methods intended for RTE food samples can be affected by properties of the product including added salt, low pH, and low water activity (in the case of dried products such as jerky); and", "15 \u2022 Environmental surface: microbial load and the presence of detergents and sanitizers typically used in RTE-producing establishments can affect method sensitivity. 3. Use of FSIS-comparable methods: If the laboratory does not use a method described in the FSIS-MLG, the analytical methods used by the laboratory should be

comparable to the methods used by FSIS. For example, for products that are tested for the foodborne pathogens E. coli O157:H7, non-O157 STECs, Salmonella, Campylobacter, or Listeria monocytogenes, the establishment should ensure that the sampling and testing methods are comparable to the appropriate FSIS methods used for these specific organisms as described in the MLG. Specifically, the methods should:

- Be validated by a recognized independent organization using an appropriate cultural method as a reference, such as the FSIS-MLG method.
- Alternatively, a validated method from a scientifically robust study using the FSIS method as a reference is acceptable but should be evaluated by FSIS. FSIS recommends submitting questions regarding the suitability of a method to askFSIS at:

<http://askfsis.custhelp.com>; and

- Be capable of analyzing a test portion similar to the FSIS test portion in terms of size and food type. The MLG provides information about the current analytical portion for each particular analysis. The test portion is the portion of the collected sample that is actually tested by the laboratory.

**4. Modifications to Validated Methods:** If the laboratory has introduced modifications to a validated analytical method, the modifications should be validated using a scientifically robust study. FSIS has encountered situations where laboratories have made significant modifications to a validated method without determining how the modification would affect test performance. Changes that should be validated include:

- Increased test portion size;
- Altered ratio of sample to enrichment broth;
- Different enrichment broth;
- Modification to established enrichment;
- Reduced enrichment time;
- Different enrichment temperature; and
- Different food sample.

If any modifications are introduced to a validated method, the method should be revalidated using a scientifically robust study and comparing it with a reference cultural method. These studies are performed by regulatory bodies or internationally recognized independent validation organizations.

**16 E. Reporting of Results and Establishment's Interpretation of Results**

**KEY POINTS:** A Certificate of Analysis (COA) or a laboratory report details data consistent with FSIS reporting results. The information provided in these reports may vary for each laboratory. FSIS recommends that establishments know what data are included in the laboratory's sample report or COA before selecting the lab.

**General Principles:** Test results should be reported in a manner consistent with the principles of quality assurance to provide useful information and to minimize human error. Laboratory reports or COAs issued for production lots should contain the following information, which is consistent with test result reports prepared by FSIS laboratories:

- Result (including the units of measurement, e.g. cfu/g, cfu/sq. in., MPN/g);
- Description of sample;
- Unique identifier of sample (internal laboratory number);
- Location of sample collection or type of product tested;
- Date of sample collection;
- Date of analysis;
- Date of result report;
- Name of method (cite AOAC, AFNOR, ISO number, if applicable);
- Name, title, and signature of individual preparing the result;
- Interpretation of results (acceptable or unacceptable); and
- Name, title, date and signature of individual reviewing result and authorizing its release.

**Things to Look For:** The laboratory's QA system should address how the combination of test results (screening vs. confirmation results) are interpreted and reported. All presumptive positive results identified by a rapid screening method should be reported. For laboratories that perform analysis of egg product samples (PEPRLab program), all presumptive positive results from official surveillance samples should also be confirmed using one of three cultural confirmed methods (AMS Laboratory Methods for

Egg", "17 Products \u2013 Section I (\u201993 rev.) and Section VII (\u201994 rev.), FSIS MLG online, Chapter 4, and FDA Bacteriological Analytical Manual (BAM) online, Chapter 5). Once analysis is started on a sample, the analysis should be completed. If the analysis is terminated before completion, the analyst should document why the analysis was not completed. The QA system should also ensure that test results that do not meet internal laboratory standards are not reported. NOTE: It is the establishment\u2019s responsibility to interpret the results for its own food safety system. Chapter 3. What Data Should an Establishment Have Readily Available for FSIS Personnel? The establishment management is responsible for testing that is conducted on its behalf and should communicate with the laboratory manager to ensure that the methods used by the laboratory are fit for purpose. The method should be validated to test the product the establishment produces. In some circumstances, such as during an outbreak investigation or FSA, FSIS will evaluate methods using similar criteria and may request additional supporting documentation from the establishment. Under the HACCP regulations, the results of any testing that is performed by an establishment that may have an impact on the establishment\u2019s hazard analysis are subject to FSIS review and are to be available to FSIS personnel. Therefore, FSIS has access to testing records and testing data related to HACCP, prerequisite programs, and good manufacturing procedures. FSIS also has access to records of testing conducted for the establishment\u2019s business customers that could bear on the hazard analysis.

Furthermore, FSIS has access to supporting documentation associated with this testing, including method protocols. Data on testing methods and results that are subject to FSIS review include, but are not limited to the following: \u2022 Testing protocol for requested analyses, including modification necessary to meet the needs of the establishment program; \u2022 Evidence of method validation; \u2022 Establishment\u2019s sampling plan, including purpose, type, and frequency of sampling; \u2022 Correspondence between the establishment and laboratory, including acknowledgement from the laboratory that it meets the criteria established in this guidance (for example, including a completed laboratory assessment checklist); \u2022 Chain of Custody (COC) documentation when samples are needed to be transported from the establishment to an off-site laboratory (e.g. by a delivery service such as FedEx or courier) where they may not be under the direct control of the establishment or the laboratory for a period of time;" "18 \u2022 Microbiological test results and reports; \u2022 Interpretation of results (acceptable\unacceptable) for use by the establishment such as applying results to determine process control or following HACCP (Hazard Critical Control Points) plan, or integrating results in conjunction with SOP; \u2022 Corrective actions related to test results, such as laboratory error, unacceptable sample temperature or failed PT; \u2022 Data and supporting documentation associated with testing; and \u2022 Testing associated with prerequisite programs and with good manufacturing procedures." <http://www.fda.gov/Food/ScienceResearch/LaboratoryMethods/BacteriologicalAnalyticalManualBAM/default.htm>, "21 APPENDIX I. Laboratory Assessment Checklist The checklist is intended to assist establishments to determine whether a microbiological laboratory is capable of producing accurate and reliable results. The questions are phrased so that the appropriate response to most questions is \u201cYes,\u201d \u201cNo,\u201d or \u201cNot applicable (\u201cNA\u201d). Questions pertaining to services or procedures not routinely used by the establishment should be marked as \u201cNA\u201d. A \u201cNo\u201d response

to any of the questions would not necessarily imply that results from the laboratory are not reliable. The establishment should request additional supporting information or a justification for the \u201cNo\u201d response, or contact FSIS through askFSIS at:

<http://askfsis.custhelp.com>, for additional assistance.

**Date Laboratory Name Questions Yes No Not Applicable (NA)**

Does the laboratory manager have an advanced degree (PhD or MS) or a 4 year degree in biology, chemistry, microbiology, food or medical technology, or other relevant science with at least 12 semester hours of course work in microbiology or at least 4 years of experience working in a public health, medical, food, or other related laboratory? Does the laboratory analyst or technician have a 4 year degree, or an associate degree in biology, microbiology, or relevant science with at least 10 semester hours of microbiology, and\or 2 years of working experience? Can the laboratory provide documentation demonstrating that all laboratory personnel meet the recommended education, training, and certification requirements above? (See Chapter 2 - A: Personnel Qualifications). Is the laboratory analyst trained on a new method and found to be competent before he\she can perform the method on the establishment samples? Does the laboratory have records (certificates) documenting the analysts\u2019 or technicians\u2019 competency, such as participation in a laboratory PT program, analyzing in-house blinded training or check samples?", "22 Does the laboratory have a written Quality Assurance Program? Is the laboratory\u2019s Quality Assurance Program periodically reviewed by an external party? Questions Yes No Not Applicable (NA)

Does the laboratory have lot acceptance criteria for test kits, reagents and growth media (i.e., does the laboratory assess them for sterility, selectivity, and ability to support growth of target analyte prior to using product on customer samples)? On review and verification of laboratory PT results, were all results for the past year found to be acceptable? For any unacceptable PT result, did the laboratory perform an appropriate root cause analysis and implement effective corrective actions? If a commercial PT program is unavailable for the target analyte, does the laboratory use blinded in-house check samples to demonstrate laboratory competency\u201d? Has the performance of the method been verified for use in the laboratory? Does the laboratory subcontract any portion of the analyses to another laboratory? If yes, does the subcontract laboratory meet the recommended criteria found in this document? If portions of the analyses are subcontracted to another laboratory, has sample integrity been maintained under the conditions under which the samples are stored and shipped? If enrichments have been shipped to a second laboratory for follow-up analysis, what ensures the integrity of these analyses? Does the sample have a unique identification number (Sample ID, internal laboratory #) to be able to trace the sample results back to sample receiving and sample collection? Does the laboratory have criteria for accepting or discarding samples when samples are received at the laboratory (sample receiving)? (for example: unbroken seals on containers; acceptable temperature for raw ground beef).", "23 Are the sample type, test portion, analyte, and test method captured on the laboratory\u2019s sample worksheet? Does the laboratory run control samples (positive, sterility, or negative) at the same time as the samples? Questions Yes No Not Applicable (NA)

Does the laboratory sample result reporting tool have the name or initial of the technician or analyst carrying out the analysis? Are the laboratory results reviewed by the laboratory director or manager before the results are released to the customer? Is equipment maintained, calibrated and performance monitored during the course of analysis (verified) in accordance with international recommendations (ALACC or EA04\10) and also maintained and

calibrated as recommended by the manufacturer? Has the enrichment or screening method used by the laboratory to detect the target microorganism of interest been approved by an organization such as AOAC, AFNOR, ISO, MicroVal, NordVal, FDA, FSIS, or other? If yes, specify the organization. Has the confirmatory method used by the laboratory to confirm the target microorganism of interest been approved by an organization such as AOAC, AFNOR, MicroVal, ISO, NordVal, FDA, FSIS, or other? If yes, specify the organization. Is the sample collected representative of the production lot? Is the test portion representative of the entire sample collected? If yes, is it similar to the sample size provided for in the FSIS-MLG? Has the method been validated for the matrix of interest (food or environmental swabs) and the test portion size? Have any changes been made by the laboratory to the validated method? If changes have been made to the validated method, does the laboratory have additional scientific supporting documentation to support the modification?", "24 Does the laboratory\u2019s sample report or COA include information on the sample type, analyte, laboratory official who approved results of test?"]}, {"file\_name": "FSIS\_GD\_2013\_0003", "title": "FSIS Compliance Guideline for Controlling Meat and Poultry Products Pending FSIS Test Results", "num": "FSIS-GD-2013-0003", "id": "1455bf810124fcde91768fb3f91af3631a0a6245ffd4616d4d4e56c42cccc254", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/media\_file/2021-09/FSIS-GD-2013-0003.pdf", "type": "pdf", "n\_pages": 17, "word\_count": 6391, "text\_by\_page": ["Guidance on the Procedures for Joint Food Safety and Inspection Service (FSIS) and Food and Drug Administration (FDA) Approval of Ingredients and Sources of Radiation Used in the Production of Meat and Poultry Products Purpose of this Document This document is intended to provide guidance to interested parties who wish to use new food ingredients and sources of radiation or to make new use of approved food ingredients and sources of radiation in the manufacture of meat and poultry products. All ingredients and sources of radiation (hereafter referred to as \"substances\") must be determined to be safe and suitable before they can be used in the production of meat and poultry products. This document explains the procedures for such a determination. Background FDA is authorized to determine the safety of substances (including Generally Recognized as Safe (GRAS) substances, food additives, and color additives), as well as prescribing safe conditions of use. However, while FDA has the responsibility for determining the safety of substances, FSIS still retains, under the tenets of the Federal Meat Inspection Act (FMIA) and the Poultry Products Inspection Act (PPIA), and their implementing regulations, the authority to determine that new substances and new uses of previously approved substances are suitable for use in meat and poultry products. Suitability relates to the effectiveness of the substance in performing the intended technical purpose of use, at the lowest level necessary, and the assurance that the conditions of use will not result in an adulterated product or one that misleads consumers. On December 23, 1999, FSIS published, in the Federal Register, a final rule, entitled \"Food Ingredients and Sources of Radiation Listed or Approved for use in the Production of Meat and Poultry Products.\" This final rule explained how FDA and FSIS will work together regarding future requests for approvals of substances to be used in or on meat and poultry products. The final rule streamlined the process for approving the use of substances in meat and poultry products by providing for the simultaneous review by FDA and FSIS of requests and petitions. A Memorandum of Understanding (MOU) was implemented in January 2000, which established a joint committee to coordinate the review of new substances and new uses of previously approved substances. The joint committee consists of representatives from both agencies, and its purpose is to facilitate the timely review of new substances and new uses of previously approved substances. The joint committee also provides a forum for communication and collaboration between FDA and FSIS on issues related to the safety and suitability of new substances and new uses of previously approved substances. The joint committee is responsible for developing and implementing procedures for the review of new substances and new uses of previously approved substances, and for ensuring that both agencies are working together to achieve the same goals. The joint committee is also responsible for resolving any disputes or disagreements between FDA and FSIS regarding the safety and suitability of new substances and new uses of previously approved substances. The joint committee is also responsible for developing and implementing procedures for the review of new substances and new uses of previously approved substances, and for ensuring that both agencies are working together to achieve the same goals. The joint committee is also responsible for resolving any disputes or disagreements between FDA and FSIS regarding the safety and suitability of new substances and new uses of previously approved substances."]]}

2000 that outlines the procedures for such reviews. The final rule and the MOU may be accessed through the FSIS Labeling and Additives Policy website at:

<http://www.fsis.usda.gov/oppde/larc>. The Labeling and Consumer Protection Staff (LCPS) serves as FSIS' focal point on the use and labeling of substances, and implements the MOU with FDA on the joint review and approval of substances. The Office of Food Additive Safety in the Center for Food Safety and Applied Nutrition (CFSAN) at FDA is responsible for regulating food ingredients and additives, as well as working collaboratively with FSIS, LCPS, in the implementation of the MOU. Ingredient\Additive Classifications and the Procedures for Approval Substances added to foods are classified and defined in FDA's regulations. The classifications include Generally Recognized as Safe (GRAS) substances, food additives (direct and secondary direct), color additives, and prior sanctioned substances. (There are also other classifications, e.g., food contact materials; however, the approval of such materials is handled on a company-by company basis by FDA.) With the exception of prior sanctioned substances, the procedures for approving ingredients and additives are described as follows:","GRAS Substances (21 CFR, Parts 182 and 184) GRAS substances generally are substances for which there is consensus among the scientific community regarding their safety, and which have a history of use in foods and are derived from foods (21 CFR 170.30). There are essentially 3 ways a substance is GRAS: (a) the substance is listed by FDA in 21 CFR Parts 182 or 184 as GRAS or Affirmed GRAS; (b) the substance is determined to be GRAS by a manufacturer, supplier, or other group (i.e., a GRAS \"self-determination\"); or (c) the substance is the subject of a GRAS notice. In order to use new substances or consider new uses of previously approved substances, FSIS must have from FDA, at the very least, a written statement of no objection with regard to the safety of the use of the substance because the mark of inspection for meat and poultry products reflects a determination by FSIS that the food product is not adulterated, and thus that all substances used to make the product are safe and suitable. FSIS must have data that show that the use of new substances is suitable for the intended technical purpose(s). (Refer to the Final Rule for a more detailed explanation of these requirements.) Therefore, with regard to (b) above, the use of substances that are self-determined by a manufacturer or supplier to be GRAS is not possible. With regard to (a) and (c) above, FDA receives GRAS notifications and requests to list substances as GRAS in 21 CFR. The criteria for which data are needed to support a GRAS classification (i.e., that show the safety of the use of an ingredient under the proposed conditions of use) are described in 21 CFR 170.30. Data are needed by FSIS to support the suitability of the use of the substance. The data need to show that the use of the substance is at the lowest level necessary to achieve the intended technical effect under the proposed conditions of use. Data must be provided for each meat and poultry product category in which use is intended (e.g., comminuted livestock products, such as cooked sausages, and cured poultry products, such as turkey ham). The use of new substances can not result in the products becoming adulterated or misbranded, e.g., making products look better or of greater value than untreated products or masking normal spoilage indicators. The Agencies operate in accordance with the MOU to evaluate the data jointly within the timeframes specified. Provided FDA agrees with the GRAS classification, they will issue a written GRAS Notice (also posted on the FDA GRAS website) which includes information regarding the notifier's responsibilities under FMIA and PPIA, and the related meat and poultry regulations. In the case of a GRAS Affirmation request, FDA will need to conduct rulemaking to amend 21 CFR. Acceptability Determinations

About the Regulatory Status of the Use of GRAS Substances

The MOU between FSIS and FDA describes a procedure whereby interested parties can request from FSIS an \"acceptability determination\" of whether the new use of substance in the production of meat and poultry products is safe and suitable. As noted previously, substances currently listed in FDA regulations for use in food generally (21 CFR, Parts 172-180) or GRAS for use in food (21 CFR, Parts 182 and 184) are not automatically acceptable for use in meat and poultry products, nor are \"self-determinations\" of GRAS possible. Unless the listing specifically mentions meat and poultry products, FSIS must have from FDA, at the very least, a written statement of no objection with regard to safety of the use of the substance. Once a written opinion is obtained from FDA, FSIS still needs to determine the suitability of the use of the substance based on data provided by the requestor that support efficacy of use. Data are needed that show the lowest level of the substance necessary to achieve the intended technical purpose. Based on the merits of the data, FSIS can permit the new use of the substance under the proposed conditions of use, and in conformance with standards and labeling requirements. Thus, not all requests for the approval of new uses of substances in the production of meat and poultry products lead to regulatory action. Rulemaking may be necessary where a standard of identity prohibits or limits the use of a substance, or the substance is not expected in the product, e.g., adding milk to hamburger.

Food Additives (21 CFR, Parts 172-180)", "Food additives (direct, secondary, indirect) are essentially chemically derived, do not have a history of use in foods, and there is no general agreement among the scientific community with regard to their safety for the use that is proposed. Direct food additives are added to food for a technical purpose and have a lasting effect in the food (e.g., the antioxidants BHA\BHT). Secondary direct additives are added for a momentary technical effect and have no lasting effect in the food (e.g., the antimicrobial agents, ozone, acidified sodium chlorite). Indirect additives have the potential to become part of a food through processing or packaging, but are not intended to be added to food for an intended technical effect (e.g., coatings and adhesives).

The approval of the use of food additives requires a great deal of scientific data in the form of petition to FDA in order to establish the safety of the substance under the proposed conditions of use, as described in 21 CFR, Part 171. Rulemaking is required on the part of FDA to amend 21 CFR. Petitions for the use of new food additives and new uses of currently approved food additives, including petitions for use in meat and poultry products, are received by FDA. FDA files such petitions publicly (i.e., in the Federal Register) if they consider them to be complete after consultation with FSIS, LCPS. Filing the petition is the start of FDA's rulemaking process. Per the MOU, FDA develops regulatory amendments in consultation with FSIS, LCPS, to amend 21 CFR. As part of the food additive petition, FSIS will require data that establish the suitability of the use of the substance for the purpose intended. The data need to show that the use of the substance is at the lowest level necessary to achieve the intended technical effect under the proposed conditions of use. Data must be provided for each meat and poultry product category in which use is intended (e.g., comminuted livestock products, such as cooked sausages, and cured poultry products, such as turkey ham). The use of new substances can not result in the products becoming adulterated or misbranded, e.g., making products look better or of greater value than untreated products or masking normal spoilage indicators. FSIS input must be provided to FDA within the timeframes specified in the MOU. All food additives must be approved for use by FDA before they may be used in meat and poultry products.

Color Additives (21 CFR, Part 70)

With regard to food applications, a color additive is any material (e.g., dye, pigment, lake) that, when added to a food, is capable of imparting a color. Although there is a different procedure for approving color additives, the procedure is similar to that of food additives, e.g., a petition to FDA is required for the approval of all new color additives which includes scientific data to support safety and suitability. When FDA receives petitions for the use of new color additives in meat and poultry products, according to the MOU, they consult with FSIS regarding efficacy and implications of the use in terms of the FMIA, PPIA, and related regulations. FDA must amend 21 CFR for the new uses of all color additives. The Agencies operate in accordance with the MOU to evaluate the data jointly within the timeframes specified. Prior Sanctioned Substances (21 CFR, Part 181) Prior sanctioned substances are excepted from the definition of \"food additive\" and are substances used in accordance with a sanction or approval granted under the Federal Food, Drug, and Cosmetic Act, Federal Meat Inspection Act, or Poultry Products Inspection Act prior to 1958. Requests for publication in 21 CFR of a prior sanction must be supported by evidence to show this. Additional Guidance Additional guidance on the procedures for the approval of substances may be obtained from the Labeling and Consumer Protection Staff at [www.fsis.usda.gov/oppde/larc](http://www.fsis.usda.gov/oppde/larc) or at (202) 205-0279.", "[Return to Related Documents]"}, {"file\_name": "FSIS\_GD\_2013\_0004", "title": "FSIS Hold and Test Conference Call with Industry", "num": "FSIS-GD-2013-0004", "id": "54580d920907777a7d376a31afae40d6e115748c21dc12ab2708e757c3d66679", "corpus": "fsis\_guidelines", "source\_page\_url": "https://www.fsis.usda.gov/policy/fsis-guidelines", "url": "https://www.fsis.usda.gov/sites/default/files/import/FAQ\_Hold\_\_Test\_020713.pdf", "type": "pdf", "n\_pages": 2, "word\_count": 783, "text\_by\_page": ["Guidance on Ingredients and Sources of Radiation Used to Reduce Microorganisms on Carcasses, Ground Beef, and Beef Trimmings Purpose This document is intended to provide guidance to interested parties who wish to use new antimicrobial agents, e.g. organic acids and acidified sodium chlorite or to make new use of antimicrobial agents that are already employed in the production of beef carcasses, ground beef, and beef trimmings, to reduce the presence of pathogenic microorganisms on meat products. This document will provide some background information on the ingredient approval process and the different classes of approved antimicrobial agents, and then provide guidance on the labeling of these substances."]}

Background All ingredients and sources of radiation must be determined to be safe and suitable before they can be used in the production of meat and poultry products. On December 23, 1999, the Food Safety and Inspection Service (FSIS) published, in the Federal Register, a final rule entitled \"Food Ingredients and Sources of Radiation Listed or Approved for Use in the Production of Meat and Poultry Products.\" This final rule explained how the Food and Drug Administration (FDA) and FSIS will work together regarding requests for approvals of ingredients and sources of radiation to be used in or on meat and poultry products. The final rule streamlined the approval process by providing for the simultaneous review by FDA and FSIS of requests and petitions. A Memorandum of Understanding (MOU) was implemented in January 2000 that outlines the procedures for such reviews. The final rule, the MOU, and a document entitled \"Guidance on the Procedures for Joint Food Safety and Inspection Service (FSIS) and Food and Drug Administration (FDA) Approval of Ingredients Used in the Production of Meat and Poultry Products,\" which describes the process for approving the use of ingredients in detail, may be accessed through the FSIS Labeling and Additives Policy website at:

[www.fsis.usda.gov\oppde\larc](http://www.fsis.usda.gov/oppde/larc). Antimicrobial Agents Some studies show that certain ingredients provide an antimicrobial effect of reducing the levels of pathogenic microorganisms, such as E. coli O157:H7, Salmonella, and Listeria. Since December 1999, FSIS and FDA have worked together to evaluate and approve or list as safe and suitable food ingredients for use in the production of meat and poultry that have an antimicrobial effect.

**Classification of Antimicrobial Agents** Antimicrobial agents can have a momentary or a lasting effect in or on the treated product and, thus, are classified by the technical effect. The technical effect will determine the approval process and the labeling. Direct Additives FSIS and FDA regulations allow various meat and poultry products, including ground beef and trimmings, to be treated with direct food additives, e.g., Lactoferrin, a Generally Recognized as Safe (GRAS) substance. Direct food additives are considered ingredients of a product and must be included in the ingredients statement on the product\u2019s labeling. Substances are considered to be ingredient if they remain in the food product and have a lasting effect on the product.

Furthermore, because, at present, the standards of identity for ground beef and trimmings are such that these are considered to be single-ingredient raw products, they are not expected by consumers to include other substances, the use of direct additives in these products must be reflected in the product\u2019s name, e.g., "Ground Beef, treated with milk-", "derived Lactoferrin." Comminuted beef products that do not have established regulatory food standards of identity may include these ingredients in their formulations without implications for product names. Secondary Direct Food Additives Acidified sodium chlorite, peroxyacids, and ozone are examples of substances that have been approved as secondary direct food additives. Secondary direct food additives provide a momentary technical effect and not a lasting effect in the treated food. These substances are ordinarily removed from the final food, and any residuals that may carry over to the final product are not expected to exhibit any technical effect. Thus, they would be considered processing aids under FDA\u2019s definition of that term in 21 CFR, 101.100(a)(3), i.e., there is no lasting functional effect, and there is an insignificant amount present in the finished product under the proposed conditions of use.

Even though FSIS has no definition of "processing aid" in its labeling regulations, the Agency, through the Labeling and Consumer Protection Staff (LCPS), which serves as FSIS\u2019 focal point on the use and labeling of food ingredients, makes judgments on a caseby-case basis using FDA\u2019s definition of a processing aid to decide whether the use of a substance is as a processing aid or as an ingredient of a food. If a substance is a processing aid, it need not be declared in the ingredients statement, nor need there be provision for its use in any standard of identity that is applicable to the finished food. The Table below reflects the currently approved substances for use in the production of meat carcasses, parts, and comminuted products for the purpose of microbial reduction.

Ingredient Name	CFR Reference	Other Reference Products for Which Application Approved
Sodium and Potassium Lactate	9 CFR 424.21 (c)	Various meat and poultry products. Direct food additive Sodium Citrate buffered with citric acid to a pH Of 5.6 Acceptability determination Non-standardized comminuted meat and poultry products. Direct food additive Sodium Diacetate
Lactoferrin	9 CFR 424.21 (c)	Various meat and poultry products. Direct food additive Lactoferrin GRAS Notice (FDA Website)
Peroxyacids	21 CFR 173.370	Beef carcasses and parts Direct food additive Peroxyacids (a mixture of peroxyacetic acid, octanoic acid, acetic acid, hydrogen peroxide, peroxyoctanoic acid, and 1hydroxyethylidene-1,1diphosphonic acid)
Acidified sodium	21 CFR 173.370	Beef carcasses Secondary direct food additive\Processing Aid Acidified sodium

chlorite 21 CFR 173.325 Carcasses, parts, and trimmings, as well as all processed, comminuted or formed meat food products. Secondary direct food additive\Processing Aid Ozone 21 CFR 173.368 All meat and poultry products Secondary direct food additive\Processing Aid Sources of ionizing radiation 21 CFR 179.26 Pork, poultry, and beef products as listed. Food additive", "The Use of Organic Acids One example of how FSIS\u2019 approach works is presented by the use of organic acids. Lactic acid, acetic acid, citric acid, ascorbic acid, and other organic acids are approved or listed in FDA regulations for various technical purposes, e.g., as acidulants, antioxidants, flavoring agents, pH adjusters, nutrients, and preservatives. There may also be other uses of these organic acids by non-meat and poultry food processors for which FDA has accepted a determination by the proponent of use of the substance that the use is GRAS. For these uses, FSIS must have from FDA, at the very least, a written statement of no objection with regard to the safety of the use of the substance. The USDA mark of inspection for meat and poultry products reflects a determination by FSIS that the food product is not adulterated, and thus that all ingredients used to make the product must be safe and suitable for the product to receive the mark. FSIS has specifically approved lactic acid, acetic acid, and citric acid as antimicrobial agents in the final wash that is applied to livestock carcasses after trimming and inspection but before chilling. The Agency\u2019s decision about this use of organic acids was based on industry requests that were supported by data that showed that this application of organic acids meets FDA\u2019s definition a processing aid (21 CFR 101.100 (a) (3)). Therefore, products made from the organic acid-treated carcasses do not have to declare the organic acids in the ingredients statement on the product label. Organic acids have also been approved for use in various meat food products for certain technical effects (e.g., as acidulants to adjust pH, flavoring agents, and color preservatives). These uses are listed in the table of approved substances in 9 CFR 424.21 (c). When organic acids are used for the purposes indicated in the table, they are considered to be ingredients of the product since they are in the finished meat food product at a detectable level, and they exhibit a continuing technical effect in or on the meat food product. Therefore, the organic acids must be declared on the label of the meat food product. If a company is interested in using one or more of these organic acids as an antimicrobial agent on beef trim (i.e., a postchill application) and does not want to declare the acid in the ingredients statement on the label of the meat food product, they must provide data to LCPS that show that the use complies with FDA\u2019s definition of a processing aid. The data must show that the acid is not having a continuing effect on the meat food product. Specifically, the supporting data must show that the fresh color of the meat is not preserved. The product will exhibit normal spoilage indicators (e.g., discoloration); and that there is no extension of shelf life as compared to products made from untreated trimmings. The data must also show that the nutrient composition is not affected by the treatment, e.g., protein is not denatured, and vitamins are not enhanced. The data must address the sensory characteristics (i.e., color and odor) of the product and show that the characteristics are not altered as compared to untreated trim. Finally, there must not be any detectable residues of the organic acid in the meat food product derived from the treated trim. Occasionally, processors request consideration of the use of ingredients without the need for labeling them on products, e.g., the treatment of meat cuts and ground beef with organic acids. To date, no data have been submitted to LCPS to show that post-chiller applications of these organic acids to carcasses, parts or trimmings are situations that are consistent with FDA\u2019s labeling definition of a

processing aid. Therefore, these substances would be considered ingredients that are direct food additives when used in this way, and their use in ground beef and trimmings derived from trimmings treated post-chiller would need to be identified on product labeling. Additional Information Additional guidance on the use and labeling of ingredients and sources of radiation for use in meat and poultry may be obtained from LCPS at [www.fsis.usda.gov/oppde/larc](http://www.fsis.usda.gov/oppde/larc) or at (202) 205-0279. guide through askFSIS or by telephone at 1-800-2333935. Introduction This is the first edition of the FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock. FSIS developed this guide to promote a systematic approach to achieve compliance with the 9 CFR Part 313 regulatory requirements for humane handling and slaughter of livestock. The guide also provides a sample humane handling plan and an assessment tool. FSIS is committed to providing establishments the best assistance possible. FSIS believes that a well-implemented systematic approach for humane handling is the best way to achieve the best practices for humane handling and slaughter of livestock. This guide describes a systematic approach that FSIS believes represents the current best practices. This guide does not include all items that could be included in an establishment's development and implementation of a systematic approach to humane handling and should not serve to limit the design of a systematic approach. The guide is simply a starting point for those establishments needing guidance and assistance in establishing a systematic approach.

**Background** In the Humane Methods of Slaughter Act (HMSA), Congress declared that humane handling and slaughter of livestock was public policy.<sup>1</sup> The HMSA states, "that the use of humane methods in the slaughter of livestock prevents needless suffering; results in safer and better working conditions for persons engaged in the slaughtering industry; brings about improvement of products and economies in slaughtering operations; and produces other benefits for producers, processors, and consumers which tend to expedite an orderly flow of livestock and livestock products in interstate and foreign commerce."<sup>2</sup> Congress amended the HMSA in 1978 to provide USDA the authority to inspect slaughterhouses for compliance with the HMSA and to penalize violators. The HMSA is referenced in the Federal Meat Inspection Act (FMIA) (21 USC 6032) and is implemented by FSIS humane handling and slaughter regulations found in 9 CFR Part 313. The FMIA provides that, for the purposes of preventing inhumane slaughter of livestock:

It is therefore declared to be the policy of the United States that the slaughtering of livestock and the handling of livestock in connection with slaughter shall be carried out only by humane methods.

21 USC 603(b) - For the purpose of preventing the inhumane slaughtering of livestock, the Secretary shall cause to be made, by inspectors appointed for that purpose, an examination and inspection of the method by which amenable species are slaughtered and handled in connection with slaughter in the slaughtering establishments inspected under this chapter. The Secretary may refuse to provide inspection to a new slaughtering establishment or may cause inspection to be temporarily suspended at a slaughtering establishment if the Secretary finds that any cattle, sheep, swine, goats, horses, mules, or other equines have been slaughtered or handled in connection with slaughter at such establishment by any method not in accordance with the Act of August 27, 1958 (72 Stat. 862; 7 USC 1901et seq.) until the establishment furnishes assurances satisfactory to the Secretary that all slaughtering and handling in connection with slaughter of livestock shall be in accordance with such a method.

**KEY INFORMATION** What is a systematic approach to humane handling? With a systematic approach, establishments focus on treating livestock in such a manner as to minimize excitement, discomfort, and accidental injury the entire time they hold livestock in connection with slaughter." "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 5 of 21 IS POULTRY SLAUGHTER INCLUDED IN THE SYSTEMATIC APPROACH? No, however, the PPIA (Poultry Products Inspection Act) and Agency regulations (9 CFR Part 381.65(b)) do require that live poultry be handled in a manner that is consistent with good

commercial practices, and that they not die from causes other than slaughter (Good Commercial Practices and the Federal Register Notice). (Note: The Federal Register Notice referenced here includes guidelines rather than regulatory requirements.) livestock, the Secretary of Agriculture will assign inspectors to examine and inspect the methods by which livestock are handled and slaughtered in connection with slaughter in establishments subject to inspection (21 USC 603(b)). Therefore, establishments are required to meet the humane handling and slaughter requirements in the regulations the entire time they hold livestock in connection with slaughter. On September 9, 2004, FSIS announced that livestock slaughter establishments should implement and maintain a systematic approach to humane handling and slaughter to best assure compliance with the HMAA, FMIA, and implementing regulations (69 Federal Register 54625). A systematic approach is a comprehensive way of evaluating how livestock enter and move through an establishment. Implementing a systematic approach is not a regulatory requirement. FSIS presents the systematic approach as the best way to ensure that establishments meet the requirements of the HMAA, FMIA, and implementing regulations. The 2004 notice outlined four recommended steps establishments should take to develop and maintain a systematic approach. When using the recommended systematic approach, establishments would take into account any new conditions in the establishment that warrant changes to facilities or existing handling or slaughter procedures. The four steps are presented in the section entitled Systematic Approach versus Robust Systematic Approach (page 6). In August 2011, FSIS issued FSIS Directive 6900.2 Humane Handling and Slaughter of Livestock \u2013 Revision 2. The directive included instructions for inspectors to determine whether livestock slaughter establishments have a robust systematic approach to humane handling. Establishments may choose to adopt a robust approach, although it is not required. For FSIS to consider a systematic approach to be robust, the Agency expects that the systematic approach will include a written animal handling program and program records. The records need to be available for FSIS review. If an establishment develops and implements a robust systematic approach to humane handling and slaughter, FSIS would consider this when determining enforcement actions following an egregious inhumane treatment event. Overview of Humane Handling and Slaughter of Livestock Humane handling and slaughter of livestock prevents needless suffering; results in safer and better working conditions within the slaughtering industry; improves products and slaughtering operations; and produces other benefits for producers, processors, and consumers. KEY DEFINITION Egregious inhumane treatment: An egregious situation is any act or condition that results in severe harm to animals (FSIS Directive 6900.2 Revision 2).", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 6 of 21 Humane handling requirements involve handling facilities and equipment, personnel practices, and slaughter equipment. Handling facilities and equipment are addressed in 9 CFR 313.1. Personnel practices are addressed in 9 CFR 313.2. Slaughter equipment is addressed in 9 CFR 313.5, 9 CFR 313.15, 9 CFR 313.16, and 9 CFR 313.30. FSIS Verification of Establishment Humane Handling Activities FSIS veterinarians and other trained Inspection Program Personnel (IPP) perform humane handling verification activities when establishments slaughter animals, or when animals are on inspected premises (FSIS Directive 6900.2 Revision 2). To verify compliance with 9 CFR Part 313, IPP make verification observations during the course of their inspection duties. FSIS records the time spent performing verification activities in the Humane Activities Tracking System (HATS). The

nine HATS categories (see text box) address all of the regulations covering the humane handling and slaughter of livestock. IPP verify specific facility, handling, or slaughter requirements for each of the categories. The table in Attachment 1 identifies each HATS category and the verification activities IPP perform. Systematic Approach versus Robust Systematic Approach A systematic approach to humane handling and slaughter takes the regulatory requirements in 9 CFR Part 313 and organizes them into a logical approach, marked by attention to detail, regular implementation, and tailoring to the operation of the establishment. Developing a systematic approach to humane handling and slaughter is the first step in ensuring that the establishment complies with the applicable humane handling and slaughter requirements. FSIS believes that the following four elements represent a systematic approach to humane handling and slaughter of livestock. Under a SYSTEMATIC APPROACH TO HUMANE HANDLING AND SLAUGHTER, establishments should 1. Assess the ability of their livestock handling and slaughter practices to minimize distress and injury to livestock. 2. Design facilities and implement handling practices that minimize distress and injury to livestock. 3. Periodically evaluate facilities and handling methods to ensure that they continue to minimize distress and injury to livestock. 4. When necessary, modify facilities and handling methods to ensure that they continue to minimize distress and injury to livestock. WHAT ARE THE HATS CATEGORIES? I. Inclement Weather II. Truck Unloading III. Water and Feed Availability IV. Ante-mortem Inspection V. Suspect and Disabled VI. Electric Prod\Alternative Object Use VII. Slips and Falls VIII. Stunning Effectiveness IX. Conscious Animals on the Rail", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 7 of 21 A robust systematic approach to humane handling and slaughter adds to the four elements by incorporating three additional features (Table 1). Those three features are: 1) WRITTEN PROCEDURES: \u2212 Describes procedures that the establishment will effectively implement to stay in compliance with the regulations. \u2212 Describes actions the establishment will take when it fails to implement the program as written or fails to prevent a noncompliance. 2) WRITTEN RECORDS: \u2212 Maintains records that demonstrate that the program is implemented as written. \u2212 Maintains records that demonstrate the program will effectively prevent identified potential noncompliances. 3) FSIS REVIEW: \u2212 Written procedures and records are both made available for FSIS review upon request. KEY INFORMATION How do I demonstrate that I have a systematic approach? The basic (non-robust) systematic approach does not include a written program or records. FSIS evaluates an establishment\u2019s systematic approach through observation of operations and discussion of humane handling with establishment personnel. The four elements of the systematic approach cover several topics. This set of questions can help determine whether the establishment has a systematic approach to humane handling and slaughter. To demonstrate working knowledge of humane handling issues, establishments should be able to discuss their approach to humane handling and slaughter by answering these questions. \u2212 What situations may result in livestock excitement, discomfort, or accidental injury? \u2212 What situations may result in stunning problems? \u2212 Is the livestock handling facility designed for the movement and holding of livestock? \u2212 Does the establishment implement the livestock handling practices as designed? \u2212 How often are livestock handling methods evaluated? \u2212 How do you evaluate the stunning methods? \u2212 How do you deal with problems with livestock handling and stunning practices? \u2212 How do you know your actions have solved or lessened the problem? \u2212 How and with what information do you

train employees?","FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 8 of 21 Table 1: Systematic Approach versus Robust Systematic Approach Assessment Design Facilities and Practices Periodic Evaluation Modification (as needed) Written Procedures Written Records FSIS Review Systematic Approach Yes Yes Yes Yes Yes No No No No Robust Systematic Approach Yes Yes Yes Yes Yes Yes FSIS believes that developing a written plan is a step toward a robust systematic approach to humane handling and slaughter because a written plan can effectively address the four aspects of a systematic approach. The Sample EST 38 Humane Handling and Slaughter Plan (attachment 3) provides basic features of a written program with records. The following table identifies the differences between the systematic approach and the robust systematic approach. FSIS Response to Egregious Inhumane Treatment When humane handling or slaughter noncompliance occurs, 9 CFR 500.2(a)(4) authorizes FSIS to take a regulatory control action, and 9 CFR 500.3(b) authorizes FSIS to suspend inspection without prior notification (Notice of Suspension). Although FSIS is authorized to suspend inspection without prior notification, FSIS may exercise enforcement discretion by providing an establishment prior notification (Notice of Intended Enforcement, 9 CFR 500.4) and an opportunity to implement necessary corrective actions to achieve humane handling compliance. FSIS Directive 6900.2 (Revision 2) instructs FSIS personnel on how to respond to egregious inhumane treatment. The action FSIS personnel will take when egregious inhumane treatment occurs is likely to vary depending on whether the following conditions exist in the establishment: a) The establishment does not have any recent humane handling related enforcement actions. b) The establishment has consistently been meeting the humane handling regulatory requirements. c) The establishment has been operating under a written animal handling program that is a robust systematic approach and the establishment has made the written program accessible to IPP. d) The establishment has demonstrated the robustness of the program to IPP by effectively and consistently implementing all aspects of its program. In establishments without a robust systematic approach to humane handling and slaughter, or when not all of the conditions (a. through d.) provided above exist, FSIS instructs IPP to take the following action:","FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 9 of 21 \u2022 In the case of humane handling or slaughter noncompliance with egregious inhumane treatment, the inspector in charge recommends issuance of a Notice of Suspension. In establishments maintaining a robust systematic approach to humane handling and slaughter, and when the conditions (a. through d.) provided above exist, FSIS instructs inspection program personnel to take the following action. \u2022 In the case of humane handling or slaughter noncompliance with egregious inhumane treatment \u2013 the inspector in charge recommends issuance of a Notice of Intended Enforcement rather than a Notice of Suspension. NOTE: 9 CFR Part 500 \u2013 Rules of Practice defines suspension as \u201can interruption in the assignment of program employees to all or part of an establishment,\u201d and 9 CFR Part 500.3 (b) gives FSIS the authority to impose a suspension without providing establishments prior notification for handling or slaughtering animals inhumanely; that is, the stunning and slaughter of livestock stops while under a suspension. FSIS may \u201cimpose a suspension after an establishment is provided prior notification and the opportunity to demonstrate or achieve compliance\u201d (9 CFR Part 500.4). FSIS acts on this authority by issuing a Notice of Intended Enforcement. Establishment\u2019s in receipt of a Notice of Intended Enforcement are afforded time (up to 3 days) to demonstrate or achieve compliance.

If the establishment does not demonstrate or achieve compliance in 3 days, FSIS issues a Notice of Suspension.", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 10 of 21 Creating a Robust Systematic Humane Handling and Slaughter Plan Step 1: Conduct an assessment FSIS believes that an assessment is the best first step toward a robust systematic approach to humane handling and slaughter. FSIS considers an assessment robust if it takes into consideration the establishment\u2019s entire humane handling and slaughter infrastructure. An assessment of humane handling and slaughter determines whether any component of the establishment\u2019s infrastructure has the potential to result in inhumane handling or slaughter of livestock. The Code of Federal Regulations (9 CFR Part 313) describes three general categories of infrastructure, 1) livestock facilities, 2) personnel practices, and 3) slaughter equipment. \u2212 Livestock facilities include the following components. \u2212 Vehicles and trailers used to transport livestock. \u2212 Facilities and equipment through which livestock pass as they move from transport vehicles or trailers to holding facilities, between holding facilities, and from holding facilities to restraining devices. \u2212 Facilities used to hold livestock temporarily. \u2212 Facilities and equipment used to restrict livestock movement during slaughter. \u2212 Personnel practices address the knowledge, skills, and abilities of any person handling livestock on the official premise. \u2212 Slaughter equipment includes the equipment used to render livestock insensible to pain and induce death. The Humane Methods of Slaughter Act describes two methods of slaughter found to be humane. \u2212 Render insensible to pain by a single blow<sup>3</sup> or gunshot<sup>4</sup> or by electrical stunning,<sup>5</sup> chemical exposure<sup>6</sup> or other means<sup>7</sup>. \u2212 Slaughter in accordance with the ritual requirements of a religious faith. To facilitate an assessment, FSIS is providing a sample assessment tool for humane handling and slaughter in Attachment 2 of this document. The tool contains all humane handling requirements as statements. The assessor decides if each statement is true, false, or does not apply to the establishment. The assessor should check \u201cTrue\u201d if the item does not have the potential to result in inhumane handling or slaughter of livestock. The assessor should check \u201cFalse\u201d if the item has the potential to result in inhumane handling or slaughter of livestock. 3 9 CFR 313.15 describes the approved use of captive bolts 4 9 CFR 313.16 describes the approved use of gunshot 5 9 CFR 313.30 describes the approved use of electrical stunning 6 9 CFR 313.5 describes the approved use of carbon dioxide gas 7 9 CFR 313 does not allow other methods of humane slaughter; however, 9 CFR 303.1(h) authorizes FSIS to permit experimentation with new technologies. Compliance assistance with new technologies is available at New Technologies.", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 11 of 21 Step 2: Create a written plan FSIS believes that developing a written plan is the best second step toward a robust systematic approach to humane handling and slaughter because a written plan can effectively address the four aspects of a systematic approach. Without access to the written plan, FSIS will not be able to verify effective implementation of a program that the establishment believes reflects a robust systematic approach. Establishments address each item checked \u201cFalse\u201d in step one in a written plan. FSIS considers a written plan robust if it addresses each component of handling and slaughter at the establishment that could result in inhumane handling or inhumane slaughter of livestock. Establishments may consider the following elements important when developing a written plan (Attachment 3) for humane handling and slaughter: \u2212 A list of establishment humane handling and slaughter equipment and facilities

identified as having the potential to result in inhumane handling or slaughter of livestock. (Attachment 2) \u2022 A list of procedures and monitoring frequencies sufficient to maintain humane handling and slaughter process control and prevent inhumane handling or slaughter. (Attachment 4) \u2022 A list of standards for maintaining facilities. (Attachment 2) \u2022 A list of corrective actions that address noncompliances and process control. \u2022 Provides for routine verification of implementation of the plan and reassessment and update of the plan.

Step 3: Create a recordkeeping system FSIS believes that developing a recordkeeping system (Attachment 4) is the best third step toward a robust systematic approach to humane handling and slaughter. FSIS considers a recordkeeping system robust if it promotes accuracy and provides for accountability. Establishments may consider the following elements important features of a record keeping system:

- \u2022 Documents all monitoring, corrective action, verification, and reassessment activities.
- \u2022 Prevents unauthorized access, destruction, alteration, or removal of records.
- \u2022 Provides ready access and information sharing.

"FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 12 of 21 Attachment 1: HATS Categories and FSIS verification Activities Category FSIS Verification Regulations I. Inclement Weather Verify how the establishment adapts its facilities and holding practices to inclement weather to ensure the humane handling of animals. 9 CFR 313.1 and 313.2 II. Truck Unloading Verify that the establishment\u2019s livestock handling facilities are in proper repair during livestock unloading activities. 9 CFR 313.1 and 313.2 III. Water and Feed Availability Verify the accessibility of water and feed to livestock. 9 CFR 313.2 IV. Ante-mortem Inspection Verify the establishment\u2019s procedures for humanely handling livestock during ante-mortem inspection of livestock. 9 CFR 313.1 and 313.2 V. Suspect and Disabled Verify that the establishment handles US Suspect and disabled livestock humanely. 9 CFR 313.1 and 313.2 VI. Electric Prod, Alternative Object Use Verify that the establishment humanely and effectively moves livestock without excessive prodding or the use of sharp objects. 9 CFR 313.2 VII. Slips and Falls Verify that the establishment prevents livestock from slipping and falling due to inadequate footing or improper handling practices. 9 CFR 313.1 and 313.2 VIII. Stunning Effectiveness Verify the establishment\u2019s procedures to appropriately and effectively administer stunning methods that are rapid and effective and that produce unconsciousness in the animals before the animal is shackled, hoisted, thrown, cast, or stuck. 9 CFR 313.5, 313.15, 313.16, and 313.30 IX. Conscious Animals on the Rail Verify, after stunning, that livestock remain unconscious before and after they are shackled, hoisted, thrown, cast, or stuck. 9 CFR 313.5, 313.15, 313.16, and 313.30", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 13 of 21 Attachment 2: Sample Assessment Tool for Humane Handling and Slaughter The sample assessment tool is a starting point. Not all of the parameters listed will apply to all establishments. Some establishments may have additional parameters. Sample Assessment Tool for Humane Handling and Slaughter Check \u201cTrue\u201d if the item does not have the potential to result in inhumane handling and/or slaughter of livestock Check \u201cFalse\u201d if the item has the potential to result in inhumane handling and/or slaughter of livestock Check \u201cN/A\u201d if the item does not apply to the establishment

FACILITIES True False N/A TRANSPORTATION OF LIVESTOCK: TRANSPORT VEHICLES Transport vehicles are free from protruding objects. Transport vehicles are free from sharp metal of any kind. Transport vehicles are free from loose boards. Transport vehicles are free from splintered planking. Transport vehicles are free from broken planking.

Transport vehicles are free from openings that can trap livestock's head. Transport vehicles are free from openings that can trap livestock's feet. Transport vehicles are free from openings that can trap livestock's legs. Transport vehicles provide good footing.

FACILITY RAMPS Ramps<sup>8</sup> are in good repair. Ramps are free from protruding objects. Ramps are free from sharp metal of any kind. Ramps are free from loose boards. Ramps are free from splintered planking. Ramps are free from broken planking. Ramps are free from openings that can trap livestock's head. Ramps are free from openings that can trap livestock's feet. Ramps are free from openings that can trap livestock's legs. Ramps provide good footing. Ramps arranged to minimize sharp corners. Ramps arranged to minimize direction reversal of driven animals.

FACILITY DRIVEWAYS Driveways<sup>9</sup> are in good repair. Driveways are free from protruding objects. Driveways are free from sharp metal of any kind. Driveways are free from loose boards. Driveways are free from splintered planking. Driveways are free from broken planking. Driveways are free from openings that can trap livestock's head.

Driveways are free from openings that can trap livestock's feet. Driveways are free from openings that can trap livestock's legs. Driveways provide good footing. Driveways arranged to minimize sharp corners. Driveways arranged to minimize direction reversal of driven animals.

<sup>8</sup> The term "cramp" in 9 CFR 313, describes any facility used to transfer livestock from transport vehicles to ground level. Ramps can be fixed structures or mobile equipment.

<sup>9</sup> The terms "driveway," "alley," and "pathway" in 9 CFR 313 are synonymous. They describe a facility used to move livestock from transport vehicles to holding pens, between holding pens, and from holding pens to restraining devices. The livestock industry routinely uses other terms to describe these facilities.

"FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 14 of 21

FACILITY HOLDING PENS Holding pens<sup>10</sup> are in good repair. Holding pens are free from protruding objects. Holding pens are free from sharp metal of any kind. Holding pens are free from loose boards. Holding pens are free from splintered planking.

Holding pens are free from broken planking. Holding pens are free from openings that can trap livestock's head. Holding pens are free from openings that can trap livestock's feet. Holding pens are free from openings that can trap livestock's legs. Holding pens provide good footing. Holding pens arranged to minimize sharp corners. Holding pens arranged to minimize direction reversal of driven animals.

Covered holding pens provided for US Suspects.

FACILITY GATES Gates<sup>11</sup> are in good repair. Gates are free from protruding objects. Gates are free from sharp metal of any kind. Gates are free from loose boards. Gates are free from splintered planking. Gates are free from broken planking. Gates are free from unnecessary openings that can trap livestock's head. Gates are free from unnecessary openings that can trap livestock's feet. Gates are free from unnecessary openings that can trap livestock's legs.

FACILITY RESTRAINING DEVICES Restraining devices<sup>12</sup> are in good repair. Restraining devices are free from sharp objects. Restraining devices are free from protruding sharp metal of any kind. Restraining devices are free from protruding objects. Restraining devices are free from exposed bolt ends. Restraining devices are free from loose boards.

Restraining devices are free from splintered planking. Restraining devices are free from broken planking. Restraining devices are free from exposed wheels. Restraining devices are free from exposed gears. Restraining devices are free from openings that can trap livestock's head. Restraining devices are free from openings that can trap livestock's feet.

devices are free from openings that can trap livestock's legs. Restraining devices comfortably accommodate the livestock restrained. OTHER DEVICES Use of Video or Other Electronic Monitoring or Recording Equipment 10 The term "holding pen" describes a facility used to hold livestock temporarily. Livestock enter and exit holding pens from driveways. 11 The term "gates" means devices designed to mechanically move or drive livestock, and devices designed to keep livestock in motion or compartmentalized. "Gates" describe devices used to limit the movement of one or more livestock. Gates can be manual or mechanical. They can move horizontally, vertically, or pivot on a central axis. The livestock industry routinely uses other terms to describe these devices. 12 The terms "restraining device," "restraining mechanism," "cchute," "cstunning area," and "ccompartments" in 9 CFR 313 are synonymous. They describe a facility used to restrict livestock movement during stunning. The livestock industry routinely uses other terms to describe these facilities." "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 15 of 21 Personnel Practices True False N/A Personnel minimize excitement of livestock during movement. Personnel minimize excitement of livestock when using electric prods. Personnel minimize excitement of livestock when using canvas slappers. Personnel minimize excitement of livestock when using other equipment. Personnel minimize excitement when using stunning equipment. Personnel are trained and the training is documented and reviewed periodically. Personnel minimize discomfort of livestock during movement. Personnel minimize discomfort of livestock when using electric prods. Personnel minimize discomfort of livestock when using canvas slappers. Personnel minimize discomfort of livestock when using other equipment. Personnel minimize discomfort when using stunning equipment. Personnel prevent injury of livestock during movement. Personnel prevent injury of livestock when using electric prods. Personnel prevent injury of livestock when using canvas slappers. Personnel prevent injury of livestock when using other equipment. Personnel prevent injury when using stunning equipment. Personnel move livestock at a normal walking speed. Personnel provide livestock in holding pens with access to water. Personnel provide livestock held longer than 24 hours with access to feed. Personnel provide livestock held overnight with sufficient room to lie down. Personnel separate non-ambulatory disabled livestock from normal animals. Personnel set electrical prods to lowest effective voltage, not to exceed 50 V AC. Personnel do not drag conscious livestock. Personnel do not use pipes to drive livestock. Personnel do not use sharp objects to drive livestock. Personnel do not use pointed objects to drive livestock. Personnel are knowledgeable and effective in humane handling methods. Personnel are knowledgeable and effective in humane slaughter methods. Personnel transporting livestock comply with 28 Hour Rule. Stunning (General) True False N/A Livestock restraint allows the stunner operator to stun accurately. Stunning equipment designed for livestock slaughtered. Single application of stunning method renders livestock insensible to pain<sup>13</sup>. Livestock are insensible to pain immediately after stunning method applied. Livestock are unconscious and insensible to pain before shackling. Livestock are unconscious and insensible to pain before hoisting. Livestock are unconscious and insensible to pain before throwing. Livestock are unconscious and insensible to pain before casting. Livestock are unconscious and insensible to pain before cutting. Livestock remain unconscious and insensible to pain throughout shackling. Livestock remain unconscious and insensible to pain throughout hoisting. Livestock remain unconscious and

insensible to pain throughout throwing. Livestock remain unconscious and insensible to pain throughout casting. 13 The term \u201cinsensible to pain\u201d is synonymous with surgical anesthesia and unconsciousness.", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 16 of 21 Livestock remain unconscious and insensible to pain throughout cutting. Livestock remain unconscious and insensible to pain throughout bleeding. Stunning equipment operator is skilled. Stunning equipment operator is attentive. Stunning equipment operator is aware of their responsibility. Stunning equipment operator is trained. Stunning equipment operator is experienced. Stunning (Carbon Dioxide) True False N\A Carbon dioxide does not induce death in calves and sheep. Only sheep, calves and swine are slaughtered with carbon dioxide. All carbon dioxide delivery devices are in good repair. Concentration of carbon dioxide gas delivered is uniform. Rate of carbon dioxide gas delivery is sufficient. Rate of carbon dioxide gas delivery is uniform. Mixing of carbon dioxide gas and air within the chamber is adequate. Carbon dioxide gas delivered is free from noxious or irritating gases. Atmospheric air delivered is free from noxious or irritating gases. All carbon dioxide monitoring devices are in good repair. Sampling of carbon dioxide gas within the chamber is continuous. Samples of carbon dioxide gas collected are representative from within the chamber. Monitoring of carbon dioxide gas concentration within the chamber is continuous. Recordings of carbon dioxide gas concentration are graphical. Monitoring of carbon dioxide gas exposure time within the chamber is continuous. Recordings of carbon dioxide gas exposure time are graphical. All carbon dioxide delivery and recording devices are available for inspection by FSIS. An exhaust system prevents non-uniform carbon dioxide concentrations in chamber. An exhaust system prevents carbon dioxide contamination of the ambient air. Stunning (Captive Bolt) True False N\A Captive bolt stunners that inject compressed air into the cranium not used to stun cattle. Captive bolt stunning equipment is in good repair. Compressed air delivered at constant pressure. Air pressure monitoring devices are accurate. Air pressure monitoring devices operate constantly. Air pressure monitoring devices are easy to read. Air pressure gauges are conveniently located. Captive bolt stunning equipment equipped with safety features. Operator accurately directs the captive bolt to produce immediate unconsciousness. Operator selects appropriate captive bolt stunner for size of livestock. Stunning (Gunshot) True False N\A Firearms maintained in good repair. Operator uses hollow pointed or frangible iron plastic composition bullets; powdered iron missiles Operator accurately directs the bullet to produce immediate unconsciousness. Operator selects appropriate caliber bullet for size of livestock. Stunning (Electrical) True False N\A Suitable timing, voltage and current control devices are used. Electrical stunning equipment is in good repair. Duration, voltage, and current monitoring devices are accurate.", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 17 of 21 Duration, voltage, and current monitoring devices are easy to read. Duration, voltage, and current monitoring devices are conveniently located. Duration, voltage, and current monitoring devices are available for FSIS inspection. Operator selects appropriate electrical stunner settings for size of livestock. Operator accurately places the electrical stunner to produce immediate unconsciousness. Ritual Slaughter True False N\A Ritual slaughter performed by the religious authority (or duly-appointed designee) Ritual slaughter performed in accordance with standard set by the religious authority. No additional dressing cuts are made until livestock are insensible to pain.", "FSIS Compliance Guide for a Systematic Approach to the Humane Handling of

Livestock Page 18 of 21 Does this example address FSIS\u2019 basic expectations for the written part of a Robust Systematic Humane Handling plan? Yes, this example is a good place to start the development of a plan. You may find over time the basic approach expands to include additional safeguards you put in place. You can access FSIS assistance using this sample through askFSIS or by telephone at 1-800-233-3935.

Attachment 3: Sample EST 38 Humane Handling and Slaughter Plan Description of our business: We are a small, family-owned business producing specialty pork products. We typically slaughter one day per week. We raise all of the pigs we slaughter on our near-by family farm and transport them to the official establishment on the day of slaughter in a family-owned livestock trailer. We hold no live swine at the official establishment longer than 10-12 hours. The rear gate of the livestock trailer doubles as the off-loading ramp. We slaughter only healthy swine and sell all unhealthy swine to a local livestock dealer.

Animal Handling Plan: Live pigs off-load from the livestock trailer directly into one of two open-air holding pens. The pens connect by a gate to a common covered alleyway that leads to the restrainer. All holding pen and alleyway floors are waffled and sloped to facilitate drainage. Holding pens have water troughs. Interior and exterior fence construction is comprised of commercial hog fence panels and gates fastened to metal posts set in concrete. We herd swine with polyethylene sorting panels purchased locally. The restrainer is a manual device. We use electrical stunning to produce cardiac arrest. We have a back-up hand-held captive bolt in case the electrical stunning equipment become inoperable. We purchased the restraining and stunning devices through a local supplier. We operate the electrical stunner and captive bolt according to the operator\u2019s manuals that came with the equipment. Each stunned pig is shackled, hoisted, cut, and bled before we slaughter the next pig.

Assessment\Reassessment: We based our initial assessment on the tool (attachment 2) in the FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock. We will reassess our plan as needed based on our monitoring results. We will document any reassessment, and summarize all changes to our plan and records, on the back of our monitoring record.

Procedures, monitoring frequencies, and target values: We will list our procedures, monitoring frequencies, and objectives on the monitoring record.

Documentation: We will record monitoring results on our monitoring record. We will create a record for each day we slaughter pigs.

\u201cWhenever the response to a monitoring question is \u201cnono\u201d or at other times when a humane handling problem is identified, we will take immediate action to resolve it and document that action on the back of the monitoring record.

Responses will follow these principles:

- 1.) If an animal is severely injured or in distress, we will immediately humanely euthanize;
- 2.) We will immediately halt or modify our operations when necessary to ensure all animals are handled humanely and not subject",

"FSIS Compliance Guide for a Systematic Approach to the Humane Handling of Livestock Page 19 of 21 to injury or distress;

- 3.) We will make any necessary repairs to facilities at the earliest possible opportunity.

Within 30 days, one of the owners will review the monitoring record, verify any corrective actions, review any reassessment, and record the date verified on the monitoring record. We will maintain all completed monitoring records in the owner\u2019s office for one year and then we will destroy them. We will make monitoring records available to FSIS in a timely manner.",

3","I. Purpose may be used at slaughter establishments to prevent, eliminate, or reduce levels of Salmonella on hogs. This guidance also references scientific studies that indicate lairage is a significant factor in the spread of Salmonella. FSIS encourages further study and solutions by industry in controlling and reducing the spread of Salmonella in hog slaughter facilities. This guidance targets hog establishments and discusses recommended best practices that would help them better comply with the relevant regulatory requirements (9 CFR 310.7, 310.10, 310.11, 310.12, 310.18, 310.25, Part 416, and Part 417). This guidance document includes suggestions for establishments to improve their slaughter management practices to address Salmonella. When an establishment makes changes at the appropriate processing locations, process control should result in raw pork products that have less contamination with pathogens including Salmonella. This guidance document also describes steps involved in the hog slaughter process and production of raw products. Each slaughter step section targets best practice recommendations for Salmonella contamination control. The document includes information on farm The purpose of this guidance document is to provide information on best practices that This guidance provides information on best practices that may be used at slaughter to prevent, eliminate, or reduce levels of Salmonella in market hogs. rearing and transport that establishments may share with their suppliers or producers that provide market hogs to them. The guideline also includes supplemental information for controlling parasitic hazards; *Trichinella spiralis*; and *Toxoplasma gondii* (Attachment 1). The reference list at the end of the document provides resource material. Key Points: \uf0b7 This guidance references scientific studies that indicate lairage is a significant factor in the spread of Salmonella. 4","II. Introduction Establishments should slaughter and process market hogs in a manner designed to prevent or reduce contamination from occurring at every step of the processes (shown in fig. 1) and should use decontamination and antimicrobial intervention treatments as necessary to address any contamination that: (a) may result from the implementation of the slaughter process or (b) otherwise occurs on the carcasses. Key Points: \uf0b7 Maintain adequate sanitation in pens \uf0b7 Maintain adequate sanitary separation between each carcass, and between parts and viscera during dressing \uf0b7 Routinely clean and sanitize equipment and hand tools that are used to prepare for presentation prior to opening, and remove contamination after cutting into the carcass \uf0b7 Design and arrange equipment to prevent the contact of successive carcasses and carcass parts with contaminated equipment \uf0b7 Frequently wash hands and aprons that come in contact with carcasses \uf0b7 Implement decontamination and antimicrobial intervention treatments 5","vacuuming Figure 1. Public

Health Relevance Nontyphoidal Salmonella is the most common cause of bacterial food borne illness, accounting for 11% of food borne illnesses (about 1 million illnesses), 35% of hospitalizations and 28% of deaths. Campylobacter accounts for approximately 9% of food borne illnesses (about 845,000 illnesses) and 15% of hospitalizations (Scallan et al., 2011a). Swine can harbor both pathogens, though at varying levels (Zhao et al., 2001, 2010). Outbreaks resulting in human Salmonella illnesses involving pork have been consistently identified on an annual basis, Outbreaks resulting in human Salmonella illnesses involving pork have been consistently identified on an annual basis, suggesting pork as a vehicle for salmonellosis. suggesting pork as a vehicle for salmonellosis. Between 2000 and 2007, approximately four outbreaks and one hundred and two illnesses per year, on average, have been associated with pork. These estimates were calculated for outbreaks where pork was sole implicated food vehicle or identified as the sole contaminated ingredient. A yearly comparison shows from 2000 to 2007 there were five, seven, three, three, four, three, three and seven outbreaks, respectively. Among the eight years of data, 2007 had the most salmonellosis cases associated with pork consumption at 236 illnesses. For additional information please visit the Centers for Disease Control and Preventions (CDC) foodborne illness outbreak website at: <http://www.cdc.gov/foodborneoutbreaks/>. Four Campylobacter outbreaks were associated with pork (CDC, 1998 to 2008). During the Market Hog Baseline shake down period, Campylobacter was not detected. Subsequently, Campylobacter was not sampled for during the Nationwide Market Hogs Microbiological Baseline Survey baseline testing 2010 to 2011. Under the 1996 Pathogen Reduction\Hazard Analysis and Critical Control Point (PR\HACCP) final rule, FSIS established Salmonella performance standards for several raw product classes, including market hogs, as a means of verifying that establishments control food safety hazards in fresh meat processing. FSIS verifies the performance standards by conducting the Salmonella verification testing program, in which FSIS samples and analyzes sets of chilled carcasses for Salmonella. Results from Salmonella verification sets for CY 1998 to 2010 may be found at the following link:

[http://www.fsis.usda.gov/Science/Progress\\_Report\\_Salmonella\\_Testing\\_tables/index.asp](http://www.fsis.usda.gov/Science/Progress_Report_Salmonella_Testing_tables/index.asp). In 2006, FSIS announced several new policies in the Federal Register Notice (FRN), Salmonella Verification Sample Result Reporting: Agency Policy and Use in Public Health Protection (71 FR 9772) intended to strengthen the Salmonella Verification Program including: 7," \uf0b7 Develop a more risk-based algorithm as a means to more frequently schedule sampling in the higher risk establishments. \uf0b7 Report each individual Salmonella result to each establishment as soon as it becomes available. \uf0b7 Post quarterly nationwide Salmonella data showing aggregate results of sample set results by product class. See Quarterly Salmonella Results. \uf0b7 Conduct Food Safety Assessments (FSAs) in establishments failing its Salmonella standards, or showing poor process control. \uf0b7 Provide serotype data on verification set results as soon as results are available. \uf0b7 Work more closely with other federal and state public health agencies to develop sub-typing policies. \uf0b7 Conduct additional Nationwide Microbiological Baselines to develop tightened performance standards for Salmonella (and Campylobacter if applicable). In July, 2011 FSIS implemented updated Salmonella performance standards and new Campylobacter performance standards for young chickens and turkeys. These standards were developed from Nationwide Microbiological Baselines. With these new lower standards in poultry; market hogs now have the highest permissible standard (8.7

percent) for Salmonella of all raw carcass product classes. For an establishment to meet this standard there can be no more than six Salmonella positives in the 55 analyzed samples (referred to as a \u201cset\u201d). FSIS conducted the Nationwide Microbiological Baseline Data Collection Program; Market Hog Survey, from August 2010 to August 2011. FSIS has completed two previous nationwide surveys in market hogs. The first FSIS nationwide market hog microbiological baseline data collection was in April 1995 to March 1996 and the second FSIS nationwide pork microbiological baseline data collection was in June 1997 to May 1998. FSIS designed and performed this most recent survey to estimate the percent positive and levels of microbiological pathogens and indicator bacteria on market hog carcasses. During the survey, FSIS collected sponge samples at pre-evisceration and post-chill from two separate shifts from the belly, ham, and jowl portion of market hogs slaughtered in Federal establishments. FSIS collected a total of 3,920 sponge samples (1,960 at pre-evisceration and 1,960 at post-chill) at 152 establishments. Only market hogs were eligible for testing in the survey. Boar or stag swine, feral swine, roaster swine, and sows were excluded from this survey. Through the survey, FSIS gathered data concerning the percent positives and quantitative levels of selected foodborne pathogens, and microorganisms as indicators of process control (e.g., Salmonella, generic Escherichia coli, Enterobacteriaceae, coliforms, and aerobic plate counts). Additional information regarding The Nationwide Microbiological Baseline Data 8", "Collection Program: Market Hog Survey August 2010 to August 2011 may be found at the following link: [http://www.fsis.usda.gov/wps/wcm/connect/d5c7c1d6-09b5-4dcc-93aef3e67ff045bb/Baseline\\_Data\\_Market\\_Hogs\\_2010-2011.pdf?MOD=AJPERES](http://www.fsis.usda.gov/wps/wcm/connect/d5c7c1d6-09b5-4dcc-93aef3e67ff045bb/Baseline_Data_Market_Hogs_2010-2011.pdf?MOD=AJPERES). These data collected and discussed in this document, and best practices described throughout this document will enable the Agency to work more effectively with industry to reduce the risk of foodborne pathogens in FSIS regulated products.

IV. Cross Contamination Main routes for cross contamination:

- \uf0b7 Airborne bacteria
- \uf0b7 Contamination of walls or floors by splashing of contaminated fluid
- \uf0b7 Contact with dirty surfaces (through equipment, hands, clothes)

All controls in slaughter and dressing procedures should be aimed at eliminating contamination. Slaughter establishments can reduce prevalence of pathogens by conducting operations in a manner that reduces contamination. Establishments can eliminate or reduce contamination through adequate separation of carcasses, parts, and viscera during dressing, routine cleaning and disinfection of equipment and hand tools as described in 9 CFR 416.3. In addition, establishments should use appropriate equipment and arrange equipment to prevent cross contamination of carcasses and parts. They should use equipment designed so that it can be adequately cleaned and sanitized daily. Finally, they should ensure functional lavatories are appropriately located, with hand washing and disinfection units strategically placed on the slaughter floor as described Key Point: in 9 CFR 416.2 (h). The first and paramount rule Cross-contamination occurs when pathogens are of sanitary dressing is to carried throughout the plant and adhere to carcasses avoid any contamination of and meat contact surfaces. Bolton (2002) showed that edible portions of the carcass there can be airborne bacterial contamination at levels with materials such as feces, up to  $3.5 \log_{10} \text{CFU}/\text{m}^3$  within the slaughter urine, hair, ingesta, milk, bile, establishment. McDermid and Lever (1996) showed pathological tissues or that Salmonella can survive in aerosols at  $75.2 \mu\text{m}$  (24\u00b0C) exudates, or other filth. and 75% humidity for periods exceeding 24 hours. These positive correlations with the environment suggests that contaminated air may be a source of carcass

contamination. 9", "Scalding and singeing can greatly reduce bacteria on the skin of the hog; however, the skin is often recontaminated when the carcass passes through dehairing and polishing equipment (Yu, 1999). Polishing carcasses contaminated with feces may make this contamination invisible, allowing it to go undetected during subsequent visual inspections.

Recommended Best Practices: Cross Contamination Prevention \uf0b7 Minimize airborne contamination through effective ventilation and control of air flow \uf0b7 Sanitize equipment and enforce employee hand washing to prevent contamination during processing \uf0b7 Separate from the processing areas the facilities for hand washing, access to toilet facilities, and areas where clothes and footwear are changed \uf0b7 Use walls and other separating structures, between \u201cdirty\u201d and \u201cclean\u201d processes and maximize spatial separation of activities to reduce crosscontamination

V. Farm Rearing Control of Salmonella begins on the farm. A review of Danish pork production has shown that Salmonella prevalence in the herd is a significant factor for determining the Salmonella prevalence and levels on carcasses (Alban and Stark, 2005). Limiting the commingling of piglets in the nursery from various sources, as well as rodent control, at the rearing farm has shown a decrease the incidence of Salmonella (Goldbach, 2005). Salmonella infection in hogs may not be obvious because hogs can be asymptomatic carriers (Schwartz, 1999). There is an association between Salmonella positive hogs and contaminated carcasses at the end of the slaughter line (Vieira-Pinto, 2006). One study found that carcass contamination was mainly influenced by the probability that at least one hog contributing to the pool was seropositive (Baptista, et al 2010). This finding suggests the Salmonella carcass contamination came from the incoming hogs, and that Salmonella control on the farm is desirable. Other studies have shown a correlation between increased levels of Salmonella in hogs and the use of pelleted food (Davies, et al 1997).

10", "Recommended Best Practices: Farm Rearing \uf0b7 Control rodents \uf0b7 Control co-mingling of hogs and reduce human contact \uf0b7 Use nonpelleted feed \uf0b7 Practice good sanitation, biosecurity, and dead control \uf0b7 Vaccinate herd for Salmonella where applicable

VI. Transport Stress during transport and slaughter is known to influence the physiological and biochemical processes in hogs (Benjamin, 2005). Stress is thought to affect the bacterial ecology of the gastrointestinal tract and the immunity of the animal, resulting in increased Salmonella enterica shedding (Hurd, 2003). Rapid infection after exposure to Salmonella during transport (e.g., when trailers are not cleaned between loads from different sources) is a major reason for increased Salmonella enterica prevalence in hogs (Hurd, 2002). Hurd et al. (2005) reported increased serovar diversity of isolates obtained after slaughter compared to that of isolates from pen mates necropsied on the farm. This increase in diversity suggests that hogs may be exposed to new S. enterica sources after leaving the farm.

Recommended Best Practices: Transport \uf0b7 Clean transfer trailers after each use \uf0b7 Do not mix hog herds during transportation (Boes, 2001)

11", "VII. Lairage A study of hog slaughter processing concluded that the lairage is the most cost-effective stage to prevent cross-contamination that leads to rapid infection (Vander Gaag, 2004). Prolonged transportation and holding in the lairage may induce Salmonella shedding by infected hogs (Alban, 2005). Several Hurd studies offer insight into the preharvest ecology of Salmonella during lairage. These studies suggested the following: \uf0b7 Hogs become internally contaminated with Salmonella after leaving the farm (Hurd, et al 2001) \uf0b7 Surface contamination of the holding pen

Key Point: Lairage is the most cost-effective stage to prevent cross contamination. reflects the

quality of in-plant practices and may not be a useful measure of pre-harvest prevalence (Hurd, et al 2001) There is rapid infection during holding, suggesting the holding pen as an important *S.enterica* control point in the preharvest pork production chain (Hurd et. al. 2003). In addition to the frequent contamination of holding pens, 33.3% of hog drinking water samples were contaminated with *Salmonella*. This finding indicates that more attention to the microbiological quality of water is needed and that the water may be contaminated from the environment (Hurd, 2003) Key Point: It is important to remember that lairage is a critical processing step in hog slaughter that should not be overlooked. Implementation of recommended best practices can minimize or eliminate the spread of *Salmonella* at subsequent processing steps. 12", "Recommended Best Practices: Lairage Minimize the time the hogs are held in lairage (Hurd, 2001) Prevent overcrowding during time in lairage (Hurd, 2001a,b) Keep water in lairage pens fresh and change after each herd (Rostagno, 2003) Use slatted or elevated floors in lairage pens to reduce waste and water accumulation Maintain lairage pens in order to prevent conditions that could injure animals Avoid mixing of herds (Borch, 1996; Alban, 2005) Disinfect lairage pens and alley ways, between herds, using chlorinated alkaline detergent followed by disinfection with a quaternary ammonium solution (Dehalle, 2008) Ensure that hogs are washed clean (pen shower) and dry enough to preclude dripping at the time of stunning Segregate *Salmonella* positive herds and process them at the end the production day ( Alban, 2005;Boes, 2001) VIII. Stunning Carbon dioxide (CO<sub>2</sub>) and the electro narcosis stunning methods have no effect on carcass microbiology (Dehalle, 2008). Appropriate stunning methods are required for an establishment to be in compliance with the Humane Methods of Slaughter Act (HMSA). 13", "IX. Slaughter\Bleeding The bleeding process results in a significant accumulation of body fluids, feces, and dirt on walls and floor of the area and is a significant source of cross contamination for *Salmonella* (Bolton, 2002). A study showed that stick knives have tested positive for *Salmonella* and may be a source of cross-contamination (Botteldoorn, 2003), suggesting that sanitation of knives is critical. Efficiency and control of knife use is important to prevent wounds that are too deep. Deep wounds may penetrate the oropharynx or may allow introduction of scald water and pathogens including *Salmonella*, into the pleural cavity. Key Point: The bleeding process is a significant source of crosscontamination for *Salmonella*. X. Scalding Vertical scalding using steam may improve the bacteriological quality of the meat, prevent bacterial contamination of lungs, and reduce muscular degeneration and development of pale, soft, exudative muscle (PSE) because the internal temperature of the meat does not exceed 5 °F (41 °C) (Gracey, 1992). Vertical steam scalding reduces operating costs if the cooling water from the condenser in the steam tunnel is used to flush the carcasses during the de-hairing process. Scalding may be used as a critical control point (CCP) in a HACCP system (Bolton, 2002; Hald, 1999) if the temperature of the scalding water\steam and the duration is adequate. The cleanliness of the hogs and the status of the scald water were factors significantly associated with *Salmonella* on the carcasses at the end of the slaughter process (Letellier, 2009). Key Point: Scalding may be used as a critical control point in a HACCP system if the temperature of the scald water or steam and duration of scald are adequate. 14", "Recommended Best Practices: Scalding Evacuate feces from the rectum or implement an anus bunging system (coning) Wash the evacuated carcass before scalding Scalding water should be 145 °F (62°C) for 5 minutes

Maintain sanitary conditions. Ensure that the scalding tank is easy to clean and in good condition and repair. Drain and clean the scalding tank daily. Pay particular attention to weld sites and rough, scratched areas in the interior of the tank to ensure proper cleaning. Remove or prevent accumulations of hair and protein from the scalding tank and dehairing machine both before and during operations. Control condensation as needed to maintain sanitary conditions.

Recirculation of water may affect accumulation of hair and residue and control temperature fluctuations. Maintain a clean supply of water. Change the scald water frequently to prevent organic load build up. Recommended Best Practices: Scalding Use a counter current application (fresh or recirculated scald water that flows into the scalding tank in an opposite direction from that of the carcasses) to increase heating efficiency and water cleanliness. The stick wound should be promptly trimmed, and preferably immediately after scalding. The trimmings should be discarded. A vertical steam scald at 212 °F (100 °C) allows for a constant supply of clean steam and prevents the organic load which would accumulate if a water system was used. Add an anti-foaming agent to the scald water to reduce organic load build up in foam. XI. De-hairing Care is needed when using a de-hairing machine in order to prevent recontamination and increases in bacterial load (Morgan, 1987; Gill and Jones, 1995; Gill and Bryant, 1993; Davies, 1999; Yu, 1999; FRPERC 2007). Salmonella has been detected in air samples at the locations of de-hairing and evisceration operations (Pearce, 2005). Recommended Best Practices: De-hairing Clean and disinfect de-hairing equipment, preferably using a clean-in-place (CIP) system which may be applied on an ongoing basis throughout production. At the end of the production day, remove all organic material and debris from de-hairing equipment by power hosing with water at a pressure of 290 to 435 psi. A layer of alkaline detergent should then be applied to the equipment for 15-20 minutes in order to remove any organic material prior to sanitation of the equipment using a quaternary ammonia or similar disinfectant (Bolton, 2002). Use water between 140 °F to 144 °F (60 to 62 °C) in the de-hairing machine if the water is not chemically treated (7 ICMSF, 1998). If possible, prior to de-hairing evaluate methods to prevent fecal voiding (Bolton, 2002). Have in place procedures to clean contaminated carcasses that void fecal material after de-hairing and prior to gambrelling and rehanging. Pasteurize hog carcasses using hot water sheets at 185 °F (85 °C) or higher for 20 seconds after de-hairing. This has been shown to reduce contamination (Bolton, 2002; McMullen, 2000). For hand shaving, use an extremely sharp knife. Prevent cutting through the skin in order to reduce introducing bacteria into the interior of the carcass. XII. Gambrelling Recommended Best Practices: Gambrelling Assure carcasses are not recontaminated on the gambrel table by hogs that evacuate bowels post de-hairing. XIII. Steam/Hot Water Vacuuming The decontamination of pork carcasses by steam and lactic acid reduced the surface microbial counts immediately after treatment and retarded microbial growth during storage. Such treatment can be used to prolong the shelf-life and to increase the safety of pork carcasses. (Pipek et al. 2006) Recommended Best Practices: Steam/Hot Water Vacuuming Assure carcasses are not recontaminated on the gambrel table by hogs that evacuate bowels post de-hairing. Monitor equipment temperature, pressure, and nozzle (Pipek et al, 2006). Vacuum carcasses from top to bottom using 90-95 °F (35 °C) steam ( Pipek,et al 2006). Clean the equipment frequently on a regular preventative maintenance schedule. Apply steam vacuuming to carcasses after de-

hairing, singeing, or polishing \uf0b7 Use a 2% lactic acid solution at 131\u00b0F (55\u00b0C) for more than 60 seconds, 13-23psi (VanNetten et al.1995 17","XIV. Singeing Singeing has been identified as a significant step for reducing microbial contamination on the surface of hog carcasses, including Salmonella (James, 2007; Bolton, 2002; Pearce, 2004; Alban and Stark, 2005). Various studies have shown that singeing achieves a 2.5-3.0 log<sub>10</sub> CFU/cm<sup>2</sup> reduction in total microbial load (Bolton, 2002; Pearce, 2004) and a reduction of Salmonella incidence from 7% to 0% (Pearce, 2004). A study by Dehalle showed that a single singeing process can decrease the APC (aerobic plate count) 2.2 to 2.5 log<sub>10</sub> CFU/cm<sup>2</sup>. Key Point: Singeing has been identified as a significant step for reducing microbial contamination on the surfaces of hog carcasses, including Salmonella. Recommended Best Practices: Singeing \uf0b7 Use a full (multiple heat sources) singe process \uf0b7 Ensure that the surface carcass temperature reaches 212 \u00b0 F (100 \u00b0 C) 18","XV. Polishing Polishing is a primary mode of pork carcass recontamination following reductions that were achieved during singeing (James, 2007; Bolton, 2002; Snijders, 1984; Gill, 1995; Hald, 1999). Any surviving bacteria are mechanically disseminated by stainless steel scrapers or nylon brushes used in polishing (Delhalle, 2008). Polishers must be cleaned thoroughly because they harbor and allow bacteria to multiply to high levels (Borsch, 1996; Huis in\u2019t Veld, 1992). Key Point: Polishing is a primary mode of pork carcass recontamination following reductions that were achieved during singeing.

Recommended Best Practices: Polishing \uf0b7 Use high pressure water jets instead of flail or whip wet polisher \uf0b7 Thoroughly and frequently clean the polishing equipment \uf0b7 If singeing is efficient, the polishing process may be replaced with a pressurized, 185 \u00b0 F (85 \u00b0 C) or higher hot water wash, improving carcass decontamination rather than possible recontamination during polishing. (Gill, 1995, 1998; Van Netten, 1995; Spescha, 2006) \uf0b7 Add an additional singeing step, after polishing, to reduce contamination introduced by polishing (Spescha, 2006, Dehalle, 2008); Consider whether carcasses have been adequately reconditioned in a sanitary manner, if contaminated by feces voided during the gambrelling step 19","XVI. Knife Trimming Before treating carcasses with a pre-evisceration rinse or spray, a measure should be in place to prevent visibly contaminated carcasses from being sprayed or rinsed. If steam or hot water vacuuming is not available, knife trimming can be used to remove fecal contamination and other dressing defects. Knife trimming reduces the volume of contamination that might otherwise be diluted by washing after singeing. XVII. Pre-evisceration Carcass Rinse or Spray A listing of suitable compounds that can be used for pre-evisceration rinsing or spraying is detailed in FSIS Directive 7120.1. Additional information regarding antimicrobial compounds can be found at the following web sites:

<http://foodsafety.psu.edu/movies/carcass.html>

<http://foodsafety.psu.edu/movies/intervention%20booklet%202005.pdf>. Pre-evisceration Rinse or Spray \uf0b7 Use water at a temperature greater than 160 \u00b0 F (71.1 \u00b0 C) \uf0b7 Trim open abscesses, septic bruises, parasites, and parasitic lesions before the carcass enters the cabinet \uf0b7 If pressure is used to spray, do not exceed 100 psi to prevent driving contamination into the tissue \uf0b7 Monitor concentrations and temperatures regularly to verify effectiveness \uf0b7 Minimize overspray of water or solution from the cabinet \uf0b7 Larger operations should consider using stainless steel cabinets with an arbor of spray nozzles 20","Pre-evisceration Rinse or Spray \uf0b7 Apply organic acids with a hand spray applicator assuring the carcass is totally covered \uf0b7 Consider using a post-evisceration rinse or spray

to further reduce carcass contamination \uf0b7 Verify that the cabinet is used in a manner that prevents cross contamination of adjacent carcasse; Carcasses should not be touching prior to final inspection XVIII. Head Washing\Head Dropping Recommended Best Practices: Head Washing\ Head Dropping \uf0b7 Flush the oral cavity removing ingesta, bile, or other contaminants before head dropping and head inspection \uf0b7 Sanitize knives and head dropping equipment between carcasses and whenever sectioning of the gullet occurs \uf0b7 Be aware of potential contamination of the head, neck, and carcass by knives or equipment after incision of the oral-pharyngeal cavity or from exposure to fresh stomach contents when dropping heads and processing of head and cheek meat 21", "XIX. Bung Isolation Recommended Best Practices: Bung Isolation \uf0b7 Tie bung, cut free from surrounding tissues with a single incision, and cover area with a protective covering \uf0b7 During separation prevent contact of bung with carcass or with viscera. Secure bag with tie or clip \uf0b7 Ensure employee hygiene and use of personal protective equipment (gloves and aprons) (McEvoy, 2003b, Edwards and Fund, 2006) \uf0b7 Immediately remove any contamination that results from bunging \uf0b7 If possible, use an automated bunging system called \u201cbung guns\u201d instead of manual bung tying. An automated bunging system will reduce cross-contamination, by going around the anus and evacuating the rectum (Sheridan, 1998) \uf0b7 Sanitize bung guns, knives, and hooks between each carcass \uf0b7 Prevent contaminated water from dripping down the back of the carcass 22", "XX. Evisceration Recommended Best Practices: Evisceration \uf0b7 Remove all hair, scurf, and dirt from the hooves and the carcass and thoroughly wash the carcass before evisceration (9 CFR 310.11) \uf0b7 Sanitary dressing guidelines for beef may be applied to swine \uf0b7 To prevent contamination of the carcass or viscera, tie the rectum before evisceration. Remove the pluck with gullet and viscera attached (so there is no leakage) \uf0b7 Only skilled, experienced individuals should perform the evisceration; Experienced individuals are needed at higher line speeds \uf0b7 Avoid cutting or rupturing the gut. The critical operations are: cutting around the rectum, removal of the intestinal tract, and removal of the pluck system (Alban and Stark, 2005) \uf0b7 Take care to avoid cross-contamination, which may occur when carcass splitting saw blades come in contact with the spinal column or throat (Dehalle, 2008) \uf0b7 Remove carcasses with visual contamination or bruising for reconditioning (knife trimming or steam vacuuming) before carcass splitting \uf0b7 Disinfect carcass splitting equipment after each use (9 CFR 416.3, 416.4). 23", "XXI. Pre-chill Final Rinse\Hot Rinse\Steam Pasteurization Recommended Best Practices: Pre-chill Final Rinse\Hot Rinse\Steam Pasteurization \uf0b7 When a contaminated carcass is not adequately cleaned before the final wash, the carcass should be diverted to a holding rail until cleaned \uf0b7 Clean the contaminated carcasses by removing visible contamination by trimming or steam or hot-water vacuuming prior to final inspection and final washing \uf0b7 Rinse carcasses from the top down \uf0b7 Minimize any splash onto other carcasses \uf0b7 When utilizing a thermal pasteurization system, deliver water or steam to the entire surface of the carcass at a temperature of at least 165 \u00b0 F (73.9 \u00b0 C). \uf0b7 Pressure should not be high enough to drive contamination into the tissue \uf0b7 Small operations may use cold water to wash carcasses; Improve decontamination by adding chemicals such as chlorine or trisodium phosphate (Bolton 2002) \uf0b7 A pressurized diluted 2 to 3% lactic acid or acetic acid is recommended (McMullen, 2000). Consider careful treatment of necks and inside jowls when the head is separated from the carcass \uf0b7 Monitor drains to ensure they are working

properly and prevent backup that may result in carcass and equipment contamination 24", "XXII. Spray Chilling Recommended Best Practices: Spray Chilling \uf0b7 Spray chill carcasses using an organic spray 2 days prior to fabrication to maximize reduction of Salmonella (Algino, 2009) \uf0b7 Maintain the cooler at a temperature that ensures carcasses will have an internal temperature of 40 °F (4.4 °C) 24 hours after being put in the cooler XXIII. Carcass Fabrication Recommended Best Practices: Carcass Fabrication \uf0b7 Apply organic acid antimicrobial treatment \uf0b7 Maintain boning and fabrication rooms at 50 °F (10 °C) or less \uf0b7 Maintain fabrication area and equipment in a sanitary condition 25", "XXIV. Packaging\Finished Product Storage and Transport Recommended Best Practices: Packaging\Finished Product Storage and Transport \uf0b7 Storage room and transportation vehicle temperature should be maintained at 40 °F (4.4 °C) or less \uf0b7 Maintain Internal meat temperature during storage at 40 °F (4.4 °C) or less \uf0b7 Monitor and document temperature of storage room, vehicle, and meat XXV. Validation Validation is the process of demonstrating that the HACCP system as designed can adequately control identified hazards to produce a safe, unadulterated product. Examples of some controls that would require validation are CCPs, pre-requisite program interventions preventing a hazard from being likely to occur, and product formulations when the formulation contributes to the safety of the product. There has been much confusion about which HACCP activities are on-going verification and which are initial validation. This confusion has been magnified by the fact that the NACMCF definition of the HACCP principle verification includes validation. Many agree that validation should be a distinct function from verification (Scott and Stevenson, 2006). Key Point: There are two distinct elements to validation: 1. The scientific or technical support for the HACCP system design and; 2. The initial practical in plant demonstration proving the HACCP system can perform as expected (execution) 26", "90 calendar days of initial validation takes place upon completion of the hazard analysis and development of the HACCP system. This period provides an opportunity to check the validity or adequacy of the HACCP system. Establishments are to conduct validation activities during their initial experience with a new HACCP system. Establishments are required to complete the initial validation of the new HACCP plan in accordance with 9 CFR 417.4 during a period not to exceed 90 calendar days after the date the new process is used to produce product for distribution in commerce. During these 90 calendar days, an establishment gathers data from its monitoring and on-going verification activities at an increased frequency than listed in the HACCP plan and gathers additional data to demonstrate that the process is being executed effectively. During this period an establishment should be reviewing these data and making modifications to its system as necessary. Many agree that validation should be a distinct function from verification Following the 90 calendar day period of initial validation, an establishment uses its findings during the initial validation period to fully implement its system and solidify its monitoring and on-going verification procedures and frequencies. The establishment then continues on a daily basis to perform monitoring and verification activities to ensure that the HACCP plan continues to be implemented properly. Ongoing verification activities include but are not limited to: the calibration of processmonitoring instruments; direct observation of monitoring activities and corrective actions; and the review of records generated and maintained in accordance with 417.5(a)(3). During the annual reassessment, FSIS recommends that establishments review specific food safety related records generated during ongoing verification that demonstrate

that their HACCP systems are adequate (i.e., test results and monitoring of critical operational parameters). Additional information on validation can be found in the FSIS Compliance

Guideline for HACCP Systems Validation at:

[http://www.fsis.usda.gov/wps/wcm/connect/a6a16ac5-93e0-46dc-986a557930d2209f/HACCP\\_Systems\\_Validation\\_Draft\\_Guidance\\_0412.pdf?MOD=AJPERE](http://www.fsis.usda.gov/wps/wcm/connect/a6a16ac5-93e0-46dc-986a557930d2209f/HACCP_Systems_Validation_Draft_Guidance_0412.pdf?MOD=AJPERE)

XXVI. Process Control Verification Process control is a procedure or set of procedures designed to provide control of the establishment's operating conditions that are necessary for the production of safe and wholesome food. The goal of process control in a slaughter establishment is to minimize microbial contamination of the carcasses, to reduce bacterial pathogens that may be present and injurious to health, to control the proliferation of any remaining micro-organisms, and to prevent recontamination. 27", "Process control procedures are likely to include decontamination of carcasses, adequate sanitary dressing practices, antimicrobial intervention treatments, and implementation of best practices described throughout this compliance guide. Establishments that fail to control these procedures and treatments create the potential for contamination of carcasses and products. Establishments can verify the effectiveness of their process control procedures by conducting: \uf0b7 process mapping and; Key Points: \uf0b7 conducting on-going verification activities, such as microbiological sampling and testing utilizing indicator organisms. \uf0b7 Process mapping entails conducting microbial sampling at selected points in the process where contamination levels can be assessed. Process mapping is a useful challenge study tool. Process mapping entails conducting microbial sampling at selected points in the process where contamination levels can be assessed. The assessment measures microbiological loads on carcasses against a specific target organism or class of organisms. Process mapping provides a baseline for assessing the effectiveness of certain interventions as well as the effectiveness of the overall food safety system. Process mapping shows areas where immediate improvements can be made or where there is a need for process adjustments. A process mapping (testing) protocol could include procedures for obtaining multiple samples after each processing step or slaughter period (shift). Plotting these test results can then be used as a map of the microbial reduction at each intervention step in the system. \uf0b7 Process mapping shows areas where immediate improvements can be made or where there is a need for process adjustments.

XXVII. Process Control Verification Using Indicator Organisms As Performance Criteria Microbiological sampling programs within establishments can include testing for indicator organisms. Indicator organisms are analyzed to predict the distribution, number, and response of specific pathogenic organisms on a particular product as it travels through a HACCP system. 28", "Testing for indicator organisms is less costly than testing for pathogenic bacteria. Also, indicator organisms are easier to detect and quantify. Testing for indicator organisms is a valuable tool to monitor actual in-plant processes and determine whether a process is in control. Establishments may choose from a variety of indicator organisms to measure microbial contamination and determine process control. Examples of indicator organisms that may be suitable measures of fecal contamination include aerobic plate count (APC), Enterobacteriaceae, Total coliforms, and Generic Key Points: E. coli. Advantages of using If an establishment does not have its own indicator indicator organisms: organism data, it can use the process control limits developed from the FSIS Nationwide Market Hogs \uf0b7 Less costly Microbiological Baseline Survey (MHBS) testing results (2010-2011) to help achieve this goal, \uf0b7 Easier to detect and

provide information that is easier to detect and quantify, and facilitate daily verification activities. During the MHBS, FSIS collected samples from two points during processing: pre-evisceration and monitor in plant post-chill. Pre-evisceration refers to the location early in the process prior to evisceration of the processes hog. Post-chill refers to a later point in the process after carcasses are chilled; all interventions completed, and before the hog carcasses enter coolers. The information in Table 1 below was derived from the FSIS Nationwide Market Hog Microbiological Baseline Survey (MHBS) for specific indicator organism limits that correspond to the 80th percentile. FSIS compared the presence and levels of specific microbiological targets to determine whether significant differences existed between samples taken at pre-evisceration and post-chill. Percentiles represent the percent of establishments that are below the associated number in the distribution of average bacteria indicators per plant. An establishment may use the indicator organism limits in the Table 1 to verify that the establishment is exercising process control. For example, the table demonstrates that if an establishment has APC levels above 790 CFU/cm<sup>2</sup> at post chill, its process is most likely out of control, and the establishment should immediately take corrective action to bring its process back under control. A prudent establishment should aim for results below those limits listed for each indicator organism at pre-evisceration and post chill locations. Indicator organism results below control limits shown in Table 1 indicate that the process is in control. For example, APC levels below 790 CFU/cm<sup>2</sup> demonstrates effective process control. FSIS recommends that the establishment plot data over time to determine whether its overall processes are in control and to determine the variability in its food safety system. 29", "The establishment should take appropriate actions if it determines that its process is not in control.

Table 1: Indicator Organism Criteria Limits for Market Hogs Indicator Organism APCs

Enterobacteriaceae Total Coliforms	E. coli Average CFU/cm <sup>2</sup>	Preevisceration	Postchill
110	5,500	35	3,800
110	5,500	35	3,800
30	30	30	30
Distribution	Percentile	80%	80%
Preevisceration	Postchill	80%	80%
Preevisceration	Postchill	80%	80%
Postchill	4200000	790	8,300

Given that samples collected per establishment in the MHBS were limited, and the variation within individual establishments was high, the control limits in the table are approximations. Testing for indicator organisms is a valuable tool for assessing consistent process control within an establishment and is less costly than testing for Salmonella. Moreover, indicator organisms are generally easier to quantify than Salmonella. Nonetheless, a prudent establishment would adopt a testing program that includes both indicator organisms and testing for the pathogen Salmonella at an established frequency as part of its on-going in plant verification program. The indicator organisms would provide ongoing evidence of control, while periodic testing for the pathogen Salmonella would verify that the process is successfully addressing the pathogen. Establishments may use their own sampling data if there is adequate statistical rigor to establish statistical process controls action levels. Many small and very small establishments may not have resources for a program that provides for a sampling frequency to determine statistical process control action levels. Therefore, an establishment can also use the estimated national prevalence of 1.66% for Salmonella calculated from MHBS to assess establishment Salmonella sampling results to determine whether their processes are in control. If aggregated test results over time for an establishment are above the national prevalence estimate of 1.66%, it raises questions about the adequacy of process control within that establishment. Additional information on the national prevalence estimate can be found in the baseline report at:

[http://www.fsis.usda.gov/wps/wcm/connect/d5c7c1d6-09b5-4dcc-93aef3e67ff045bb/Baseline\\_Data\\_Market\\_Hogs\\_2010-2011.pdf?MOD=AJPERES](http://www.fsis.usda.gov/wps/wcm/connect/d5c7c1d6-09b5-4dcc-93aef3e67ff045bb/Baseline_Data_Market_Hogs_2010-2011.pdf?MOD=AJPERES). The indicator organisms would provide ongoing evidence of control, while periodic testing for Salmonella would verify that the process is successfully addressing Salmonella.

30", "XXVIII. New Technologies FSIS recognizes that new technologies provide opportunities to improve and strengthen cost effective process controls. The Agency strongly recommends that all establishments be aware of new techniques, chemicals, and machinery that may be utilized to improve their ability to produce wholesome products. FSIS has reviewed submitted protocols and listed these new technologies on the FSIS Web site. For detailed information on particular technology, interested parties should contact the listed new technology provider or manufacturer's web site. This list is at:

[http://www.fsis.usda.gov/Regulations/New\\_Technology\\_Table\\_Feb\\_06/index.asp](http://www.fsis.usda.gov/Regulations/New_Technology_Table_Feb_06/index.asp). In addition, FSIS has funded Cooperative Agreement studies. From studies completed in Key Point: New technologies provide opportunities to improve and strengthen cost effective process controls. 2003, FSIS identified technologies that may reduce levels of Salmonella. These technologies may be cost-effective for small and very small plants. A list of these completed studies on new technology can be found at:

[http://www.fsis.usda.gov/regulations\\_&\\_policies/Technologies\\_Applicable\\_for\\_Small\\_Very\\_Small\\_Plants\\_FY2003/index.asp](http://www.fsis.usda.gov/regulations_&_policies/Technologies_Applicable_for_Small_Very_Small_Plants_FY2003/index.asp).

XXIX. Information from Food Safety Assessments (FSAs)

An FSA is a comprehensive evaluation of an establishment's food safety system that assesses the establishment's sanitation controls, compliance with microbiological performance criteria, adequacy of slaughter house and processing plant Hazard Analysis and Critical Control Point (HACCP) systems, the design and operation of its prerequisite programs (including sanitary dressing procedures), and its response to food safety control deviations. In 2009, FSIS began prioritizing the scheduling of FSAs based on public health decision criteria, in addition to traditional event-based scheduling. FSIS Directive 5100.4 Prioritized Scheduling of Food Safety Assessments (FSAs) Using the Public Health Information System (PHIS), provides the decision criteria that FSIS uses to schedule FSAs.

31", "An establishment that meets one or more of the decision criteria under any of the priority levels provided in Table 1 of FSIS Directive 5100.4 will receive a for cause FSA. A for cause FSA is one that is prompted by a positive sample result, production and shipment of adulterated product, or any other high priority food safety related incident. An establishment's failure to meet the Salmonella Performance standard is one of the public health decision criteria that will result in a for cause FSA. Since 2009, there has been one FSA conducted by FSIS in response to an establishment's failure to meet the Salmonella Performance Standards for market hogs. FSIS completed a Salmonella set for market hogs at this establishment on March 25, 2010, and found 7 positives in the sample set (one over the limit of 6). This finding resulted in a for cause FSA being conducted at the establishment. In response to the FSA findings, the establishment implemented the following corrective actions:

\uf0b7 Increased lactic acid concentration from 2 to 5% to a consistent 4.5 % level sprayed on carcasses just prior to entering the cooler

\uf0b7 Targeted Inspexx (antimicrobial) at 200 ppm (instead of 100 \u2013 200ppm)

\uf0b7 Retrained employees in GMPs

\uf0b7 Reviewed carcass chilling procedures and sanitary carcass dressing procedures

\uf0b7 Placed hog carcass coolers on a regular cleaning schedule

\uf0b7 Collected knives used on the kill floor at the end of the

shift and implemented cleaning by a contract sanitation company. The establishment completed its second sample set on July 23, 2010, and passed with 4 positives in the set. XXX. Conclusion Microbial contamination in the slaughter house environment can start with the delivery of Salmonella positive hogs. However, there is significant scientific evidence that a large number of hogs are exposed to Salmonella during lariage. Such awareness of potentially significant areas of contamination can serve as reinforcement to reduce Salmonella during harvest. Studies have also shown that improved pre-harvest sanitation can reduce the levels of Salmonella exposure. Sanitary maintenance of slaughter house equipment, good slaughtering practices, and effective washing and disinfection of equipment and materials at critical steps are critical to reducing Salmonella contamination. If sanitary conditions are not maintained throughout slaughter and processing, the major reductions in microbial load noted at some stages of the process can be offset by cross-contamination or recontamination at subsequent stages of the process. Decreasing the level of Salmonella during slaughter and processing can decrease the number of human cases of salmonellosis from pork consumption by 75% (Miller, 2005). 32", "FSIS recommends that intervention and control strategies be formulated based on a combination of measures that are both practical and economically feasible. A multifactorial infection such as Salmonella requires a multi-level approach of intervention and control.

Appropriate modifications of establishment operations based on information provided in this guidance should reduce the levels of Salmonella in slaughter steps. Attachment 1 Supplemental Information Controlling Parasitic Hazards in Market Hogs: (Trichinella spiralis and Toxoplasma gondii) Trichinella spiralis (T. spiralis) and Toxoplasma gondii (T. gondii) are parasites that infect both humans and warm-blooded animals. Trichina is a generic term that refers to Trichinella, and the disease caused by this parasite is referred to as trichinellosis. Humans can become infected with T. spiralis by consuming encysted larvae in the muscle tissue of an infected animal. A common source of trichinellosis in humans is the consumption of undercooked pork. Pigs are the primary host for T. spiralis (Hill et al., 2012). Felids (cat family) are the primary host for T. gondii, and they can contaminate the environment by excreting the oocyst in their feces (Jone et al., 2012). Domestic food animals, Trichinella spiralis (T. spiralis) and Toxoplasma gondii (T. gondii) are including pigs, can be infected by T. gondii, and parasites that infect both humans infected animals harbor T. gondii tissue cysts. and warm-blooded animals. Human can become infected by ingesting tissue cysts from raw or undercooked meat (Hill et al., 2010). Over the past 20 years, the occurrence of T. spiralis infection in humans and pigs has decreased significantly in the U.S., although sporadic outbreaks still persist (Burke et al., 2008). However, the perception that pork may be infected with T. spiralis continues to be a food safety concern with some consumers. One of the most common parasitic infections in humans is toxoplasmosis. Toxoplasma gondii is the second leading cause of foodborne illnesses resulting in deaths (24%), accounting for an estimated 327 deaths annually. Toxoplasma is also the fourth leading cause of foodborne illnesses resulting in hospitalizations (8%), accounting for an estimated 4,428 hospitalizations annually (Scallan et al., 2011). 33", "Establishments that produce pork products should consider whether their suppliers have taken the necessary measures to prevent Trichinella infection in their herds. Pre-harvest management practices in the U.S. pork industry should include the recommended best practices described below:

Recommended Best Practices: Pre-harvest practices: \uf0b7 Do not feed table scraps, uncooked waste products, animal carcasses, or animal waste products contaminated with trichina \uf0b7

Prevent access to rodents and wildlife infected with *T. Gondi*, or to environmental contamination with cat feces such as soil, grass, feed, or water contamination (Jones et al., 2012) \uf0b7 Prevent exposure to rodents or other wildlife infected with *Trichina*; Rodents can serve as a reservoir host for *Trichinella* \uf0b7 Establish and maintain an effective rodent control program \uf0b7 Prevent cannibalism among hogs within an infected herd Recommended Best Practices: Slaughter \uf0b7 Obtain pork from suppliers with trichina-control programs 34", "Trichinella infection can also be controlled by post-slaughter processing interventions to inactivate the parasite (i.e., heating, freezing, irradiation, and high pressure processing). Participation by swine producers in the U.S. Trichinæ Certification Program is an alternative to controlling *Trichinella* infection in their herds. The U.S. Trichinæ Certification Program is a pork safety program that provides documentation of swine production management practices that reduce, eliminate, or avoid the risk of exposure of swine to zoonotic parasite *T. spiralis* (<http://www.aphis.usda.gov/vs/trichinæ>). This is a voluntary program for those producers, slaughter facilities, and other persons that handle or process swine from pork production sites that have been certified under the program. The standards of this program establish a set of criteria that enable producers to market swine that are not considered a risk to human health because of exposure to *T. spiralis*. These program standards were developed as a cooperative effort of the USDA agencies (Animal and Plant Health Inspection Service [APHIS], Agricultural Research Service [ARS], Cooperative States Research, Education and Extension Service [CSREES], Food Safety and Inspection Service [FSIS]) the National Pork Producers Council [NPPC], and the pork processing industry (USDA\APHIS, 2008). Recommended Best Practices: Post-Slaughter Processing Interventions \uf0b7 Heating \uf0b7 Freezing \uf0b7 Multi-Hurdle Steps (drying, curing\*, salting, fermenting) \uf0b7 Irradiation \uf0b7 High pressure processing (HPP) 9 CFR 318.10 -Prescribes the treatment of pork and products containing pork to destroy trichinæ. \*The effectiveness of curing to eliminate *T. spiralis* larvae is dependent upon a combination of various processing parameters and on the product formulation; specifically on the temperature and time of fermentation\drying and the salt level, respectively. Therefore, curing alone is not recommended as a post-slaughter intervention (Porto-Fett et al., 2010). An increasing number of swine are being raised in non-confinement systems because of increased consumer demand for \u201cfree-ranging,\u201d organically raised,\u201d and \u201chumanely raised\u201d pork products (Hill et al., 2012; Honeyman et al., 2006). In the U.S., the prevalence of *Toxoplasma* in confinement raised market hogs is approximately 2.7 % (Hill et al., 2010). For hogs raised on pastures, the prevalence has been reported to be between 50-100% (Gamble et al., 2000). The risk of *Toxoplasma* infection is significantly increased in pasture raised hogs that have access to rodents and wildlife infected with *T. gondii* or to environmental contamination with cat feces, such as soil, grass, feed, or water contamination (Jones et al., 2012). 35", "Feral pigs are also reservoirs of infection for *Trichinella* and *Toxoplasma* for nonbiosecure (or non-confinement) reared domestic hogs. Raising pigs outdoors poses a major risk for hogs being infected with *Trichinella* and *Toxoplasma* because it increases exposure to potentially infected reservoir hosts and to soil contaminated with *Toxoplasma* cysts (Hill et al., 2012; Gamble et al., 2000; Pyburn et al., 2005; Hill et al., 2010). The risk of *Trichinella* and *Toxoplasma* infection in market hogs can be substantially reduced by employing swine production practices that eliminate the sources of exposures of these parasitic hazards, thereby reducing the likelihood of human infection from

consumption of pork infected with *Trichinella* and *Toxoplasma*. XXXI. References

Introduction Recalls. A recall is a voluntary action conducted by a firm to remove adulterated or misbranded meat and poultry products from commerce. Although it is your company\u2019s decision to recall a product, the Food Safety and Inspection Service (FSIS), the public health regulatory agency within the United States Department of Agriculture (USDA), coordinates with you to ensure that you have properly identified and removed recalled product from commerce by verifying the effectiveness of your recall activities. FSIS also notifies the public about product recalls. There are three levels of meat and poultry recalls categorized by FSIS. The type of recall depends upon the potential risk to consumers. \u25ca Class I. There is a reasonable probability that eating the product will cause serious, adverse health consequences or death. Examples of a Class I recall include the presence of pathogens in ready-to-eat meat or poultry products or the presence of E. coli O157:H7 and other shiga-toxin producing E. coli O157:H7 or non-O157 STEC in raw ground beef. \u25ca Class II. There is a remote probability of adverse health consequences if the product is eaten. Examples of a Class II recall include the presence of very small amounts of undeclared allergens typically associated with milder human reactions, e.g., wheat or soy, or small-sized, non-sharp-edged foreign material in a meat or poultry product. \u25ca Class III. Eating the product will not cause adverse health consequences. An example of a Class III recall is the presence of undeclared ingredients, such as excess water in meat or poultry products. U.S. Department of Agriculture Food Safety and Inspection Service", "Small Plant News Guidebook Series INTRODUCTION A recall may be an alternative to FSIS detaining or seizing adulterated or misbranded products. However, if firms do not adequately remove a recalled product from commerce, a recall does not prevent FSIS from taking other appropriate actions, such as issuing public health alerts or detaining or seizing product to protect the public. The agency will also assess whether your recall strategy, or execution of that strategy, is effective. If it finds it is ineffective, FSIS may seek to bring an enforcement action against you or your consignees. FSIS has developed this guidebook and workbook to aid small and very small establishments that produce meat or poultry products in creating their plans for how they will conduct a recall should it become necessary for them to do so. The following information can be used to design and implement an effective recall plan. 6", "7 How to Develop A Recall Plan U.S. Department of Agriculture \ Food Safety and Inspection Service Recall Plans Title 9 of the Code of Federal Regulations, Part 418 (9 CFR 418), requires that official establishments that produce meat and poultry products prepare and maintain written recall plans. Under this regulation, your plan must specify how you will decide whether to conduct a product recall and describe the procedures that you will follow if you decide that a product recall is necessary. In addition, the regulations require that your plan be available to the FSIS inspector for review upon request. FSIS recommends that processed egg products plants also develop and maintain recall plans, although they are not explicitly required to do so by the regulation.", "How to

Develop A Recall Plan Small Plant News Guidebook Series Important Contact Information Recall Team. Your recall plan should contain a list of all your internal and external personnel who will be involved in a product recall. Include their roles and responsibilities, telephone numbers, fax numbers, and e-mail addresses. Be sure to appoint backups for each person. One person should be identified as the \u201crecall coordinator.\u201d This person may use another title, but the idea is to have one person in charge of recalls and recall planning. The recall coordinator will manage, maintain, and make changes to the recall plan as necessary. The recall coordinator should be knowledgeable about every aspect of the firm\u2019s operations, including purchasing, processing, quality assurance, distribution, and consumer complaints. The recall coordinator should be authorized to make decisions in carrying out a recall and should report to top management at regular, specified intervals. FSIS District Office. Your recall plan should include the telephone number of your local FSIS District Office. If you believe, or have reason to believe, that you have shipped adulterated or misbranded meat or poultry product into commerce, you are required to notify your local FSIS District Office within 24 hours. In addition, you must notify your local FSIS District Office if you believe that you have received adulterated or misbranded product, in accordance with 9 CFR 418.3. 8", "9 How to Develop A Recall Plan U.S. Department of Agriculture \u2014 Food Safety and Inspection Service Procedures for Determining a Recall Health Hazard Evaluation. Your plan must specify a method for determining how you will decide whether to conduct a recall if your product is adulterated or misbranded and is in commerce. Evaluating the nature and extent of the health risks associated with the product is one method for doing so. If you choose to assess the health hazards, you should take the following into account: \u25ca Whether any illness or injuries have already occurred from eating the product; \u25ca What hazards target various segments of the population, (e.g., children, the elderly, immune-compromised individuals, etc.), with particular attention paid to those individuals at greatest risk; \u25ca How serious is the health hazard to which the at-risk population would be exposed; \u25ca How likely is the hazard to occur; and \u25ca What would happen if it did. Here are some examples that you may want to consider when developing your recall plan. This list is not all inclusive, but it will help stimulate your thinking. \u25ca Undeclared allergen \u2013 What health hazards may arise if product shipped from your plant containing an undeclared allergen is consumed? \u25ca Consumer complaints \u2013 What are the health hazards if you receive a consumer complaint about a foreign material such as glass or metal in the product that has been shipped from your establishment? \u25ca Underprocessing \u2013 What are the health hazards if you discover that some of the products have been underprocessed? If your plant produces ready-to-eat product and raw product, will the hazards for these be different?", "10 How to Develop A Recall Plan Small Plant News Guidebook Series \u25ca Raw non-intact beef tests positive for E. coli O157:H7 or non-O157 STEC (both plant and FSIS test) \u25ca Ready-to-eat product tests positive for any pathogen (both plant and FSIS test) Scope of Recall. Your plan should also outline how you will determine the identity and amount of product to be recalled. It will be your responsibility to define when the problem began, when it was resolved, and what products are affected. Clean-up times do not necessarily define the scope of a recall. FSIS suggests that your plan specify how you will determine the amount of product affected by using various scenarios. Scenarios can include: the contamination of a vat of product with a foreign object, the use of an incorrect label, or the use of the same source of raw materials in other lots on other days of production.

When determining the amount of product affected, consider the following: "Your coding of product; The pathogen of concern; The processing and packaging; The equipment; The Hazard Analysis and Critical Control Point (HACCP) monitoring and verification activities (including microbiological testing) that you perform; Your Sanitation Standard Operating Procedure (SSOP) records; and Whether some, or all, of the products controlled by the same or substantially similar HACCP plans have been affected." "11 How to Develop A Recall Plan U.S. Department of Agriculture / Food Safety and Inspection Service Records. Records are vital in tracing product forwarded to consignees and back to potential suppliers. They include invoices, bills of sale, and shipping documents from each transaction in which product made with meat or poultry is purchased, sold, shipped, received, or handled by your plant in connection with any business subject to the Federal Meat Inspection Act or the Poultry Products Inspection Act. HACCP system records may also play a part in this process. Records you should have on hand include: Records needed to permit positive identification of products produced; Production records, including records on ingredients that are essential for traceback of products and ingredients of the products. All products need a system of product coding; this coding will facilitate an effective recall. Records of raw materials used in each lot of ground beef are especially important. Both you and public health authorities need to know if the problem is traceable to a supplier (refer to 9 CFR 320 and 9 CFR 381, subpart Q);" "12 How to Develop A Recall Plan Small Plant News Guidebook Series Distribution records that identify and locate shipped products that are recalled. These records should include at least the names and addresses of consignees, shipment method, date of shipment, and the amount of product shipped to each consignee. It is also useful to note which consignees are hospitals, restaurants, distributors, part of a chain, or independent retailers. Here's a practical example. If a recall of product is necessary because of contamination with Listeria monocytogenes, then a key factor in limiting the scope of the recall is whether the establishment (or retail store) is properly cleaning the equipment between lots. If not, there could be microbial contamination from one lot to another. Carefully maintained production records serve a vital public health purpose by giving the establishment and agency a means of pinpointing potential sources of contamination and providing greater accuracy in determining which products may be affected. Records that help product traceback: Production or grinding logs showing the times of each grind; Formulation or blend of raw ingredients, including amounts; Supplier lot identification; Finished product lot and subplot identification; and Any test results associated with either the raw materials or finished product. The records should indicate and track which lots or sublots of a grinding establishment's ground beef, including rework, and any other raw materials were used. The records should also track the amounts of each that were used." "13 How to Develop A Recall Plan U.S. Department of Agriculture / Food Safety and Inspection Service Recall Communications Recall Notice. FSIS recommends that your recall plan include an outline of the content of your recall notice. Please see sample recall notices on pages 16-18. When drafting the content of your recall notice, consider the following: Be brief and to the point; Clearly identify the product and any other pertinent descriptive information to enable accurate and immediate identification of the product, including: Product/brand name; Product code; Package/case size; Package/case date code; Lot number/expiration date; and Universal Product Code. Provide an

explanation of the risk if the product is eaten; \u25ca Concisely explain the reason for the recall and the hazard involved; \u25ca Provide specific instructions on what should be done with the recalled products; \u25ca Request an official, written response from consignees; \u25ca Provide a way for the recipient of the communication to report to the recalling firm whether it has any of the product, e.g., by allowing the recipient to place a collect call to the recalling operation; \u25ca The recall communication should not contain irrelevant qualifications, promotional materials, or any other statement that may detract from the message; and \u25ca Provide contact information for your firm (for questions). Your plan should also detail how the recall notification will be issued. For example, you can send your recall notice by e-mail, telephone, or", "14 How to Develop A Recall Plan Small Plant News Guidebook Series fax. Written notices should bear a prominent heading to indicate the importance of the communication. For example, a letter might bear a bold red declaration, such as \u201cURGENT FOOD RECALL.\u201d If communication is conducted by telephone, you should document and send a followup letter, e-mail, or fax to ensure that all bases are covered. Public Notification. FSIS recommends that you identify if and how the public will be notified of the recall. Recalls are often announced via a press release through national or local news media, or via a company website. Be sure to include contact information for all potential media, such as television stations, radio stations, and newspapers with local, State, and regional coverage areas, as well as the national wire services. If the actual contacts are not specified, then reference sources of current media contacts for all possible recall scenarios should be specified in the recall plan. The class of the recall and where the product was distributed will determine the type of notification you will use. Generally, distribution levels are categorized as wholesale, retail, hotel\restaurant\institutional (HRI) and consumer users. The more levels affected, the greater the need for different communication methods. At the wholesale level, the product is distributed to a warehouse or distribution center. This is the distribution level between the manufacturer and retailer. The retail level is when the product is received by the retailers for sale to the public. The HRI level is when the product was received by hotels, restaurants, or institutional customers. Lastly, the consumer level is when the product is sold directly to consumers. Regardless of the public notification action you take, FSIS will issue a press release for Class I and Class II recalls. FSIS will issue a Recall Notification Report if the recalled product has only been distributed at the wholesale level (and your firm is able to gain control of the product before it can be further distributed to the retail, HRI, or consumer level) and for Class III recalls. A Recall Notification Report is not distributed to the media.", "15 How to Develop A Recall Plan U.S. Department of Agriculture \ Food Safety and Inspection Service Control and Disposition of Returned Product Your recall plan should specify how the recalled product will be controlled pending disposition and disposal. If it will be destroyed after being returned, then notify FSIS prior to destroying the product in the event witnessing the product destruction is necessary. Recall Simulations The best way to test the effectiveness of your recall plan is to conduct a recall simulation that will help you identify any glitches in your recall plan. For example, you might find that a key fax or telephone number of a distributor or supplier has changed. Simulating a recall will keep your recall personnel alert and will familiarize everyone with recall procedures. A simulation will determine how quickly your company can identify and control a lot of affected product. If problems are identified during a recall simulation, then the recall plan should be revised and corrected. Simulations are necessary, and your recall plan will

falter without them. If you follow these guidelines, then you and your establishment should be ready in the event of a recall. Having a plan, familiarizing everyone with it, and implementing its procedures will keep you in control. Sample Recall Notices and Notification Letter and Worksheets. On pages 16-19, you will find sample Recall Notices and a Notification letter. You may use these as templates when designing your own Recall Notices and Notification Letters. On pages 20-24, you will find recall worksheets. You may use these for collecting pertinent information during a recall. In addition, a Recall Plan Workbook has been added to help you create a recall plan. The workbook can be found on pages 25-48. If you have any questions or concerns about developing your recall plan or need additional resources, contact FSIS\2019 Office of Outreach, Employee Education and Training through the Small Plant Help Desk at 1-877-FSISHelp (1-877-374-7435) or e-mail InfoSource@fsis.usda.gov. Also, visit the Small and Very Small Plant Web page at www.fsis.usda.gov to obtain information on training, workshops, and technical information to suit your needs. For additional information, you can also access FSIS Directive 8080.1, Recall of Meat and Poultry Products, from FSIS\2019 Web site at www.fsis.usda.gov/wps/wcm/connect/77a99dc3-9784-4a1f-b694ecf4eea455a6/8080.1.pdf?MOD=AJPERES. Hfuerschlinger@FuerschlingsBetterMeat.com Determining Whether a Recall is Necessary The Fuerschlinger\u2019s Better Meat Company will collect and analyze all information and data it has regarding product that may be recalled. It will take into account the following factors: \u2022 Has adulterated or misbranded product been produced? \u2022 Has adulterated or misbranded product been shipped? \u2022 Where has the product been shipped? \u2022 Is the product in commerce? \u2022 Is the product available to consumers? 28", "29 U.S. Department of Agriculture \ Food Safety and Inspection Service A Sample Recall Plan: The Workbook Scope of Recall Fuerschlinger\u2019s Better Meat Company will assess the amount and type of product that is implicated in a recall. When the problem involves contamination with microbial pathogens, the recall should include all products produced under a single Hazard Analysis and Critical Control Point (HACCP) plan between performance of complete cleaning and sanitizing procedures. However, the act of sanitation does not necessarily define the scope of all product removal actions. For instance, with E. coli O157:H7, the company will also consider the use of source materials. Some examples of how to define the scope of product removal actions include: \u2022 Contamination of a vat of product with a foreign material; \u2022 Use of an incorrect label; or \u2022 Use of the same source of raw materials, in other lots, on other days of production. In addition, the Fuerschlinger\u2019s Better Meat Company will consider such factors as: \u2022 Coding of product; \u2022 Pathogen of concern; \u2022 Processing and packaging; \u2022 Equipment; \u2022 Our HACCP plan monitoring and verification activities (including microbiological testing); \u2022 Our Sanitation Standard Operating Procedure (SSOP) records; and \u2022 Whether some or all of the products controlled by the same or substantially similar HACCP plans have been affected. The plan will specify how the company will determine the scope of the implicated product for various scenarios and contingencies.", "Small Plant News Guidebook Series Small Plant News Guidebook Series A Sample Recall Plan: The Workbook Records Company records are maintained in our office at 123 Brown Rd., Springfield, OH 12345. They are kept for a period of time that exceeds the shelf-life and expected use of our products and in accordance with FSIS regulations 9 CFR 320 and 9 CFR 381.175, and contain the following information: \u2022 Positive identification of products; \u2022 Distribution records (e.g., bills of sale, invoices, shipping papers, etc.); and \u2022 Production records that facilitate traceback of products and product ingredients. All of our records include the names and addresses of consignees, shipment methods, and dates of shipment. In addition, we maintain records of all of our suppliers of ground beef (e.g., names and lot numbers of suppliers, and production dates) in accordance with FSIS Directive 10,010.1. 30", "31 U.S. Department of Agriculture \ Food Safety and Inspection Service A Sample Recall Plan: The Workbook Depth of Recall The Fuerschlinger\u2019s Better Meat Company Recall Committee has developed a number of scenarios to determine the depth of the recall. Since they are proprietary designs, they are maintained in our office at 123 Brown Rd., Springfield, OH 12345. In the event of a recall, they will be made available to regulatory agencies upon request. The depth of a recall depends on the degree of hazard, the extent of distribution, and the level to which the recalled product was distributed. Levels of recall depth are categorized as: \u2022 Wholesale level: Product has been distributed to a warehouse or distribution center where it is not under the direct control of the producing company. \u2022 Retail level: Product has been received by retailers for sale to household consumers. \u2022 HRI level: Product has been received by hotels, restaurants, and institutional (HRI) customers. \u2022 Consumer level:

Product has been sold to consumers. Recall Communications We, at Fuerschlinger\u2019s Better Meat Company, consider the health and safety of our employees and the public our highest priority. As such, we have developed various communication methods to inform suppliers, consignees, and consumers about any product recalls we may be involved in. Please see the recall communication templates on pages 38-41. All of our communications will convey the following information: \u2022 If the product is subject to recall; \u2022 If further distribution or use of any remaining product should cease immediately;" "Small Plant News Guidebook Series Small Plant News Guidebook Series A Sample Recall Plan: The Workbook \u2022 If the direct consignee should, in turn, notify its consignees that received the product about the recall; \u2022 Instructions on what to do with the product; and \u2022 Our contact information (point of contact and telephone number). Recall Communication Implementation Fuerschlinger\u2019s Better Meat Company will attempt to contact all consignees or customers via the following methods (in this particular order) until a point of contact receives and acknowledges our communication: \u2022 Telephone; \u2022 E-mail; and \u2022 Fax. In addition, all consignees or customers shall be contacted via special delivery letters conspicuously marked (on the letter or envelope) \u201cURGENT \u2013 FOOD RECALL.\u201d Follow-up communications shall be sent to consignees or customers who fail to respond to initial recall communications within 24 hours. 32", "33 U.S. Department of Agriculture / Food Safety and Inspection Service A Sample Recall Plan: The Workbook Recall Communication Content All recall communications will be written in accordance with the following guidelines: \u2022 Be brief and to the point; \u2022 Clearly identify the product and any other pertinent, descriptive information including: o Product\brand name; o Product code; o Package\case size; o Package\case date code; o Lot number\expiration date; and o Universal Product Code (UPC). \u2022 Describe the risk involved in consuming the product; \u2022 Concisely explain the reason for the recall and the hazard involved; \u2022 Provide specific instructions on what should be done with the recalled product; \u2022 Request an official, written statement from consignees; \u2022 Provide a means for consignees (and other communication recipients) to report whether or not they have any of the product under their control; and \u2022 Include our company\u2019s contact information and a point of contact." "Small Plant News Guidebook Series Small Plant News Guidebook Series A Sample Recall Plan: The Workbook Responsibility of Recipient Consignees or customers who receive a recall communication should immediately carry out all instructions provided and, where necessary, extend the recall to their consignees or customers. Public Notification The class of a recall and the extent to which the product was distributed in commerce will determine the distribution of public notification by FSIS. Fuerschlinger\u2019s Better Meat Company will decide if the company will issue its own press release in addition to the Recall Release or Recall Notification Report issued by FSIS and how it will be issued. Public notification templates may be found on Pages 38-41. Effectiveness Checks In an effort to assess the progress and effectiveness of a recall, FSIS will conduct effectiveness checks to verify that all consignees (at the determined recall depth) have received notification about the recall and have taken appropriate action. Regardless of the recall scenario, all consignees will be contacted via the following methods (in this particular order) until we receive written acknowledgment from them: \u2022 Telephone call; \u2022 E-mail or Fax; \u2022 Special delivery letters; and \u2022 Personal visit. 34", "35 U.S. Department of Agriculture / Food Safety and Inspection Service A Sample Recall Plan: The Workbook

Fuerschlinger\u2019s Better Meat Company will consider the following information in regards to the recall effectiveness check process:

- \u2022 How much product is implicated in the recall?
- \u2022 How is the product identified to our customers\retailers (e.g., lot markings)?
- \u2022 How many locations did we ship the product to and where are they?
- \u2022 How did we communicate the product removal action to those who received it?
- o Did we document this contact?
- o Did we ask for and receive written acknowledgment from them?
- \u2022 What actions were taken with the product and by whom?
- \u2022 If product was destroyed, then was destruction witnessed and documented?
- o Were FSIS inspection program personnel present?
- \u2022 Is there a written record of:
- o When the issue was identified?
- o When customers were notified?
- o When we received notification that the product was either placed on hold or was no longer in a customer\u2019s control?
- \u2022 Can we account for most (or all) of the product?"

"Small Plant News Guidebook Series Small Plant News Guidebook Series A Sample Recall Plan: The Workbook Returned Product Control and Disposition Fuerschlinger\u2019s Better Meat Company will specify how the recalled product will be disposed of and how it will be controlled pending disposition. FSIS should be notified prior to disposition actions, which may include destruction or relabeling of product that is returned. If the product is destroyed, it will be rendered inedible for humans and animals. All labeling will be made unusable for trade.

36", "37 U.S. Department of Agriculture \ Food Safety and Inspection Service A Sample Recall Plan: The Workbook Recall Simulations Fuerschlinger\u2019s Better Meat Company will conduct biannual simulation exercises to evaluate our recall plan. The simulated recall will involve the selection, without prior notice to personnel involved in the exercise, of at least one product lot that has been distributed in commerce. A hypothetical reason for recalling the product will be specified and will involve the activation of the recall plan. The simulation will proceed at least to the point at which communication is made beyond the firm\u2019s organizational limits (full details of who will be contacted and how this will be established will be specified prior to the start of the exercise). In addition, the recall simulation exercises will include scenarios in which the recalled product has been shipped beyond the firm\u2019s initial customer to one or more of the consignee\u2019s customers. A recall simulation file is maintained by Fuerschlinger\u2019s Better Meat Company to record the details and results of all simulated recall exercises. It includes the following information:

- \u2022 Name, address and telephone number of clients (of the test lot);
- \u2022 Production records;
- \u2022 Inventory; and
- \u2022 Distribution of the test lot.

If problems are identified during a recall simulation exercise, our recall plan (and procedures) will be revised as necessary. The Fuerschlinger\u2019s Better Meat Company Recall Plan will be reviewed biannually and revised as necessary, when personnel, procedures, processes, and other factors change.

Recall Communication Templates

The enclosed recall communication templates on pages 38-41 will be used by the company to develop Letters to Customers and Press Releases relating to recalled product(s) during actual recalls and simulation exercises."

"Small Plant News Guidebook Series Small Plant News Guidebook Series A Sample Recall Plan: The Workbook RECALL COMMUNICATION TEMPLATE #1 Letter to Customers DATE CUSTOMER FIRM NAME & ADDRESS ATTN: CONTACT PERSON NAME & TITLE Re: RECALL OF TYPE OF PRODUCT Dear Sir or Madam: This letter is to confirm our telephone conversation that Fuerschlinger\u2019s Better Meat Company is recalling the following product because Specify Recall Reason: Describe the product, including name, brand, code, package size and type, establishment number, etc. We request that you review your

inventory records and segregate and hold the above product. If you have shipped any of this product, then we request that you contact your customers and ask them to retrieve the product and return it to you. Once you have retrieved all of the product, please contact us. We will arrange to have the product shipped to our facility. Please do not destroy the product. We will credit your account for returned products. We are undertaking this action in cooperation with the U.S. Department of Agriculture, Food Safety and Inspection Service (FSIS). FSIS officials may contact you to confirm that you have received this notice and are cooperating in this action. Your prompt action will greatly assist Fuerschlinder\u2019s Better Meat Company in this recall. If you have any questions, please do not hesitate to contact Sally Fuerschlinder at (123) 456-7890. Thank you for your cooperation. Sincerely, Hermann Q. Fuerschlinder, Owner 38", "39 U.S. Department of Agriculture \ Food Safety and Inspection Service A Sample Recall Plan: The Workbook RECALL COMMUNICATION TEMPLATE #2 Company Press Release

FUERSCHLINGER\u2019S BETTER MEAT COMPANY RECALLS [PRODUCT] DUE TO POSSIBLE LISTERIA CONTAMINATION [CITY], [DATE] \u2013 Fuerschlinder\u2019s Better Meat Company, a Springfield, Ohio, establishment, is recalling approximately [AMOUNT] pounds of [PRODUCT] that may be contaminated with Listeria monocytogenes]. The following products are subject to recall: \u2022 [IDENTIFYING INFO: TYPE OF CONTAINER, WEIGHT, \u201cBRAND NAME AND OTHER LABEL INFORMATION,\u201d ESTABLISHMENT NUMBER, CASE AND\OR DATE CODES] The products were produced [DATE] and distributed to [LEVEL OF DISTRIBUTION I.E. RETAIL ESTABLISHMENTS, INSTITUTIONS, ETC] in [STATES]. The problem was discovered through [SPECIFY HOW PROBLEM WAS DISCOVERED]. There have been [# or NONE] reports of illness associated with consumption of these products. Consumption of food contaminated with Listeria monocytogenes can cause listeriosis, an uncommon but potentially fatal disease. Healthy people rarely contract listeriosis. However, listeriosis can cause miscarriages and stillbirths, and can also cause serious and sometimes fatal infections in those with weak immune systems, such as infants, the elderly, persons with human immunodeficiency virus (HIV) infection, or those undergoing chemotherapy. Infection can spread to the nervous system, resulting in high fever, severe headache, neck stiffness, nausea, confusion and convulsions. Consumers with questions about the recall may contact the Fuerschlinder\u2019s Better Meat Company Consumer Representative, Alexandra Jones, at (123) 456-7890. PURPOSE This is a guide for preparing drawings or blueprints, supplemental information, and room specifications which are to be submitted for approval as outlined in 9 CFR 592.140, Regulations Governing the inspection of Eggs and Egg Products. Plant drawings are for the purpose of establishing the area of the new official plant, plant layout, types of construction, floor drainage, location and types of equipment, air systems and description of other principal facilities at the location. There are specific facility and equipment requirements provided throughout the regulations and in applicable 3-A and E-3-A Sanitary Standards and Accepted Practices. II. SUBMITTAL OF PLANS The applicant is to submit drawings and supplemental information for approval to the Frontline Supervisor responsible for oversight of the new official egg products plant as part of the Application for Federal Inspection Service for egg products. The drawings are to consist of complete floor plans and a plot plan. Supplemental information and room specifications are to accompany the drawings. Upon receipt of the submitted drawings, the supervisor will make a preliminary review to determine their accuracy and completeness. Any necessary changes or corrections will be requested by the supervisor. The supervisor will return drawings to the applicant for corrections before a final review. A final review and approval of the submitted drawings will be determined by the Frontline Supervisor. A final survey of the finished facility will also be conducted by the supervisor or a designee followed by the communication of

conformance with provisions of the approval and the regulations by the Frontline Supervisor.

III. GENERAL REQUIREMENTS The drawings may be regular blueprints or ink drawings on durable-weight drawing paper. The sheet size of the print should not exceed 34 by 44 inches. The wording on each print is to be legible, all lines sharp and clear, and drawings properly drawn to scale. When blueprints are prepared, we recommend the plant keep the original drawings for future use. If revisions then become necessary at a later date, changes can be made on the original drawing and new copies prepared and submitted. This would eliminate the need for preparing complete new drawings and also reduce the use of overlays. Each individual prints is to show: (1) the scale used; (2) the north point of the compass; and (3) the firm name, street, city, State, and ZIP code, or an accurate description of the

location.", "DRAWING \u2013 BLUEPRINT GUIDE 2 IV. PLOT PLAN The plot plan of the entire premises is to include: A. The location of all buildings, roadways, alleys, drains, catch basins, wells, reservoirs, storage tanks, and any other major structure. B. Nearby buildings and types of businesses located on adjoining property. C. The drainage and slope of terrain. D. The character and surfacing of roadways, driveways, streets, and loading areas (including the loading area for a refuse room), and the paved tanker truck bays (with drainage) for shipping and receiving tankers. The plot plan may be drawn to scale of 1\32 inch per foot. V. FLOOR PLAN A. The floor plan drawings are to include the entire plant. a drawing is required for each floor of the plant and should accurately illustrate and describe the facilities. Each room is to be identified.

Detailed prints for processing rooms should be drawn to a scale of 1\4 inch per foot. If a print includes only non-processing areas, it may be drawn to a scale of 1\8 inch per foot. Include the names of other firms, if any, occupying the building, their type of business, and the space occupied by them. If any rooms of the official plant will be used for purposes other than ones related to operation of the egg products plan, indicate this on the drawing and include a statement of explanation. B. Essential items to show on floor plans are the location of: 1. Walls, doors, hallways, stairways; 2. Intake and exhaust systems; 3. Hand washing facilities, floor drains, channel drains, toilet facilities, hose connections with hot and cold water for cleanup purposes; and 4. Storage tanks, conveyors, equipment racks, and other principal pieces of equipment. C. The prints should indicate the slope of floors to drains openings or channel drains by either grade lines or arrows. Floors which require drains shall slope more than 1\8 inch per foot to drains. Channel drains should have concave bottoms and must be self-draining. Channels should be at least 10 inches wide. They are to be provided with grates or covers designed for safety and efficient recovery of water. Prints for newly-constructed plants are to include the approximate location of all under floor or underground drainage lines. This may be added to the plot plan or floor plan of the entire plant.", "DRAWING \u2013 BLUEPRINT GUIDE 3

D. Air systems for providing a positive flow of filtered air to breaking rooms, product packaging rooms (except for dried egg white packaging rooms), and blending rooms are to be shown with the following detail: 1. Pickup points of outside air; 2. Locations of fans; 3. Locations of air filters; and 4. Air distribution points in the room 5. Including pickup points for return air The air system is to be designed to supply filtered, outside air at a reasonable working temperatures. An adequate volume of air is needed to \u2013 pressurize\u201d each processing room so that the air would move outward through any openings in the room. The filtered air should enter the room at a location which is opposite from the side where most of the air is expected to flow out of the room. Indicate the efficiency of the air filtration system. The location of all exhaust

fans is to be shown. If the exhausts are ducted, the ducts are to be shown. E. Show the location of air compressors supplying air to breaking machines, packaging equipment, vacuum systems, and all pickup points of outside air. This requirement is related only to product contact air or air for product contact surfaces. New installations (air compressors, air filters, etc.) are to meet the standards set forth in E-3-A accepted practices. F. The following require detailed drawing of equipment and facilities. Special items to be shown are:

1. Transfer rooms a. Shell egg washers connected directly to drains or piped to drains so waste water does not flow over the floor.
- b. Shell egg washers ducted or exhausted to the outside.
2. Egg breaking rooms a. The number of stations at hand breaking tables or individual breaking machines model numbers.
- b. Individual hand washing facilities.
- c. A detailed drawing of the pumping and reexamination system if liquid egg is pumped from the breaking machines. The drawing may be shown a supplemental print.
- d. The shell disposal system.
- e. Churns, strainers, and other principal pieces of equipment.

3. Equipment washing rooms or areas a. All wash tanks and the number of compartments of each which are used for cleaning equipment or containers. Indicate that these are provided with hot", "DRAWING \u2013 BLUEPRINT GUIDE 4 and cold water and have drain lines trapped and connected to the plant drainage system.

- b. Utensil and equipment drain and aeration racks.
4. Mixing, blending, and fermentation rooms a. The capacity of each liquid egg storage tank; whether each is insulated or refrigerated; horizontal or upright; whether each is equipped with an agitator, covers, and thermometers.
- b. The layout of pasteurizing system (press holding tubes, etc.).
5. Egg products packaging rooms a. Principal pieces of equipment (draw off tank, scales, etc.), hand washing facilities, floor drains, and hot and cold water outlets for cleanup purposes.
6. Edible ingredient area where ingredients are weighed and mixed
7. Egg product drier rooms a. Drier(s) and all component parts
- b. The locations of air inlets to the drier, air filters, exhaust, and heater. The type of head, i.e., steam, direct or indirect gas.
- c. The powder conveying system. If a pneumatic system, the source of air pickup, location of air filters, and type of powder cooling facilities if included as part of the system.
8. Dried egg products heat treatment room a. The location of heat sources, fans, and air distribution points.
- b. Temperature recording instrument data
9. Laboratory A11 air intake and exhaust systems and drains. The drainage system for bacteriological laboratories is not to be connected with other drainage lines within the plant. Describe briefly how laboratory wastes (dry and liquid) are handled for bacteriological laboratories. This can be added as supplemental information. (see section VI of this guide)
10. Rooms for handling and packaging of inedible egg The straining, mixing, and packing areas including hot and cold water connections for cleanup, floor drains, and a forced exhaust to the outside.
11. Shell and refuse disposal rooms Location of floor drains, hot and cold water connections for cleanup, and forced exhausts to the outside. These rooms are not to open directly into processing rooms.
12. Toilet facilities Exhaust fans, drainage lines, lockers, location of toilet bowls, etc. in new or remodeled construction, the drainage system from toilets is not to be connected with other", "DRAWING \u2013 BLUEPRINT GUIDE 5 drainage systems within the confines of the plant. Other acceptable sewage line safety devices may be acceptable in lieu of this requirement.
13. Office space for USDA inspector G. Rooms and areas requiring only layout drawing;

  1. Empty egg case storage,
  2. Shell egg cooler,
  3. Freezer,
  4. Dried product holding room or area,
  5. Edible ingredient storage room,
  6. Cleaning compound storage room or area,
  7. Insecticide and rodenticide storage room or area,
  8. Packaging material and can storage room,
  9. Hallways,
  10. Maintenance shop,
  11. Dressing

rooms and lunchrooms.

**VI. SUPPLEMENTAL INFORMATION** The following are examples of information which may be submitted as descriptive side notations on the prints or on supplemental enclosures. This is recommended as a means of clarifying the prints and to minimize information on the drawings so they can be easily read:

- A. Kind and description of pasteurizer and flow-diversion valve.
- B. Description of product contact surfaces of drying system or a statement that the product contact surfaces meet E-3-A standards for spray drying systems.
- C. Methods of adding free flowing ingredients and other edible ingredients to dried egg products.
- D. Type of temperature recording devices used for recording the temperature of dried products and heat treatment rooms.
- E. A statement that an ample supply of hot water is available for cleanup and full operation of the plant.
- F. Indicate that all floor drains are trapped.
- G. A statement that all lighting fixtures in processing rooms are fitted with protective devices.
- H. Indicate all doors of processing rooms are self-closing.
- I. Hand washing facilities in processing areas are operated by other than hand controls.
- J. For new facilities only. Submit the original and two copies of a water potability certification showing municipal water and\or each private well has been tested and found to be satisfactory under the authority of a State or municipal health agency, or by USDA.
- K. Forms will be provided for reporting information on sewage disposal and compliance with the Federal Water Pollution Control Act.
- L. Capacity of fans (CFM) for the air systems."

"DRAWING \u2013 BLUEPRINT GUIDE 6 M. A statement that the air compressor system meets E-3-A standards for product contact air.

- N. Describe what heating or air-condition facilities are provided for the plant.
- O. A statement that the drier systems meet E-3-A standards.
- P. Method of shell disposal.
- Q. Any other reference to E-3-A standards that may aid in the review of the blueprints.

**VII. ROOM SPECIFICATION SHEET** The following information is to be submitted in tabular form for each room and a copy attached to each set of prints (see enclosed sample);

- A. The height and type of ceilings.
